Yale and Harvard Universities became centres of aquatic energy very early in the history of American rowing. The first racing boat at Yale, a six-oar, was bought in 1843, and in the following spring Harvard purchased an eight, and in 1854 a race was rowed between a Harvard crew and three Yale crews at Lake Winnipesaukee, which resulted in a victory for the former. In 1859 Harvard again defeated Yale in a six-oared race, but on the following day at Worcester City Regatta the same crews entered for a prize and Yale defeated Harvard. In 1864 at a college regatta Yale defeated Harvard, but in 1866 Harvard with a very fine crew showed their superiority over all the other colleges. In 1869 Harvard sent a challenge to Oxford and Cambridge to row a four-oared match on the Thames from Putney to Mortlake. It was accepted by the former and the race was rowed on the 27th of August. The race aroused great public interest, and the banks of the river were crowded from end to end of the course. The crews were: Oxford, F. Willan (bow), A. C. Yarborough, J. C. Tinné and Darbishire (stroke); Harvard, J. S. Fay (bow), E. G. Lyman, W. H. Simmons and A. P. Loring (stroke). Harvard led at first, but Oxford eventually rowed them down and won by three lengths.

The trip of the Harvard four to England aroused the rowing enthusiasm of other American universities such as Princeton, Cornell, Columbia and Pennsylvania, and during the next ten years considerable improvement was shown in American rowing. In 1875 no fewer than thirteen university or college crews competed in a race, in which Cornell finished first, Columbia second and Harvard third, the ships used being six-oars without coxswains. In 1876 the eight-oared match over a four-mile course between Harvard and Yale was instituted, and in 1878 a four from Columbia University went to Henley and won the Visitors Challenge Cup. In 1879 and 1880 there were a very large number of inter-collegiate matches and regattas, in several of which Columbia maintained the reputation which they had gained at Henley. In 1881 a Cornell four started at Henley for the Stewards Cup, but were easily beaten. During the next few years there was considerable difference of opinion between universities as to the correct style of stroke, and in 1882 a Yale crew, coached by Mr. Davis, did some fine performances, rowing a very fast short stroke in a very long boat. They were, however, eventually beaten by Harvard after an exciting race, in which it was only fair to them to record that the erratic steering of their coxswain contributed in no small degree to their defeat. The next year, 1883, Yale tried an even faster and shorter stroke, but were easily beaten by Harvard, who rowed with great length and steadiness. This year saw the end of the very fast short stroke, and although the "strokes" of the various crews since that day have differed in minor degrees, they settled down to a longer steadier method of rowing which is spoken of in England as the "Wingfield" and differs from that adopted by English oarsmen in that there is an absence of swing and body work, and in that the oarsmen appear to rely almost entirely upon their long slides and hard leg work. In the early "nineties" Cornell was almost always successful at home, and in 1895 they entered for the Grand Challenge Cup at Henley. Owing to a misunderstanding at the start the Leander crew were left at the post in the first heat, but on the next day Cornell suffered defeat at the hands of Trinity Hall. In 1896 Yale entered at Henley under the tuition of Cook, but were somewhat easily beaten by Leander. The result of these two expeditions to Henley was an attempt to introduce the English style of rowing in America. The experiment was not altogether successful. Mr. R. C. Lehmann, who had met with considerable success in England as a coach both at Oxford and Cambridge, went to Harvard for the season. The attempt to instruct the American oarsmen in the English methods of swing and body work, instead of the American stroke, resulted in their falling short of perfection in either style, and they were beaten by Yale upon each occasion. Mr. Lehmann's visit, if it failed to give pace to the crews he coached, resulted, however, in improving the whole spirit of American college rowing. Mutual confidence and friendly rivalry took the place of the atmosphere of suspicion and almost of enmity which had at times existed between Harvard and Yale. In 1895 an Inter-collegiate Rowing Association was formed by
Cornell, Columbia and Pennsylvania to organise contests at Poughkeepsie open to all colleges. In 1899 and 1900 Pennsylvania entered in 1902, 1903 and 1908 Syracuse, and in most other years Cornell. The two annual inter-collegiate regattas are the Harvard-Yale at New London, and that at Poughkeepsie, open to all but not participated in by Harvard and Yale. By way of exception, Harvard rowed at Poughkeepsie in 1896, and in 1897 and 1898 Cornell rowed in two regattas. In 1901 Pennsylvania was just beaten by Leander Club in the race for the Grand Challenge Cup at Henley.

The history of amateur rowing in the United States, other than that of the colleges and universities, is a narrative of continual struggles on the part of the authorities to distinguish between the amateur and the non-amateur. The National Association of Amateur Oarsmen was established in 1872. Many regattas have been held since that date under their rules, but the standard of amateurism which satisfied the N.A.A.O. has never been strict enough to comply with the requirements of the English A.R.A. or the Henley Stewards. In 1883 a Hillsdale four from U.S.A. tended an entry at Henley, but it was refused by the Stewards, on the ground that the men were not amateurs according to the English definition. In subsequent years several American scullers entered for the Diamond Sculls, and in 1897 they were won by E. H. Ten-Eyck of Wachusett Boat Club, Worcester, U.S.A. In 1898 Ten-Eyck's entry was refused by the Henley Stewards. No little resentment has been caused in America by the reluctance of the English authorities to accept American entries, but their justification lies in the essential difference, not only in letter but in spirit, between the laws and customs of the two countries with regard to the amateur status and amateur sport. In 1904 a crew of the Vesper B.C. of Philadelphia were duly vouched by the N.A.A.O. and their entry accepted by the Henley Stewards. They competed and were beaten, and it afterwards became known that not only had several of the men made money out of the trip, but that two or three of the oarsmen were not qualified to row at Henley. It also appeared that certain members of the N.A.A.O. had, to say the least of it, been extremely careless in giving assurances as to the status of the Vesper crew, and all relations between the N.A.A.O. and the Henley Stewards were abruptly terminated, the Stewards determining that they would not accept foreign entries except from a country where there was a governing body which had control of amateur rowing and which had an agreement with the Stewards by which they definitely pledged themselves not to send competitors to Henley unless they came within the English definition. In 1906 Harvard challenged Cambridge. The race, which attracted an immense concourse of spectators, was rowed from Putney to Mortlake in September. Cambridge led from the start and won by three lengths.

Rowing in other Countries.—During the latter years of the 19th century and during the early years of the present century, rowing increased very greatly in popularity as a branch of athletic sport in every quarter of the globe. It would be impossible here to describe the history or organization of boat clubs in Canada, Australia, and the other English-speaking countries of Europe. Canadian rowing has always been of a high class. In 1904 L. Scholes, a Canadian sculler, won the Diamond Sculls at Henley, and on several occasions Canadian eights and fours have competed for the Grand Challenge and Stewards Challenge Cups at Henley. In Australia they have a regatta which is called the "Australian Henley," and an inter-university contest for a cup presented by Oxford and Cambridge oarsmen. In Europe international championships have been instituted in the hope of bringing together oarsmen and scullers from all countries. The Belgian oarsmen have by their Henley successes achieved the greatest distinction among continental oarsmen. In Holland the principal rowing clubs have their headquarters at Amsterdam, and several Dutch crews have been seen at Henley. In France there are innumerable rowing clubs which are now governed by the Fédération française, a body which has a strict code of rules, but which has not adopted quite so strict an amateur definition as that of the English A.R.A. In Germany, also, rowing is very extensively practised under the auspices of the Deutsche Ruderverband; the chief contests between English and German crews of recent years were at the Cork Regatta of 1902 when Leander Club defeated the Berlin Club in the eight-oared race, and at the Henley Regatta of 1907, when a four of the Ludwigsafenner Club were defeated in a heat of the Stewards Cup by a Leander crew.

Methods and Style.—The English style is the only one in which the oarsman swings his body to the full extent fore and aft, at the same time making use of his sliding seat. Most of the foreign crews who have competed in England have sacrificed a portion of their swing in order to enable them, as they believe, to make better use of their leg work. There can be no doubt that the English style is in a sense more exhausting to the oarsman, that is to say it enables him to bring more muscle into play and to make full use of his weight and strength, but in spite of recent defeats it is still believed by English oarsmen to be the most effective. The crews of 1906 and 1907, which were defeated by the Belgians were the best that England could at the time produce, but they undoubtedly rowed in a style which fell a long way short of ideal English rowing. The secret of good rowing is the simultaneous application of leg and body work from end to end of the stroke. The instant the blades are covered the whole weight must be lifted from the stretcher and applied to the oar-handle, and must remain so applied until the hands come in to the chest. In order to ensure that the pressure so applied to the blade shall be as long and as hard as possible, the body must be swung forward to its full extent, and during the stroke the shoulders must always be swinging back faster than the seat, while at the same time the legs are driving hard at the stretcher. The slide and stroke should be finished simultaneously. There are many subsidiary rules of style as to the movements of the hands and arms, but they are all of secondary importance and are devised so as to enable the average man to execute the working portion of the stroke effectively and often, without undue exertion to himself. The movements of a crew must be as nearly as possible simultaneous in every particular. There have been many instances of crews which although inferior in style and strength to their opponents have been victorious owing to being "better together."

ROWLAND, HENRY AUGUSTUS (1848-1901), American physicist, was born at Honesdale, Pennsylvania, on the 27th of November 1848. From an early age he exhibited marked scientific taste and spent all his spare time in electrical and chemical experiments. At the Rensselaer Polytechnic Institute at Troy, N.Y. he graduated in 1870, and then obtained an engagement on the Western New York railway. But the work there was not to his liking, and after a short time he gave it up for an instructorship in natural science at the university of Wooster, Ohio, which in turn resigned in order to return to Troy as assistant professor of physics. Finally, in 1876, he became the first occupant of the chair of physics at the Johns Hopkins University, Baltimore, a position which he retained until his premature death on the 16th of April 1901. Rowland was one of the most brilliant men of science that America has produced, and it is curious that at first his merits were not perceived in his own country. In America he was unable even to secure the publication of certain of his scientific papers; but Clerk Maxwell at once saw their excellence, and had them printed in the Philosophical Magazine. When the managers of the Johns Hopkins University asked advice in Europe as to whom they should make their professor of physics, he was pointed out in all quarters as the best man for the post. In the interval between his election and the assumption of his duties at Baltimore, he studied physics under Helmholtz at
ROWLANDS, R.—ROWLANDSON 787

Berlin, and carried out a well-known research on the effect of an electrically charged body in motion, showing it to give rise to a magnetic field. As soon as he did this he was settled at Baltimore, two important pieces of work engaged his attention. One was the determination of the ohm. For this he obtained a value which was substantially different from that ascertained by the committee of the British Association appointed for the purpose, but ultimately he had the satisfaction of seeing his own result accepted as the more correct of the two. The other was a new determination of the mechanical equivalent of heat. In this he used Joule's paddle-wheel method, though with many improvements, the whole apparatus being on a larger scale and the experiments being conducted over a wider range of temperature. He obtained a result distinctly higher than Joule's final figure; and in addition he made many valuable observations on thermometric questions and on the variation of the specific heat of water, which J. P. Joule had assumed to be the same at all temperatures. In 1882, before the Physical Society of London, he gave a description of the diffraction gratings with which his name is specially associated, and which have given him an enormous advantage to astronomical spectroscopy. These gratings consist of pieces of metal or glass ruled by means of a diamond point with a very large number of parallel lines, on the extreme accuracy of which their efficiency depends. For their production, therefore, dividing engines of extraordinary trueness and delicacy must be employed, and in the construction of such machines Rowland's engineering skill brought him conspicuous success.

The results of his labours may be found in the elaborate Photographic Map of the Normal Solar Spectrum (1888) and the Table of Solar Wave-Lengths (1898). In the later years of his life he was engaged in developing a system of multiplex telegraphy.

ROWLANDS, RICHARD (fl. 1560-1620), Anglo-Dutch antiquary, whose real name was Verstegen, was the son of a cooper whose father, Theodore Roland Verstegen, a Dutch engraver, emigrated to England about 1520, under the name of Rowlands, Richard went to Christ Church, Oxford, in 1565, where he studied early English history and the Anglo-Saxon language. Leaving the university without a degree, he published in 1576 a work of antiquarian research, translated from the German, entitled The Post of the World, describing the great cities of Europe; and soon afterwards he moved to Antwerp, where he resumed the name of Verstegen, and set up in business as a printer and engraver. In 1597 he went to Paris, and in 1598 to Spain, where he studied in the college at Seville, afterwards returning to Antwerp, where he lived so far as is known until his death, the date of which, though certainly later than 1620, is unknown. Rowlands was a zealous Roman Catholic, and in 1587 he published at Antwerp Theatrum Crudelitatum haereticorum, in which he criticized the treatment of the Roman Catholics in England under Elizabeth so freely that when a French translation of the book appeared in the following year he was thrown into prison at the instance of the English ambassador in Paris. Many of his writings were published in the name of Verstegen. His works included A Dialogue on Dying Well (1603), a translation from the Italian; Restitution of Decayed Intelligence in Antiquities concerning the English Nation, dedicated to James I. (1605); Neder Duitsche Epigrammen (1617); Sundry Successive Regal Governments in England (1620); Spiegel der Nederlandsche Elenden (1621). The verses on the defeat of the Irish rebels under Tyrone, entitled England's Joy, by R. H. (1601), is doubtfully attributed to him. Richard Verstegan, author of Nederlandische Antiquiteitten (Brussels, 1846), is probably another person, possibly Rowland's son.

ROWLANDS, SAMUEL (c. 1573-1610), English author of pamphlets in prose and verse, which reflect the follies and humours of the lower middle-class life of his time, seems to have had no contemporary literary reputation; but his work throws considerable light on the social London of his day. Among his works, which include some poems on sacred subjects, are: The Betraying of Christ (1598); The Letting of Humours Blood in the Head-vaune (epigrams and satires) and A Merry Meeting, or 'tis Merry when Knees mete (1600)—the latter being publicly burnt by order, but republished later under other names—(Humors Ordinaries and The Knave of Clubbes); Greene's Ghost haunting Conic-Catchers (1602), which he pretended to have edited from Greene's papers, but which is largely borrowed from his printed works; Tit Merrie when Gossipis meete (1602), a dialogue between a Widow, a Wife, and a Vintner; Looke to it; for Ie stabbe ye (1604), in which Death describes the tyrants, careless divines and other evil-doers whom he will destroy; Hells broke loose (1605), an account of John of Leyden, and in the same year a Theatre of Divine Recreation (not extant), poems founded on the Old Testament; A Terrible Battell betweene ... Time and Death (1606); Democritus, or Doctor Merry-man his Medicines against Melancholy humors, republished, with alterations, as Doctor Merrie-man, and Diogenes Lanthorne (1607), in which "Athens is Famous History of Guy, Earl of Warwick (1607), a long romance in Rowland's favourite six-lined stanza, and one of his lastest, least successful efforts; Humors Looking Glasse (1608); and Martin Mark-all, Beadle of Bridewell (1610), a history of roguary containing much information about notable highwaymen and the complete vocabulary of thieves' slang up to that time. Of his later works may be mentioned Sir Thomas Overbury; or the Poysoned Knights Complaint, and The Melancolike Knight (1615), which suggests a hearing of Beaumont and Fletcher's Knight of the Burning Pistle. The last of his humorous studies, Good Neues and Bad Neues, appeared in 1613, and in 1618 he published a pious volume of proverbs and verse, entitled A Groene Glory, Stoke his Body, Flye his Soul. Hells Horror, Fure it. After this nothing is known of him. Mr. Gosse, in his introduction to Rowland's complete works, edited (1872-80) for the Hunterian Club in Glasgow by Mr. S. J. H. Herbage, sums him up as a "kind of small non-political Defoe, a pamphleteer in verse whose talents were never put into exercise except when their possessor was pressed for means, and a poet of considerable talent without one spark or glimmer of genius."

Mr. Gosse's notice is reprinted in his Seventeenth Century Studies (1883). A recently discovered poem by Rowlands, The Bride (1617), was reprinted at Boston, U.S.A., in 1905 by Mr. A. C. Potter.

ROWLANDSON, THOMAS (1750-1827), English caricaturist, was born in Old Jewry, London, in July 1756, the son of a tradesman or city merchant. On leaving school he became a student in the Royal Academy. At the age of sixteen he resided and studied for a time in Paris, and he afterwards made frequent tours on the Continent, bringing his portfolios with various portraits and landscapes. Possessed of much facility of execution and a ready command of the figure, he was spoken of as a promising student; and had he continued his early application he would have made his mark as a painter. But by the death of his aunt, a French lady, he fell heir to a sum of £7,000, plunged into the dissipations of the town and was known to sit at the gaming-table for thirty-six hours at a stretch. In time poverty overtook him; and the friendship and example of Gillray and Bunbury seem to have suggested caricature as a means of filling an empty purse. His drawing of Vauxhall, shown in the Royal Academy exhibition of 1784, had been engraved by Pollard, and the print was a success. Rowlandson was largely employed by Rudge, the art publisher, who in 1806-11 issued in his Poetical Magazine "The Schoolmaster's Tour"—a series of plates with illustrative verses by Dr. William Coombe. They were the most popular of the artist's works. Again engraved by Rowlandson himself in 1812, and issued under the title of the "Tour of Dr Synta
in search of the Picturesque," they had attained a fifth edition by 1813, and were followed in 1820 by "Dr Syntax in Search of a Wife." The same collaboration of designer, author and publisher appeared in 1821 with the English version of the "Dramatist," issued in 1814-15 of one of the most admirable of Rowlandson's series and in the "Dance of Life." Rowlandson also illustrated Smollett, Goldsmith and Sterne, and his designs will be found in "The Spirit of the Public Journals" (1815), "The English Spy" (1825), and "The Humourist" (1831). He died in London, after a prolonged illness, on the 22nd of April 1827.

Rowlandson's designs were usually executed in outline with the red-pen, and delicately washed with colour. They were then etched by the artist on the copper, and afterwards aqua-tinted—usually by a professional engraver, the impressions being finally coloured by hand. As a designer he was characterized by the utmost facility and ease of draughtsmanship, and the quality of his art suffered from this haste and over-production. He was a true if not a very refined humorist, dealing less frequently than his heroic contemporary Gillray with politics, but commonly touching on a rather gentle spirit, the various aspects and incidents of social life. His most artistic work is to be found among the more careful drawings of his earlier period; but even among the exaggerated caricature of his latest time, we find instances that the humorist's mind had been attuned to the beautiful he so willed. See J. Grego, "Rowlandson the Caricaturist, a Selection from his Works," 2 vols., 1880.

ROWLEY, WILLIAM (c. 1585-1642), English actor and dramatist, with several of the dramatists of the Elizabethan period, especially with Thomas Middleton. He is not to be identified with "Master Rowley, once a rare scholar of learned Pembroke Hall in Cambridge," whom Francis Meres described in his "Palladium Tamia" as one of the "best for comedy." The only Rowley at Pembroke Hall at the period was Ralph Rowley, afterwards rector of Chelsmford. William Rowley is described as the chief comedian in the Prince of Wales's company, and it was doubtless during their two years' union (1614-16) of these players with the Lady Elizabeth's company that he was brought into contact with Middleton. Rowley joined the King's Servants in 1623, and retired from the stage about four years later. The fact of his marriage is recorded in 1637, and he is supposed to have died about 1642. Four plays attributed to his sole authorship are extant: "A New Woman" (printed 1636); "Rowley's Midnight" (1633); "A Tragedy called Alls Lost by Lust" (1633); and a "Shoemaker a Gentleman with the Life and Death of the Cripple that stole the Weathercock at Psalms" (1638). They are distinguished by effectiveness of situation and ingenuity of plot, so that we may conjecture why he was in such request as an associate in play-making, and he had further an experimental knowledge of the coarse comedy likely to please the public. It is recorded by Langhaine that he "was beloved of those great men Shakespeare, Fletcher and Jonson." The plays he wrote with Middleton are dealt with under that heading. With George Wilkins and John Day he wrote "The Travails of the Three English Brothers" (1607); with Thomas Heywood he produced the romantic comedy of "Fortune" by Land and Sea (printed, 1655); he was associated with Thomas Dekker and John Ford in "The Witch of Edmonton" 1 (printed, 1658); "A Cure for a Cuckold" (printed, 1661) and "The Thracian Wonder" (printed, 1661) are assigned to the joint authorship of Webster and Rowley; while Shakespeare's name was unjustifiably coupled with his on the title-page of "The Birth of Merlin: or, The Child hath found his Father" (1662). Rowley also wrote an essay on Hugh Atwell, the actor, and a satirical pamphlet describing contemporary London, entitled "A Search for Money" (1609).

The dramatist Samuel Rowley, described without apparent reason by J. P. Collier as "William Rowley's brother," was employed by Henslowe as a reader of plays. He wrote some scriptural plays now lost, with William Borne (or Bird, or Boyle) 2 and Edward Juby. His only extant piece is: "When you see me, You know me. Or the famous Chronicle History of King Henry the eight, with the birth and virtuous life of Edward Prince of Wales" (1608), of interest because of the presence of the Shakespearean play of "The Life of Henry VIII., and The Noble Souldier. Or, A Contract Broken, justly reveng'd" (1634), which was entered, however, in the Stationers' Register as the work of Thomas Dekker, to whom the major share is probably assignable.

ROWLEY REGIS, an urban district in the Kingswinford parliamentary division of Staffordshire, England, on the Stourbridge branch of the Great Western railway, 7 m. W. of Birmingham, Pop. (1901) 34,670. It lies in a hilly district rich in coal and iron, while a hard basaltic intrusion known as Rowley rag is largely quarried. The town is a modern growth out of a village surrounding the church of St Giles, which dates from the 13th century, though rebuilt in 1840. Iron manufactures are extensive and there are also brick and tile works and breweries.

ROWLOCK (a pronounced rollock or rollock), a device on the gunwale of a boat in or on which an oar rests, forming a fulcrum for an oar in rowing. The word is a corruption due to "row" of the earlier "oar-lock," O. E. arloc, a lock or enclosed place for an oar. The simplest form of rowlock is a notch, square or rounded, on the gunwale, in which the oar rests; other kinds are formed by two pins or pegs, "thole pins" (those being ultimately the same word as Norw. toll, a young fir-tree), and by a swivel with two horns of metals, pivoted in the gunwale or on an outrigger (see Oar).

ROWTON, MONTAGUE WILLIAM LOWRY-CORRY, BARON (1838-1903), second son of the Right Hon. Henry Corry by his wife Harriet, daughter of the 6th Earl of Shaftesbury, was born in London on the 8th of October 1838, educated at Harrow and at Trinity College, Cambridge, and called to the bar in 1863. His father, a son of the 2nd Earl of Belmore, represented County Tyrone in parliament continuously for forty-seven years (1856-73), and was a member of Lord Derby's cabinet (1866-68) as vice-president of the council and afterwards as first lord of the Admiralty. Montague Corry was thus brought up in close touch with Conservative party politics; but it is said to have been his winning personality and social accomplishments rather than his political connections that recommended him to the favourable notice of Disraeli, who in 1866 made Corry his private secretary. For this time his companions were Gladstone and the Conservative chancellor of the exchequer. After the fall of the Disraeli ministry in 1880 Corry maintained his connexion with Disraeli, the relations between the two men being more intimate and confidential than usually subsist between a private secretary and his political chief. When Disraeli resigned office in 1868 Corry declined various offers of public employment in order to be free to continue his services, now given gratuitously, to the Conservative leader; and when the latter returned to power in 1874, Corry resumed his position as official private secretary to the prime minister. He accompanied Disraeli (then earl of Beaconsfield) to the congress of Berlin in 1878, where he acted as one of the secretaries of the special embassy of Great Britain. On the defeat of the Conservatives in 1880, Corry was raised to the peerage with the title of Baron Rowton, of Rowton Castle, Shropshire. He had rendered service of an exceptional order to his chief, and after Beaconsfield's removal to the House of Lords his private secretary became invaluable in keeping him in touch with the rank and file of his party. Lord Rowton was in Algiers when Beaconsfield was stricken with his last illness in the spring of 1881; but returning post-haste across Europe, he was present at the death-bed of his old chief. Beaconsfield (q.v.) bequeathed to Rowton all his correspondence and other papers.

Lord Rowton will long be remembered as the originator of the scheme known as the Rowton Houses. Consulted by Sir

1 It is usual to minimize Rowley's share in this play. Mr Seccombe ("Dict. Nat. Biog., s.a. Rowley") says: "Dekker appears to have had the chief share, but Rowley supplied some acceptable buffoonery." J. O. Halliwell-Phillips ("Dict. of Old English Plays"), however, defined it as a tragi-comedy by William Rowley, adding that he had help from the other two.

2 William Borne or Bird engaged to play with the Admiral's Men for three years from 1597. In 1600 he borrowed 30s. from Henslowe to pay for a new play, "Judith," by W. Boyle (probably another name for himself). He helped S. Rowley in Joshua (1601), and in additions (1602) to Marlowe's "Dr Faustus." His connexion with the theatre ceased about 1621.
Edward Guinness (afterwards Lord Iveagh) with regard to the latter's projected gift of £200,000 for endowment of a trust for the improvement of the dwellings for the working classes, Rowton made himself personally familiar with the conditions of the poorest inhabitants of London; and he determined to establish "a poor man's hotel," which should offer better accommodation than the common lodging-houses, at similar prices. In the face of much discouragement and difficulty, the first Rowton House was opened at Vauxhall in December 1892, the cost (£39,000) being defrayed by Lord Rowton, though he was by no means a man of great wealth. In 1894 a company, Rowton Houses (Limited), was incorporated to extend the scheme, a main characteristic of which was that the houses should not be charitable institutions but should be on a paying commercial basis. The scheme proved a gratifying success, and was imitated not only in many of the chief towns of Great Britain, but also in different countries of Europe and in America (see Housing). Lord Rowton also devoted himself to the business of the Guinness Trust, of which he was a trustee, and was interested in many philanthropic schemes. Lord Rowton was unmarried, and the title consequently became extinct at his death, which occurred in London on the 9th of November 1903.

ROXANA, or Roxane, daughter of the Bactrian king Oxyartes, and wife of Alexander the Great. After the latter's death she gave birth to a son (Alexander IV.), who was accepted by the generals as joint-king with Arrhidaeus. Having crossed over to Macedonia, and thrown in her lot with Olympias, mother of Alexander the Great, she was imprisoned by Cassander in the fortress of Amphipolis and put to death (310 or 309 B.C.). The marriage of Alexander and Roxana was the subject of a famous painting by Aïtton.

See Plutarch, Alexander, 47, 77; Arrian, Anab. iv. 18, vii. 27; Diod. Sic. xviii. 3, 9, xii. 22, 105; Strabo xi. p. 517, xvi.

P. 794.

ROXBURGH, EARLS AND DUKES OF. ROBERT KER, 1st earl of Roxburgh (c. 1570–1650), was the eldest son of William Ker of Cessford (d. 1606) and the grandson of Sir Walter Ker (c. 1584), who fought against Mary Queen of Scots both at Carberry Hill and at Langside. He was descended from Sir Andrew Ker of Cessford (d. 1526) who fought at Flodden and was killed near Melrose in January 1526 by the Scots of Buccleuch. The deed was avenged when the Kers under Sir Walter killed Sir Walter Scott of Buccleuch in Edinburgh in 1552. Robert Ker was also descended, on the maternal side, from Andrew Ker of Ferniehurst (c. 1471–1533), a celebrated border chieftain. Another famous member of the family was Andrew's grandson, Sir Thomas Ker of Ferniehurst (d. 1580), who, Camden says, was "of an immovable fidelity to the queen of Scots and the king her son." He was the father of Robert Carr, earl of Somerset, the favourite of James I. After a turbulent life on the border Robert Ker became a Scottish privy councillor in 1599 and was made Lord Roxburghe about the same time; he accompanied King James to London in 1603, and was created earl of Roxburgh in 1616. He was lord privy seal for Scotland from 1637 to 1649, and in the Scottish parliament he showed his sympathy with Charles I.; but he took no part in the Civil War, although he signed the "engagement" for the king's release in 1648. He died at Floors, his residence near Kelso, on the 18th of January 1650. His son, Lord Ker, died in January 1653; consequently his titles and estates passed by special arrangement to his grandson, WILLIAM DRUMMOND (d. 1675), the youngest son of his daughter Jean and her husband John Drummond, and earl of Carnwath. William took the name of Ker, became 2nd earl of Roxburgh, and married his cousin Lord Ker's daughter Jean.

The second earl's son was ROBERT, 3rd earl (c. 1658–1682), whose son was JOHN, 1st duke of Roxburghe (c. 1680–1741). John became 5th earl on the death of his brother Robert, the 4th earl, in 1666, and is described by George Lockhart of Carnwath as "perhaps the best accomplished young man of quality in Europe." In 1704 he was made a secretary of state of Scotland, and he helped to bring about the union with England, being created duke of Roxburghe in 1709 for his services in this connexion. This was the last creation in the Scottish peerage. The duke was a representative peer for Scotland in four parliaments; George I. made him a privy councillor and keeper of the privy seal of Scotland, and he was loyal to the king during the Jacobite rising in 1715. He was again a secretary of state from 1716 to 1725, but he opposed the malt-tax, and in 1725 Sir Robert Walpole procured his dismissal from office. He died on the 24th of February 1741. His only son, ROBERT (c. 1709–1755), who had been created Earl Ker of Wakefield in 1722, became 2nd duke, and was succeeded by his son JOHN, 3rd duke of Roxburghe (1740–1804), the famous bibliophile. John was betrothed to Christiana, daughter of the duke of Mecklenburg-Strelitz; but when the princess's sister Charlotte was allied to George III., reasons of state led to the rupture of the engagement, and he died unmarried on the 10th of March 1804. The duke's library, including a unique collection of books from Caxton's press, and three rare volumes of broadside ballads, was sold in 1812, when the Roxburghe Club was founded to commemorate the sale of Valdarfer's edition of Boccaccio. Roxburghe's cousin William, 7th Lord Bellenden (c. 1728–1805), who succeeded to the Scottish titles and estates, died childless in October 1805, and for seven years the titles were dormant. Then in 1812 SIR JAMES INNES, bart. (1736–1823), a descendant of the 1st earl, established his claim to them, and taking the name of Innes-Ker, became 5th duke of Roxburghe. Among the unsuccessful claimants to the Roxburghe dukedom was John Bellenden Ker (c. 1765–1842), famous as a wit and botanist and the author of Archaeology of Popular Phrases and Nursery Rhymes (1837), whose son was the legal reformer, Charles Henry Bellenden Ker (c. 1785–1872).

The 5th duke's great-grandson, HENRY JOHN INNES-KER (b. 1876), became 6th duke in 1892. The duke of Roxburghe sits in the House of Lords as Earl Innes, a peerage of the United Kingdom, which was conferred in 1837 upon James Henry, the 6th duke (1816–1879).

ROXBURGHSHIRE, a Border county of Scotland, bounded w. by Berwickshire, E. and S.E. by Northumberland, S. by Cumberland, S.W. by Dumfriesshire and N.W. by the shires of Selkirk and Mid Lothian. It has an area of 426,000 acres, or 665.7 sq. m. The only low-lying ground in the shire is found in the N. and in the valleys of the larger rivers, and the soil is marked hilly. Though the Cheviots, forming for a considerable distance the natural boundary with England, mostly belong to Northumberland, Caxtonishale, Shin (1742 ft.) and Peel Fell (1604) are Scottish peaks. The chief heights of the mountainous mass constituting the watershed between Teviotdale and Liddesdale are Cauleddie Head (996), Greatmoor (1604), Pennygait (1805), Din Fell (1753), Windburgh (1622) and Arnton Fell (1643). In the W. is Crib Law (1369), and in the N., near Melrose, occur the triple Eildons (highest peak, 1385). The county is abundantly watered. The Tweed flows through the N. of the shire for 26 out of its total run of 97 m., though for about 2 m. (near Abbotsford) it is the boundary stream with Selkirkshire, and for 10 m. lower down with Berwickshire (parishes of Earlston and Merton). On the right its affluents are the Bowden and the Teviot, and on the left the Allan and the Eden. The Teviot is the principal river lying entirely in Roxburgshire. From its source near Causeway Grains Head on the Dumfriesshire border, it follows mainly a N.E. direction for 37 m. to its confluence with the Tweed at Kelso. Its chief tributaries are, on the right, Allan Water, the Tweed Burn, the Oxsand and the Kale, and, on the left, Borthwick Water and the Ale, both rising in Selkirkshire. The Liddel is the leading stream in the S. Rising near Peel Fell in the Cheviots it flows S.W. to the Esk after a course of 27 m., receiving on the right Hermitage Water, on the left Kershope Burn. The Kershope and Liddel, during part of their run, serve as boundaries with Cumberland. Excepting the Liddel, which drains to the Esk, much the greater portion of the surface is drained, by the Tweed, to the North Sea. The lakes are few
and small, the largest being Yetholm or Prinside Loch and Horselaw, both in the parish of Linton among outlying hills of the county. Liddesdale, Jedd开发区, and Jedvalle are the principal valleys.

Geology.—This county contains a considerable range of sedimentary rocks from the Ordovician to the Carboniferous systems, and with these are associated large tracts of volcanic rocks. The Ordovician and Silurian rocks occupy the N.W. part of the county; the latter are thrown into numerous sharp folds. It is of the crests of the antehill that the former system appear flanked on either side by those of the latter. The oldest rocks are the mudstones and radiolarian cherts with contemporaneous and intrusive igneous rocks of Arenig age; these are followed by shales and greywackes of Llandovery age and similar rocks of Cardac age. Then comes the Silurian with the Birkhill shales and massive grits and greywackes of the Gala or Queenberry group with the Hawick rocks; these are all of Llandovery age and occupy the greater part of the Silurian area. Wenlock and Ludlow rocks are found S. of Hawick rocks from Wisp Hill N.E. by Stobs Castle; other inlying masses occur in the Old Red Sandstone and Carboniferous areas, the largest of these being that which appears in a belt some 15 m. from near Riccarton in the direction of Hohkirk. Two divisions of the Old Red Sandstone occur; the lower, which consists of subordinate sandstones and conglomerates in sheets of contemporaneous laves with some tuffs, is confined to the Cheviots; the strata are unconfidential by shales and greywackes of the Lower Old Red Sandstone; which in its turn is unconformable upon the lower, occupies about one-third of the county. It consists of coarse conglomerates at the base followed by sandstones and marls. It is well developed in the valley of the Tweed, rocks of a similar nature are found at Makerstown which cross the Tweed are due to these lavas. It extends from Newtown and Kelso to Kirkton with extensions in the valleys S.W. Carboniferous rocks are represented by the Coal Measures and Downton Rocks. Coal is common in the coalfield and on the uplands of Carter Fell, Lariston Fell, etc., they are sandstones with shales, some calcareous beds and coal and volcanic beds. In the N.E. corner of the county the outer part of the Berwickshire Caradoc rocks occur. Carboniferous rocks are contemporaneous and eating series of volcanic "necks" belonging to this period is exemplified in Dunain Law, Black Law, Maiden Paps, Ruberslaw and other hills. Glacial deposits are represented by boulder clay and boulders and ridges of sand and gravel.

Climate.—The average annual rainfall is about 37 in., higher in the hilly regions and somewhat lower towards the N. and E. The mean temperature for the year is 48° F., for January 38° F. and for July 60° F. The soil is chiefly loam in the level tracts along the banks of the larger streams, where it is also very fertile. In other districts a mixture of clay and gravel is mostly found, but there is besides a considerable extent of mossy land. Of the area under grain about two-thirds are occupied by oats, the remainder being devoted to potatoes, turnips, and swedes. Turnips and swedes are most generally cultivated, potatoes covering a comparatively small acreage. In different parts of Tweedside and Jedvalle several kinds of fruit are successfully grown. Both in the pasture and arable localities agriculture is in an advanced condition. The sheep are principally in two classes, there is a fine woolen and so-called mohair sheep, which occupies the walks in increasing large quantities. The herds of cattle are also heavy, horses are kept mostly for farming operations, and pigs are raised in modern hogs, and work generally. The large holdings now occupied by forest, the acreage under wood is now relatively small.

The county is the principal seat of the tweed and hosiery manufactures in Scotland. Engineering, iron founding, dyeing and tanning are also important. In Jedburgh and Kelso are the seat of the county and there are large implement factories, chemical manufactures and especially fishery tackle are made at Kelso. The salmon fisheries on the Tweed are of considerable value.

The Waverley line of the North British railway runs through the county. The line from near Melrose in the N. to Kershopefoot in the S. At St Boswells branches are sent off to Duns and Reston, and to Jedburgh and Kelso via Roxburgh. The North-Eastern Railway Company, an English company, has a line from Berwick to Kelso, via Coldstream and Carham.

Population and Administration.—The population in 1901 was 48,804, or 78 persons to the sq. m. In 1901 there were 132 persons who spoke Gaelic and English, but none Gaelic only. The principal towns are Hawick (pop. 17,303), Kelso (4008), Jedburgh (3126). The county returns a member to parliament, and Hawick belongs to the larger group of parliamentary burgs. Jedburgh, the county town, is a royal burgh, and Hawick, Kelso and Melrose are police burghs. The shires of Roxburgh, Berwick and Selkirk form a sheriffdom, and a resident sheriff-substitute sits at Jedburgh and Hawick. The county is under school-board jurisdiction, and there are secondary schools at Hawick and Kelso, while the board schools at Jedburgh and Melrose have secondary departments. Most of the "Cultural" grant is expended in assisting teachers to attend science and art classes at Edinburgh University and Hawick, and in subsidizing science and art and technical classes at Hawick, Kelso and elsewhere.

History and Antiquities.—Among the more important remains of the original inhabitants are the so-called "Druidical" stones and circles at Plenderleath between the Kale and Oxnarn; on Hownam Steeple, a few miles to the N.W. (where they are locally known as the Shearers and the Bandster); and at Midshills on the Teviot. The stones on Ninestane Rig, near Hermitage Castle, and on Whisgliss are supposed to commemorate the Britons of Strathclyde who, under Aidan, were defeated with great slaughter by Ethelfrith, king of Bernicia, at the battle of Deganstane or Dawstane in 603. There are hill forts in Liddesdale on the Allan, in the parish of Oxnarn, and on the most easterly of the three Eildons. This last is said to be the largest example of its kind in Scotland. The fortress was defended by pallas threads around the three circular terraces which form the hill-top. Within the enclosure there was a town of huts, judging from certain marks that indicate the site of such dwellings, and the relics of early British pottery have been found, while the fact that springs exist renders the theory of a settlement all the more probable. One of the most important and most mysterious of British remains is the Catrall, or Picts' Work Dyke. In its original condition it is supposed to have consisted of a line of double mounds or ramparts, averaging about 30 ft. in width, with an intervening ditch 6 ft. broad, the slope from the centre of the mound to the middle of the bottom of the trench being 10 ft. Owing to weather and other causes, however, it is now far from perfect and in places has disappeared for miles. Beginning at Torwoodlee, N.W. of Galashilles, it ran S.W. to Yarrow church, whence it turned first S. and then E., following a meandering course to Peel Fell in the Cheviots, a distance of 48 miles. Though it must have been difficult to defend so long a line, the bulk of opinion is in favour of its being a defence work. Roman remains are also of exceptional interest. Watling Street crossed the Border N. of Brownhart Law (1664 ft.) in the Cheviots, then took a mainly N.W. direction across the Kale, Oxnarn, Jed and Teviot to Newstead, near Melrose, where it is conjectured to have crossed the Tweed and run up Lauderdale into Haddintshire. The chief stations were Ad Fines on the Cheviots, Gadanan (Bonjedward) near Jedfoot and Eildon Hill (? Trimontium). Another so-called Roman road is the Wheel Causeway or Causey, a supposed continuation of the Maiden Way which ran from Overburgh in Lancashire to Bewcastle in Cumberland, and so to the Border. It entered Roxburghshire N. of Deadwater and went (roughly) N. as far as Wolfcape, whence its direction becomes a matter of surmise. Of Roman camps the principal appear to have been situated at Cappuck, to the S.E. of Jedburgh, and near Newstead, at the base of the Eildons, the alleged site of Trimontium. After the retreat of the Romans the country was occupied by the Britons of Strathclyde in the W. and the Bernicians in the E. It was then annexed to Northumbria for over four centuries until it was ceded, along with Lothian, to Scotland in 1108. David I. constituted it a shire, its ancient county town of Roxburgh (see Kelso) forming one of the Court of Four Burghs. The castle of Roxburgh, after changing hands more than once, was captured from the Anglo-Saxons in 1460 and dismantled. Other towns were repeatedly burned down, and the abbeys of Dryburgh, Jedburgh, Kelso and Melrose ultimately ruined in the expedition of the earl of Hertford (the Protector Somerset) in 1544-45. The Border freebooters—of whom the Armstrongs and Elliot were the chief—conducted many a bloody fray on their own account. On the union of the crowns the county gradually settled into what was
ROXBURY—ROYAL SOCIETY

comparatively a state of repose, disturbed to some extent during the Covenanting troubles and, to a much slighter degree, by the Jacobite rebellions.

ROXBURY, formerly a city of Norfolk county, Massachusetts, U.S.A., situated between Boston and Dorchester, but since 1868 a part of Boston. It is primarily a residential district. Among its institutions are the Roxbury Latin School, established in 1645, the Fellows Athenaeum (a part of the Roxbury branch of the Boston Public Library), with about 26,000 volumes in 1909, and the New England Hospital for Women and Children (1863), the New England Baptist Hospital (1853), the Woman's Charity Club Hospital (1890), the Roxbury Homoeopathic Dispensary (1886), the Roxbury Home for Children and Aged Women (1856), a Home for Aged Couples (1847) and the Massachusetts Home for Intemperate Women (1879). On Mount Bellevue, in West Roxbury (set apart from Roxbury in 1857 and annexed to Boston in 1873), there is an observatory (erected in 1869 by the city of Boston as a standpipe for the high service water supply). Among the manufactures of the district are cotton and woolen goods, cordage, carpets, shoes and foundry products. The town of Roxbury (at first usually spelled Rocksbury) was founded in 1630 by some of the Puritan immigrants who came with Governor John Winthrop; the settlers were led by William Pynchon, who in 1636 led a party from here and founded Springfield, Mass. At the home of Rev Thomas Welde (d. 1662), the first minister, Anne Hutchinson (q.v.) was held in custody during the winter of 1637–38. Associated as teacher with Welde and his successors, Samuel Danforth and Nehemiah Walter, was John Eliot, the apostle to the Indians, who removed to Roxbury in 1659 and died here in 1660. Roxbury was the home also of Thomas Dudley, of his son Joseph and of his grandson Paul; of Robert Calef (d. 1710), the leader of the opposition to the witchcraft craze; of General Joseph Warren, and of William Eustis (1753–1825), who was U.S. secretary of war (1809–12), minister to the Netherlands (1814–18), and governor of Massachusetts (1823–25); and from 1837 to 1845 Theodore Parker was the pastor of the Unitarian Church of West Roxbury. Of special interest in the old Roxbury burial-ground is the “Ministers' Tomb,” containing the remains of John Eliot, and the tomb of the Dudleys. West Roxbury was the scene of the Brook Farm experiment (see Brook Farm). Roxbury was chartered as a city in 1836.

See F. S. Drake, The Town of Roxbury, its Memorable Persons and Places (Boston, 1878 and 1905).

ROY, WILLIAM (1756–1790), a famous British surveyor, military draughtsman, antiquary, &c. In 1746, when an assistant to Colonel Watson, deputy quartermaster-general in North Britain, he began the survey of the mainland of Scotland, the results of which were embodied in what is known as the “dike of Cumberland’s map.” In 1755 he obtained his commission in the 4th King’s Own Foot, and in 1759 gained his lieutenantcy and went to serve in Germany in the Seven Years’ War. In 1765 he appears as deputy quartermaster-general to the forces, surveyor-general of coasts and engineer-director of military surveys in Great Britain; in 1767 he became F.R.S., in 1781 major-general, in 1783 director of Royal Engineers. Besides his campaigns and observations in Germany, his visits to Ireland (1766) and to Gibraltar (1768) were important. In 1783–84 he conducted observations for determining the relative positions of the French and English royal observatories. His measurement of a base-line for that purpose on Hounslow Heath in 1784, the germ of all subsequent surveys of the United Kingdom, gained him in 1785 the Copley medal of the Royal Society. Roy’s measurements (not fully utilized till 1787, when the Paris and Greenwich observatories were properly connected) formed the basis of the topographical survey of Middlesex, Surrey, Kent and Sussex. He was finishing an account of this work for the Phil. Trans. when he died on the 1st of July 1790.

ROYAL FERN, in botany, the common name for the fern Osmunda regalis, a native of Britain, where it grows in bogs, marshy woods, &c. It is a handsome plant with bi-pinnate fronds 2 to 6 ft. long and 1 ft. or more broad; the tops of the fronds are fertile, the fertile pinnae being cylindrical and densely covered with the spore-cases, giving the appearance of a dense panicle of flowers, whence the plant is known as the flowering fern. There are various cultivated forms—crisata has the ends of the fronds and the pinnae finely crested, and corymbifera has curiously forked and created fronds. Other species, such as O. cinnamomea, O. Claytoniana, are known as handsome greenhouse ferns (see also Ferns).

ROYAL SOCIETY, THE, the oldest scientific society in Great Britain, and one of the oldest in Europe. The Royal Society (more fully, The Royal Society of London for Improving Natural Knowledge) is usually considered to have been founded in the year 1660, but a nucleus had in fact been in existence for some years before that date. As early as the year 1645 weekly meetings were held in London of “divers worthy persons, inquisitive into natural philosophy and other parts of human learning, and particularly of what hath been called the New Philosophy or Experimental Philosophy,” and there can be little doubt that this gathering of philosophers is identical with the little “Invisible College” of which Boyle speaks in sundry letters written in 1646 and 1647. These weekly meetings, according to Wallis, were first suggested by Theodore Haak, “a German of the Palatinate then resident in London,” and they were held sometimes in Dr Goddard’s lodgings in Wood Street, sometimes at the Bull-Head Tavern in Cheapside.

Some of these “Philosophers,” resident in Oxford about 1648, formed an association there under the title of the Philosophical Society of Oxford, and used to meet, most usually in the rooms of Dr Wilkins, warden of Wadham College. A close intercommunication was maintained between the Oxford and London Philosophers; but ultimately the activity of the society was concentrated in the London meetings, which were held principally at Gresham College.

On November 28, 1660, the first journal book of the society was opened with a “memorandum,” from which the following is an extract: “Memorandum that Novemb. 28. 1660. These persons following, according to the usual custom of most of them, met together at Gresham Colledge to heare Mr Wren’s lecture, viz. The Lord Brouncker, Mr Boyle, Mr Bruce, Sir Robert Moray, Sir Paul Neile, Dr Wilkins, Dr Goddard, Dr Petty, Mr Ball, Mr Rooke, Mr Wren, Mr Hill. And after the lecture was ended, they did, according to the usual manner, withdrawe for mutual converse. Where amongst other matters that were discoursed of, something was offered about a designe of founding a Colledge for the promoting of Physico-Mathematicall Experimental Learning.” It was agreed at this meeting that the company should continue to assemble on Wednesdays at three o’clock; an admission fee of ten shillings with a subscription of one shilling a week was instituted; Dr Wilkins was appointed chairman; and a list of forty-one persons judged likely and fit to join the design was drawn up. On the following Wednesday Sir Robert Moray brought word that the king (Charles II.) approved the design of the meetings; a form of obligation was framed, and was signed by all the persons enumerated in the memorandum of the 28th of November and by seventy-three others. On the 12th of December another meeting was held at
time of the meetings was principally occupied by the performance and discussion of experiments. The society early exercised the power granted by charter to appoint two "curators of experiments," the first holder of that office being Robert Hooke, who was afterwards elected a secretary of the society.

Another matter to which the society gave attention was the formation of a museum, the nucleus being "the collection of rarities formerly belonging to Mr. Hubbard," which, by a resolution of council passed on the 21st of February 1666, was purchased for the sum of £100. This museum, at one time the most famous in London, was presented to the trustees of the British Museum in 1751, upon the removal of the society to Somerset House. A certain number, however, of instruments and models of historical interest have remained in the possession of the society, and some of them, more peculiarly associated with its earlier years, are still preserved at Burlington House. The remainder have been deposited in the Victoria and Albert Museum, South Kensington.

After the Great Fire of London in September 1666 the apartments of the Royal Society in Gresham College were required for the use of the city authorities, and the society were therefore invited by Henry Howard of Norfolk to meet in the power granted by charter to appoint two "curators of experiments," the first holder of that office being Robert Hooke, who was afterwards elected a secretary of the society.

large number of societies now active in the promotion of special branches of science.

From the time of its royal founder onwards the Royal Society has consistently contributed to the government for advice in connexion with scientific undertakings of national importance. The following are some of the principal matters of this character upon which the society has been consulted by, or which it has successfully urged the government to take action, of the history of the observations and equipment of the Royal Observatory, Greenwich, in 1710, when it was placed in the sole charge of the society; the change of the calendar in 1752; ventilation of prisons; protection of buildings and of the equipment of the Royal Observatory; the measurement of the length of a pendulum vibrating seconds; comparison of the British and French standards of length; the Geodetic Survey in 1784, and the General Triangulometric Survey begun in 1791; expeditions to observe the transits of Venus in 1761, 1769, and 1874; the contribution of the British government for the expeditions of 1772 (under Captain Cook, whose voyage extended to the circumnavigation of the globe), of 1839 (under Ross), and 1900; observations for determining the density of the earth; Arctic expeditions of 1817 (in search of the North-West Passage), 1819 and 1823 (under Parry), of 1827 (Parry and Ross), of 1845 (Franklin), of 1874 (under Nares); numerous expeditions for observing eclipses of the sun; 1822, use of coal-tar in vessels of war; better manner of measuring tomatoes; the invention of, the economy of, and equipment for, sea-water; Babage's calculating machine; lightening-conductors for vessels of war; 1825, supervision of gas-works; 1832, tidal observations; 1835, instruments and tables for testing the strength of spirits; magnetic observatories in various countries; 1869, the great Bell Telephone Company; 1869-72, pendulum observations in 1866, reorganization of the meteorological department; 1868, deep-sea research; 1872, "Challenger" expedition; 1879, prevention of accidents in mines; 1881, pendulum observations; cruise of the Challenger; 1883, the establishment of the International Bureau des Poids et Mesures; international conference on a prime meridian; 1888, inquiry into lighthouse illuminants; 1890, the investigation of colour-blindness; 1895, examination of the structure of the causes of important discoveries have been made; in relation to various tropical diseases, beginning with the tsetse-fly disease of cattle in Africa, followed by investigations into malaria, Mediterranean fever and sleeping sickness. The society has standing committees which aim at obtaining a better knowledge of the government, and inquiry in India and on the observatories in India. The society has taken a leading part in the promotion of the International Catalogue of Scientific Literature from 1860, and of the International Association of Scientific Correspondents, which annually publishes the serials of the scientific academies of the world, meeting regularly to promote international action in questions of scientific interest.

In addition to the occasional services enumerated above, the Royal Society has, at times, exercised, and still exercises, a variety of important public functions of a more permanent nature. It still provides several of the board of visitors of the Royal Observatory at Greenwich. From 1877 until the reorganization of the Meteorological Office in 1906 the society nominated the meteorological council, which had the control of that office. The society has the custody of standard copies of the imperial standard yard and pound. The president and council have the control of the National Physical Laboratory, an institution established in 1899 in pursuance of the recommendations of the report of the Royal Commission on weights and measures, and the government in response to representations from the Royal Society. The society had previously for many years had control of the Kew Observatory, now incorporated with the National Physical Laboratory. The Royal Astronomical Society was established for the maintenance of the observatory. The society elects four of the nine members of the managing committee of the Lawes Agricultural Trust, and is officially represented on the governing boards of scientific and educational institutions and of the principal public schools.

One of the most important duties which the Royal Society performs on behalf of the government is the administration of the annual grant of £4000 for the promotion of scientific research. This was established by a charter in 1754. The society's report to the government in 1881 on the results of the award of the grant for the year 1879, which was £1000, was the first report under the new charter. The grant was increased to £2000 for the years 1883 to 1887, and to £4000 for the year 1888. The grant has been increased from time to time, and is now £10000.

The Royal Society has been the recipient of a number of special grants from the government, the last being £10000 in 1881, in which year the two were combined in a single annual grant of £4000 under new regulations. Since 1896 the society has also voted annually a grant of £1000 to be administered by the Royal Society in aid of scientific publications, not only those issued by the society itself, but also by other learned or scientific associations. One of the most useful of the society's publications is the great catalogue of scientific papers—an index now in twelve volumes, under authors' names, of all the memoirs of importance in the chief English and foreign scientific serials from the year 1800 to the present. The catalogue is issued by the authority of the Council of the Royal Society. A continuation carrying the catalogue up to the end of the 19th century, and a subject index to the whole catalogue, have also been compiled.

The management of the trust funds administered by the Royal Society will be found in the Year Book published annually, and the origin and history of these funds will be found in the Record of the Royal Society (2nd ed. 1901). The income of the society is derived from three sources: a grant from the government, which has been derived from the sale of patents and from interest on various investments. The balance-sheet and an account of the estates and property are published in the Year Book. Five medals (the Copley, two Royal, the Davy and the Darwin medals) are awarded by the society every year; the Copley and the Darwin medals biennially, the Sylvester triennially and the Buchanan quinquennially. The first of these originated in a bequest by Sir Godfrey Copley (1709), and is awarded to "the living author of a philosophical research, either published or communicated to the society, or any paper or Institution to be deserving of that honour"; the author may be an Englishman or a foreigner. The Rumford medal originated in a gift from Count Rumford in 1796 of £1000 3%, for the most important contributions to science in America. The Copley medal is awarded annually for the best discovery or invention published in the British dominions not more than ten years nor less than one year before the date at which the award was made.

The Royal medals were instituted by George IV., and are awarded annually for the two most important contributions to science published in the British dominions not more than ten years nor less than one year before the date at which the award was made.

The Society also has the award of three research studentships, one founded in 1890 in memory of J. P. Joule, and the others created out of a bequest to the society by Sir William Crookes.

Under the existing statutes of the Royal Society every candidate for election into the society must be recommended by a certificate in writing signed by six or more Fellows, of whom three at least must sign from personal knowledge. From the candidates so recommended a ballot is held, and those elected are made Fellows of the society. The names of those elected are published in the Year Book, and the numbers elected in any one year do not exceed fourteen or fifteen. The election of Fellows is determined by the council, and the names so elected are submitted to the society for election by ballot. The election of Fellows is determined by the council, and the names so elected are submitted to the society for election by ballot. The election of Fellows is determined by the council, and the names so elected are submitted to the society for election by ballot.
ROYALTY

ROYALTY—ROYLE

ROYALTY (O. Fr. reelte, reelte, royaute, from Med. Lat. regalitas, the substantive of regalis, or of belonging to a king, rea), kingly state or personality, hence a royal person, or number of persons of royal birth collectively, a member of a royal family. More particularly “royalty” is used of the rights and attributes of a sovereign, and especially of dues paid to the crown, which belong to the sovereign jure corone, such as dues from gold and silver mines, waifs, estrays, &c. The term is usually applied to the payment made by a publisher to an author on every copy of his book sold; to the payment made to a patentee on each article manufactured under his patent by a licensee (see PATENTS), and to the payment made to the owner of minerals for the right of working, paid on the ton or other weight raised.

ROYAN, a town of W. France, in the department of Charente Inférieure, on the right bank of the Gironde, at its mouth 63 m. below and N.N.W. of Bordeaux. Pop. (1906) 7142. Royan is one of the most frequented bathing resorts on the Atlantic seaboard. The coast is divided into a number of small bays or “conches,” forming so many distinct beaches: to the E. of the town is the “Grande Conche” with the municipal casino; to the S. the “Conche de Fonceillon,” separated from the first-named by a quay which forms a fine terrace esplanade; beyond the fort of Royan follow in succession the conches “du Chay” and “de Robinçon,” and the most fashionable of all, that of Pontaillac. The port carries on sardine-fishing and an active coasting trade, but the harbour at high tide is accessible only to vessels drawing from 8 to 10 ft., and at low water is dry. Eugène Pelletan, the author, has a statue in the town, of which he was a benefactor. The lighthouse of Cordouan, 300 ft. in height, rebuilt on the site of an older tower by the architect Louis de Foix in 1584-1610 and added to about the end of the 18th century, stands on a rock 71 m. W.S.W. of Royan.

Royan after passing through many hands came to the family of la Trémolère, in whose favour it was made first a marquisate and then a duchy. During the first half of the 15th century it was held by the English. During the wars of religion it was a centre of Calvinism and had to sustain in 1562 an eight days’ siege by the troops of Louis XIII. As late as the end of the 18th century it was but a “bourg” of about one thousand inhabitants, noticeable only for its priory, where Brantôme wrote a portion of his Chronicles. The prosperity of the place dates from the Restoration, when steamboat communication was established with Bordeaux.

ROYAT, a watering-place in central France, in the department of Puy-de-Dôme, situated at a height of 1475 ft. on the Tarnaise, 13 m. S.W. of Clermont-Ferrand. Pop. (1906) 1451. The thermal springs, situated in the part of Royat known as St Mart, are strongly impregnated with carbonic acid and chloride of sodium and are used in cases of rheumatism, gout, bronchitis, asthma, anaemia, &c. They were known in Roman times, and ruins of ancient baths are still to be seen. The village of Royat proper, a little higher up the valley, has a church of the 11th and 12th centuries fortified with battlements.

ROYER-COLLARD, PIERRE PAUL (1763–1835), French statesman and philosopher, was born on the 21st of June 1763 at Sompis, near Vitry le Français (Marne), the son of Antoine Royer, a small proprietor. His mother, Angélique Perpétue Collard, was a woman of unusual strength of character and of austere piety. Pierre Paul Royer was sent at twelve to the college of Chaumont of which his uncle, Father Paul Collard, was director. He subsequently followed his uncle to Saint-Omer, where he studied mathematics. At the outbreak of the Revolution, which moved him to passionate sympathy, he was practising at the Parisian bar. He was returned by his section, the Island of Saint Louis, to the Commune, of which he was secretary from 1790 to 1792. After the revolution of the 18th of August in that year he was replaced by J. L. Tallien. His sympathies were now with the Gironde, and after the insurrection of the 12th Prairial (13th of May 1793) he was in danger of his life. He returned to Sompis, and was saved from arrest possibly by the protection of Danton and in some degree by the impression made by his mother’s courageous piety on the local commissary of the Convention. In 1797 he was returned by his department (Marne) to the Council of the Five Hundred, where he allied himself especially with Camille Jordan. He made one great speech in the council in defence of the principles of religious liberty, but the coup d’état of Fructidor (4th of September 1797) drove him again into private life. It was at this period that he developed his legislative opinions and entered into communication with the Comité de Provence (Louis XVIII). He was the ruling spirit in the small committee formed in Paris to help forward a Restoration independent of the Comité d’Artois and his party; but with the establishment of the Consulate he saw the prospects of the monarchy were temporarily hopeless, and the members of the committee resigned. From that time until the Restoration Royer-Collard devoted himself exclusively to the study of philosophy. He derived his opposition to the philosophy of Condillac chiefly from the study of Descartes and his followers, and from his early veneration for the fathers of Port-Royal. He was occupied with the erection of a system which should provide a moral and political education consonant with his view of the needs of France. From 1811 to 1814 he lectured at the Sorbonne. From this time dates his long association with Guizot. Royer-Collard himself was supervisor of the press under the first restoration. From 1815 onwards he sat as deputy for Marne in the chamber. As president of the commission of public instruction from 1815 to 1820 he checked the pretensions of the clerical party, the immediate cause of his retirement being an attempt to infringe the rights of the university of Paris by giving university diplomas, independent of university examinations, to the teaching fraternity of the Christian Brothers. Royer-Collard’s acceptance of the Legitimist principle did not prevent a faithful adhesion to the social revolution effected in 1789, and he protested in 1815, in 1820, and again under the monarchy of July against laws of exception.

He was the moving spirit of the “Doctrinaires,” as they were called, who met at the house of the comte de Ste Aulaire and in the salon of Madame de Staff’s daughter, the duchesse de Broglie. The leaders of the party, beside Royer-Collard, were Guizot, P. F. H. de Serre, Camille Jordan and Charles de Rémusat. In 1820 he was excluded from the council of state by a decree signed by his former ally Serre. In 1827 he was elected for seven constituencies, but remained faithful to his native department. Next year he became a member of the chamber, and fought against the reactionary policy which precipitated the Revolution of July. It was Royer-Collard who in March 1830 presented the address of the 221. From that time he took no active part in politics, although he retained his seat in the chamber until 1836. He died at his estate of Châteauvieux, near Vitry, on the 2nd of September 1845. He had been a member of the council since 1827. Royer-Collard married in 1799 Mlle. deForges de Châteauvieux. The two daughters who survived to womanhood received an education of the utmost austerity.

Royer-Collard left no considerable writings, but fragments of his works and of the works of his nephew have been included in the works of Thomas Reid. The standard life of Royer-Collard is by his friend Prosper de Barante, Vie politique de M. Royer Collard, ses discours et ses écrits (2 vols., 1861). There are also biographies by M. A. Philippe (1857), by L. Vingtaine (1858), by E. Spuller (1865), in Grands écrivains français. Cf. E. Faguet, Politique et morale du xixe siècle (1894); H. Taine, Les Philosophes français du xixe siècle (1857); L. Sèché, Les Derniers Jansénistes (1891); and J. M. Siegfried, Jules Michelet (1878). For further references see H. P. Thieme, Guide bibliographique (Paris, 1907).

ROYLE, JOHN FORBES (1799–1838), British botanist and teacher of materia medica, was born in Cawnpore in 1799. Entering the service of the East India Company as assistant surgeon, he devoted himself to studying botany and geology, and made large collections among the Himalaya Mountains. He also investigated the medical properties of the plants of

794
Hindustan and the history of their uses among the native races. The results of these investigations appeared in an essay On the Antiquity of Hindoo Medicine (1837). For nearly ten years he held the post of superintendent of the East India Company's botanical garden in the Himalayas at Saharanpur. In 1837 he was appointed to the professorship of materia medica in King's College, London, which he held till 1856. From 1838 onwards he conducted a special department of correspondence, relating to vegetable products, at the East India House, and at the time of his death he had just completed there an extensive and valuable museum of technical products from the East Indies. In 1851 he superintended the Indian department of the Great Exhibition. He died at Acton near London on the 2nd of January 1858.

The work on which his reputation chiefly rests is the Illustrations of the Soil and other branches of Natural History of the Himalaya Mountains, and of the Flora of Cashmere, in 2 vols. 4to, begun in 1839. In addition he wrote An Essay on the Productive Resources of India (1840), On the Culture and Commerce of Cotton in India and Elsewhere (1851) and The Fibrous Plants of India fitted for Cordage (1855), together with papers in scientific journals.

ROYSTON, a market town in the Hitchin parliamentary division of Hertfordshire, England, close to the border of Cambridgeshire, 48 m. N. of London by the Cambridge branch of the Great Northern railway. Pop. of urban district (1901) 3517. The church of St John the Baptist is mainly Early English. There are a market house, and institute with library and museum. Beneath a street in the town is a curious example of a hermit's cave, excavated in the chalk, and containing rude carvings of the crucifixion and other sacred subjects. It was discovered in 1742. The town lies on the Roman Ermine Street, at the point where it strikes from the hills across the plain, and its straight course is deflected slightly W. Roman relics have been found, and several barrows and earth-mounds occur on the neighbouring hills. A monastery of Augustinian canons was founded here towards the close of the 12th century, but these are no remaining.

ROYTON, an urban district of Lancashire, England, within the parliamentary borough of Oldham, 2 m. N. of Oldham on the Lancashire & Yorkshire railway. Though of early origin, it is, as a town, of wholly modern growth. The cotton manufacture is its chief industry. Pop. (1901) 14,851.

ROZAS, JUAN MARTINEZ DE (1759-1813), the earliest leader in the Chilean struggle for independence, was born at Mendoza in 1759. In early life he was a professor of law, and of theology and philosophy at Santiago. He held the post of acting governor of Concepcion at one time, and was also colonel in a militia regiment. In 1808 he became secretary to the last Spanish governor, Francisco Antonio Carrasco, and used his position to prepare the nationalist movement that began in 1809. After resigning his position as secretary, Rozas was mainly responsible for the resignation of the Spanish governor, and the formation of a national junta on the 18th of September 1810, of which he was the real leader. Under his influence many reforms were initiated, freedom of trade was established, an army was organized and a national congress was called together in July 1811. But at the end of that year divisions began to arise between Rozas' followers from Concepcion and the men of Santiago; and a feud broke out between Rozas and José Miguel Carrera (q.v.) who had secured control of Santiago. In 1812 Carrera succeeded in securing the banishment of his rival, who retired to Mendoza, where he died on the 3rd of March 1813.

See P. B. Figueroa, Diccionario biográfico de Chile, 1550-1887 (Santiago, 1888), and J. B. Suarez, Raigues biográfics de homes notables de Chile (Valparaíso, 1880); both giving biographical sketches of prominent characters in Chilean history.

RUABON (Rhydabon), a town of Denbighshire, N. Wales, in the E. parliamentary division, near the Shropshire border, 5 m. S.W. of Wrexham, on the Great Western railway. Pop. (1901) 3248. It is situated on a small tributary of the Dee. The old Gothic church is thought by some to have been founded by Mahon, a brother of Llewelyn (12th c.), and has monuments to the Wyn family, by Nollekens and Rhysbrac, and to Dr D. Powell (d. 1508), translator of English of Caradoc's (of Llanearfan) History of Wales. In the neighbourhood are collieries, engineering works, an iron founder and chemical works, besides an extensive industry in glazed and other bricks. Near Ruabon is Caerddin (Caerddin), an ancient camp (village) surrounded by circular intrenchments, and Wynnstay, with an avenue of fine trees. Anciendly the residence of Madoc ab Gruffyd Maelor (founder of Valle Crucis Abbey), it was called Wattyst, from Watt's Dyke, an old rampart on the estate. It was named Wynnstay on its coming into possession of the Wynns (17th c.). Offa's Dyke, near here, is 10 ft. high, and broad enough for two carriages abreast. Not far is Chirk Castle (supposed to have been built in 1015), besieged by Cromwell's artillery: near it, in the Cerigol valley, the defeat of Henry II. by Owen Gwynned took place in 1165.

RUBBER, INDIARUBBER or CAOUTCHOUC (a word probably derived from Cohaucha or Como the names in Ecuador and Peru respectively for rubber or the tree producing it), the chief constituent of the coagulated milky juice or latex furnished by a number of different trees, shrubs and vines. The latex of the best rubber plants furnishes from 20 to 50% of rubber. The latex is not to be confused with the sap of trees, on the circulation of which their nutrition depends. Though frequently occurring, it is not a universal feature of plant life, and does not appear to be necessary or even directly connected with the nutritive system of plants. Its exact function is not fully understood. Latex, though chiefly secreted in vessels or small sacs which reside in the cortical tissue between the outer bark and the wood is also found in the leaves and sometimes in the roots or bulbs. The trees and plants whose latices furnish caoutchouc in considerable quantity chiefly belong to the natural orders Euphorbiaceae, Urticaceae, Apocynaceae, Asclepiadaceae. The latex is usually obtained from the bark or stem by making an incision reaching almost to the wood when the milky fluid flows more or less readily from the laticiferous vessels. It is, like milk, an emulsion, and when examined with the microscope is seen to consist of numerous globules suspended in a watery fluid. On standing, some latices separate, more or less readily, into an upper layer resembling cream and consisting of the globules, and a lower watery layer. This separation can be rapidly effected with some latices by the use of a centrifugal match, but this method has not yet been applied to any extent commercially. The globules which furnish the cream gradually pass on standing into solid caoutchouc, a process which is facilitated by rapid stirring, or by the addition of an acid or other chemical agent. If the latex is warmed or an acid, an alkali or astringent plant juice is added to it, "coagulation" usually takes place more or less readily; the caoutchouc separating in solid flakes or curds. The efficacy of heat or of an acid, an alkali or other agent in promoting coagulation depends on the character of the latex, and varies with that obtained from different plants. The watery fluid in which the globules are suspended holds certain proteins, carbohydrates and a small proportion of salts in solution. The latex exhibits a neutral, acid or alkaline reaction depending upon the plant from which it has been obtained. When exposed to air the latex gradually undergoes putrefactive changes accompanied by coagulation of the caoutchouc. The addition of a small quantity of ammonia or of formalin to some latices usually has the effect of preserving them for a considerable time. The nature of the coagulation is not yet completely understood. It has been compared with that of milk and of blood, which depend essentially on the coagulation or separation in curds of a proteid or albuminous substance, such as takes place when white of egg is warmed. There is, however, reason to believe that the coagulation of the latex into rubber is not mainly of this character. The globules in the latex are liquid, and the phenomenon of coagulation would seem to consist in the passage of this liquid into solid caoutchouc through the kind of change known as polymerization or condensation, in which a liquid passes into solid without alteration.
of composition or by condensation with the elimination of the elements of water. The effect of chemical agents in producing coagulation are in consonance with what is known of other instances of polymeric or condensation changes, whilst the fact that the collection of globules separated by creaming after thorough washing, and therefore removal of all proteid, is susceptible of solidification into caoutchouc by a merely mechanical act such as churning, strongly supports the view that the character of the change is distinct from that of any alteration which may occur in the proteid constituents of the latex.

The existence of caoutchouc or rubber was first observed soon after the discovery of America. It was noticed that certain Indian tribes of South America played with a ball composed of a resilient and elastic substance, which afterwards was found to possess the power of removing lead pencil marks from paper and came into commerce as "Indian Rubber." It was not until the middle of the 18th century that the trees which yielded caoutchouc were identified, chiefly by French observers. La Condamine ascertained the nature of the tree, now known to the locality. The forests of town a Hevea brasiliensis, from which the Para rubber of S. America was obtained, whilst a little later Fresnau and Aublet described the Euphorbiaceous trees which furnished the rubber of Guiana.

The methods adopted by the natives in S. America and in Mexico for incising the trees and obtaining the rubber are exceedingly primitive, but survive with little modification at the present day.

Statistics of Rubber Production.—Until recently rubber was obtained almost exclusively from the tropical forests of S. and Central America, E. and W. Africa and Asia, being the produce of naturally occurring trees and vines. The increase in the demand, for which the employment of rubber tires is largely responsible, has given an increased stimulus to the production of "wild" rubber, with the result that trees and vines have been recklessly cut and destroyed, and in some instances vast regions, as in the S. Sudan, have been nearly entirely denuded of rubber vines. This has led to restrictive measures, the vines being tapped under definite regulations as to the manner and time of tapping, and also to requirements as to replanting vines to take the place of those which have been injured or destroyed, certain areas being periodically closed. Such measures, which are now in operation in the French Sudan, the Congo and in German W. and E. Africa, can, however, only be enforced by special administrative machinery and at considerable expense, and this legislative action can only be regarded as temporary and preliminary to the establishment of plantations of rubber trees, which are not only easier to control, but the trees are less liable to injury from careless tapping. In Africa it seems probable that the production of rubber from vines is likely to be entirely superseded in process of time, and replaced by the plantations of trees which are already being established in those districts in which careful experiment has determined the kind of rubber tree best adapted to the locality. The forests of tropical America and Africa suffered similarly, trees having been injured or destroyed and in some cases cut down in order to secure the immediate increase of supply which was called for by a considerable rise in value. The result has been that in the forests of Brazil and Mexico the conservation of rubber trees has received greater attention, whilst new and extensive areas are planted in S. and Central America. The wild rubber of S. and Central America is still the principal source of the rubber supply of the world, and is likely to continue to be so for many years to come. Although the cost of transport from the remote forest regions of some districts is a serious consideration, this is not likely to be operative in reducing production until there has been a considerable and permanent fall in price, by which time new areas in those countries in which planting is now taking place will probably have come into bearing.

The enormous increase in the commercial demand for rubber and the probability of the continuance of this increase in view of the great variety of purposes to which the material can be applied, has led to great activity in rubber planting in other parts of the world, especially in Ceylon and the Malay Peninsula and Archipelago, where the Para rubber trees (Hevea brasiliensis) has been successfully introduced, and numerous plantations, many of which have not been in existence for more than ten or fifteen years, are now contributing to the world's supply. This rubber is known as "Plantation" rubber in contradistinction to the "wild" rubber.

"Plantation" Para rubber from Ceylon and the Malay States has brought prices equal to and often exceeding those of fine Para rubber from Brazil. This is largely due to the improved methods of preparing the rubber practised by the planters of Ceylon and Malayá, which lead to the exclusion of the impurities usually found in "wild" rubber. Para rubber from Brazil generally contains about 15% of water, whilst "plantation" Para is usually nearly dry and contains 1% of water or less. It would appear, however, that the finest "wild" Para rubber as a rule possesses greater tensile strength than the "plantation" rubber. This has been ascribed by some to the presence in "wild" rubber of certain impurities derived either from the latex or introduced during the preparation of the rubber which are thought to enhance the physical properties of the caoutchouc. It is more probable, however, that the superiority of the "wild" Para is principally due to the greater age of the forest trees from which the rubber is obtained, many of which are from thirty to fifty years old. It is well known that the Hevea tree usually furnishes very inferior rubber if tapped before it is six or seven years old, and there is evidence to show that the quality of the rubber improves with the age of the tree. The oldest of the plantation trees of Ceylon and Malaya are not much more than twelve years old, whilst it is to be feared that immature trees are often tapped and their latex mixed with that of older trees before coagulation, thus forming inferior rubber. It is therefore to be expected that as time goes on the quality of "plantation" rubber will improve, and there would seem to be no reason why it should not eventually be fully equal to that of the "wild" rubber.

In 1909 the total production of rubber is stated to have been about 70,000 tons, of which more than one-half came from tropical America, about one-third from Africa, whilst the remainder was chiefly of Asiatic origin, including "plantation" rubber from Ceylon and Malayá, which amounted to about 3000 tons.

Chiefly owing to the supplies of "wild" rubber which are still available, comparatively little has been done until recently in establishing plantations either in Africa or in tropical America, but in Asia, including Ceylon, India and Malayá, in which there are relatively few important naturally-occurring rubber plants, there has been for some years great activity in forming plantations of rubber trees introduced mainly from tropical America, and there are now many millions sterling of British capital invested in companies established to form rubber plantations chiefly in Ceylon and Malayá. Each year should therefore show an increase in the production of plantation rubber. No trustworthy estimate of the rate of the increase of production can, however, be formed, as several uncertain economic factors have to be taken into account. Among these are the precise extent of demand, the limit of the inevitable fall in price with largely increased production, the cost of labour as increasing amounts are required, and the effect of changed conditions on the output of "wild" rubber and the competition of the new plantations which are being established in tropical America.

There can be little doubt that with a fall in price further uses for rubber would arise, leading to an increased demand, and among them may be mentioned its utilization as a road material. Difficulties in the supply of labour in the East may hinder the further development of the rubber-planting industry, especially at a period when a reduction in the cost of production may be the chief problem. In 1909 the average cost of producing "plantation" rubber in Ceylon and Malayá...

may be stated approximately to have been from 10d. to 1s. per lb. The cost of collecting “wild” rubber is less easy to state with any approach to accuracy, since the cost varies in different districts of S. and Central America, but the average cost is stated not to be less than 1s. per lb. In Africa the cost of collection is much less, but the rubber is generally of inferior quality.

The market price of commercial rubber is determined by the current price of “fine Para” from S. America. This is subject to considerable fluctuation, and varied in 1900 to 1908 from 2s. 10d. to 5s. 9d. a lb. As much as 65. 9d. per lb was given for specially prepared “plantation Para.” Towards the latter part of 1904 the price of fine Para reached a high level and then considerably declined, reaching in 1907–8 a lower figure than had been recorded since 1900. At the beginning of 1908 the price gradually rose again to the neighbourhood of 4s. a lb. During 1909, without any serious decline in production, the price rapidly rose, owing to extraordinary causes, to about 1s. a lb, and in the early part of 1910 rose to over 1s. a lb, and subsequently fell back to about half that of Para. Having regard to the present cost of producing “plantation” rubber, and to the probability that, apart from a possible increase in the price of labour, this cost is susceptible of further reduction, it may be concluded that rubber production will continue to be profitable even should a considerable fall in market value take place.

The Principal Rubber Trees, their Cultivation, and the Preparation of Rubber.—Most commercial rubber is derived from natural supples, from the wild rubber trees of S. and Central America, India and Africa. Each year, however, the output of “plantation” rubber will show a considerable increase, and it is to be expected that ultimately this will form the chief source of supply, unless unforeseen circumstances should arise to interfere with the development of the plantation industry, which has been vigorously started chiefly with European capital in the tropical possessions of Great Britain, France and Germany. The best rubber is now obtained from large trees, of which the following are the more important:

1. “Para” rubber, which takes the first position in the market, is derived from species of Hevea, principally Hevea brasiliensis, of which there are many varieties. The plantations of Malaysia are established in E. Africa, Ceylon and S. India. The trees are grown in gardens, and also in the vicinity of the gold mines.

2. “Ceara” or Maniçoba rubber is derived from species of Manihot, chiefly Manihot glaziovii, a native of S. America especially abundant in Brazil, and successfully introduced into other countries. The latex is much richer in gum than that of Hevea brasiliensis, and the collection of large quantities of the latex is attended with considerable difficulty. The latex is therefore usually allowed to coagulate on the tree, as it slowly exudes from the incision. On this account it is often exported in strings or “scrap” and not usually in biscuits or bars. Partly for this reason and partly because pieces of wood and dirt are apt to be included with the scrap, the market value of Ceara rubber is usually less than that of Para. The plantations of Malaysia are established in S. Africa, E. Africa and S. India. The rubber is grown in gardens, and also in the vicinity of the gold mines.

3. The “Ule” rubber of Central America and British Honduras originates from Castilla elastica. In S. America its natural occurrence appears to be limited to the west of the Andes, but the tree is abundant in Mexico, Guatemala and Nicaragua. The rubber comes into commerce in thick strips or sheets or as “scrap.” The rubber is usually dark in colour and is often contaminated with protiod impossibility. The latex of the Ule tree differs from that of Para in being much richer in gum, and is sold to Para and commands a lower price. The tree has been experimentally planted in Ceylon, the West Indies and other countries (Plate fig. 14).

4. “Rambong” or Assam rubber is the produce of Ficus elastica, commonly known as the Indian rubber tree and cultivated in Europe as an ornamental plant. This tree, indigenous to Asia, attains large dimensions in India, Celen and the Malay Archipelago (Plate fig. 15). It furnishes most of the rubber of India, Sumatra and Java. Although intrinsically of excellent quality, Rambong rubber, owing to the careless method of collection practised by the natives is usually leads to the inclusion of much impurity, usually fetching a lower price than Para. The tree has been introduced into W. Africa and Egypt, but it has not proved very successful in Africa as a rubber producing tree.

5. “Rubber” is the produce of the African rubber tree Funtunia elastica, which is indigenous to Africa from Uganda to W. Africa (Plate fig. 16). It is known as the silk rubber tree, probably on account of the silky hairs which are attached to the seeds. The latex is usually collected by incising the trunk or from incisions in the bark of the tree. The rubber is of good quality, though, owing to the method of preparation adopted, the product is often impure and discoloured, and consequently usually brings a lower price than the best rubbers of commerce.

6. Besides the trees already mentioned, a number of species or varieties belonging to the Apocynacaeae secrete a latex which furnishes rubber of good quality. These vines are less satisfactory than trees as rubber producers, owing to the readiness with which they are injured and destroyed by careless tapping, and to the difficulty of regulating these methods in the case of vines distributed over enormous areas of forest. Of these vines the most important are the species of Landoldia which occur throughout tropical America. Among the trees of which the sap is called Para is the principal of which are Landolphia ovatensis and L. Heudolotii, common throughout W. Africa, and L. Kirkii and L. Daweii in E. Africa. The rubber is obtained by incising the stems of the vine and collecting the exudation by exposure, by heating with acid vegetables or by boiling. Landolphia rubber is usually roughly prepared and in consequence commands a low price. The vines of species of Guianas and Carpodina in W. Africa are also called Para rubber, and furnished Para rubber to Brazil, Africa, and Guiana and Forsteronia floribunda of Jamaica. Vines resembling Landolphiæ are widely distributed in Asia. Among these are species of Willughbea and Leuconotis, from which much of the rubber exported from Borneo and Celebes, also Hymenornis glandulifera, common in Sumatra, and Borneo, and Urecola caudata and Cryptostegia grandi-flora, both common in Burma.

Among other sources from which rubber is commercially obtained may be mentioned the Guiana plant (Farrhenium argentatum) of Brazil and the “Eccando” rubber of the Andes, obtained from the tuberous roots of which rubber is extracted by the natives. The “Eccando” plant has been named Raphionacme utilis. The root rubber prepared by the natives of the Congo and the S. Sudan is obtained partly from the roots of Landolphia or Carpodina and partly from the rhizomes of Landolphia Tholloni or Carpodina lancelotaeus. It is obtained by breaking up the roots or rhizomes in hot water and separating the rubber, and machines have now been devised for this purpose.

Among the non-tuberous plants that present large latex spouts, the genus Ule presents several species of which Ule longifolia of Tonkin (Bucklera tonsinensis), the latex of which is stated to furnish excellent rubber.
To obtain the latex, deep incisions are made near the base of the tree extending up the trunk. Small shallow cups are placed below the incisions to receive the milk, each cup being attached by sticking a piece of soft clay to the tree and pressing the cup against it. The latex, of which each tree yields only about 6 oz. in three days, has a strong ammoniacal odour, which rapidly disappears, and in consequence of the loss of ammonia the latex will not keep for longer than a day unchanged; hence it has to be carried to a distance from the place of collection, 3% of ammonia solution is added. The latex usually furnished about 30% of rubber.

To obtain the rubber, the latex is usually treated in the following manner. A piece of wood about 3 ft. long, with a flattened end forming a kind of paddle, is dipped in the milk, or this is poured over it as evenly as possible. The milk is then carefully dried by turning the mould round and round in the smoke produced by burning wood mixed with certain oily palm nuts; those of *Alitaeol excelsa* are considered best, the smoke being confined within certain limits by the narrowness of the neck of the pot in which the nuts are heated. The creosote and other products of the smoke no doubt act antiseptically and prevent to a large extent the subsequent putrefaction of the proteins retained by the coagulated rubber. Each layer of rubber is allowed to become firm before forming another; a practised hand can make 6 lb. in an hour. In some districts a stout stick is substituted for the paddle, on which the rubber as it coagulates is wound cylindrically. The rubber thus prepared is the finest that can be obtained. The cakes when completed are, in order to be made into the required form, cut open with a sharp knife, which is kept wet, and are hung up to dry. The flat rounded cakes of rubber made in this manner are known in the London market as "biscuits". They retain about 15% of moisture. The scraps from the tree, which contain fragments of wood mixed with the residues of the collecting pots and the refuse of the vessels employed, are made up into large rounded balls, which form the inferior commercial quality called "negrohead", and often contain 25 or 35% of impurity. The yield of rubber varies, but it is stated on an average to be 10 lb. of rubber per tree, and if carefully tapped one tree will yield this amount for many years in succession.

**Plantations of Hevea brasiliensis.**—Hevea brasiliensis was introduced to Ceylon and Singapore from seedlings raised at Kew from Brazilian seed, specially collected by Mr. H. A. Wickham in S. America. The seedlings rapidly developed and in most places in which they were planted grew into large trees which furnished satisfactory latex when tapped in their sixth or seventh year. Ever sine then plantations of *Hevea* have been made on an increasing scale in the Straits Settlements, the Federated Malay States and in Ceylon, and at the present time rubber plantations form the principal industry in those colonies. Successful plantations of *Hevea* have also been established in Java, Sumatra and Borneo. Many of these plantations have not yet reached the productive stage—that is, the sixth or seventh year. A large number of plantations in British Malaya and Ceylon are now actively exporting increasing quantities of rubber. *Hevea* seedlings were also introduced into India, but did not apparently succeed except in Burma and S. India.

It may be estimated that between one and two million acres of land in the different countries referred to have been already appropriated for rubber plantations. Plantations are also being formed in British, French and German possessions in W. Africa and in the Congo, also in the tropical portions of Australia. In certain districts of British W. Africa the *Hevea* which has been planted promises well, especially in the Gold Coast, where good yields of latex are stated to have been obtained.

It may be useful to summarize here the experience which has been gained in the formation of plantations of *Hevea* and in the production of rubber. *Hevea brasiliensis* is a natural rubber and is most satisfactory at the lowest altitudes on rich soil capable of retaining moisture. The nature of the soil appears, however, to be of secondary importance, provided that it is able to hold moisture and that climatic conditions of high and even temperature and light rainfall and absence of wind are satisfied. Although the tree is sensitive to such conditions, it appears to possess a certain capacity of adaptation which should be borne in mind. Generally a low altitude is desirable, but good results have been obtained in Ceylon in sheltered positions at elevations of 3,000 ft. and over, although at higher altitudes the growth of these trees appears to be slower. In many plantations besides catch crops (cassava, sesame, ground-nuts, &c.) other crops, such as tea, coffee, cocoa and tobacco, are grown with rubber. It is improbably, except in the early stages of the rubber tree, that this procedure will succeed; the rubber will ultimately dominate the position to the detriment and ultimate extinction of the other crop, whilst the growth of the rubber tree may be impaired. A partial exception may perhaps be made in the case of cocoa, when the two plants are placed not too closely in about equal numbers. In these circumstances it appears that satisfactory results may be obtained from both crops, at any rate for a certain number of years to be obtained.

The experience of planters in general is in favour of the complete removal of weeds from a rubber plantation. This practice, which involves periodical weeding, adds considerably to the cost of maintaining plantation and, although justified so far by results, possesses several other disadvantages. During the tropical rain the soil is liable, to a greater or less extent, to denudation, which becomes very serious when the land slopes; and in any case, the soil is apt to become impoverished by the loss of its soluble constituents. These disadvantages are at their maximum when the rubber trees are young. At a later stage the shade of the large trees compensates to a considerable extent for the absence of cover on the ground. Another disadvantage of uncovered soil in a plantation of young rubber trees is that the ground under the best of tropical conditions sun rapidly loses its moisture. For this reason proposals have been made to plant in the place of weeds low-growing leguminous plants, the growth of which will not only prevent impoverishment and loss of soil during the rains and conserve moisture in the bank, but will also have the effect of enriching the soil in nitrogenous constituents through the power leguminous plants possess of absorbing nitrogen from the air through nodules on their roots. Among the plants which have been tried in this purpose various species, notably the passion-flower, and the well-known sensitive plant of the East. The success of the method does not yet be judged, but the experiment is one which deserves very full trial.

One of the most important subjects in connexion with rubber plantations is the method to be adopted in tapping the trees for latex. Two methods in vogue in Brazil and Mexico are primitive and often injurious to the tree. At present it cannot be said that finality has been reached on the subject of the best method, giving a good return of latex with a minimum of damage to the tree. A method at one time largely adopted was to make a series of V-shaped incisions on four sides of the tree, at heights of about 6 ft. from the base—that is, within the reach of an ordinary man without the use of ladder or scaffolding; the latex obtained from the upper part of these incisions to furnish less rubber and of poor quality. The latex is collected in cups placed at the apex of each V. Other systems are the herring-bone plan of a vertical channel.
Rubber

with lateral, connecting channels about 1 ft. apart at an angle of about 45°, the latex being collected in cups placed at the base of the vertical channels (fig. 2); the spiral system, in which a series of grooves are cut all round the trunk, by which means vertical grooves of the entire area of the trunk is tapped. In some instances a combination of these methods is employed. The V-system is the oldest, but is being largely superseded by the herring-bone; the spiral system is more recent and is still on trial.

Instead of the axe or large knives which frequently inflicted serious damage to the tree, hand prickers are now employed so constructed as to avoid injury to the tree through making a larger incision than is necessary, and without penetrating into the wood below the laticiferous layer. It is possible to tap or prickle at any number of points on the trunk, but the practice of tapping on alternate days appears to be safer and to afford equally satisfactory if not better results. The yield of latex is at first small, but increases with successive tapings, which is grooved to regulate the local production of latex, and finally reaches a maximum.

When the bark has been removed a period of from three to four years must elapse before it is so fully renewed as to render fresh incisions possible. In the case of a tree from seven to ten years old, tapping is so arranged that by the time the last incisions on the original growth are made, the new growths on other portions are at least four years old, and ready for new incisions to be made. Too frequent tapping leads to the production of latex poor in caoutchouc, whilst trials before the third year, or say 20 to 25 in. in circumference, produces inferior rubber. As a rule, an annual yield of more than 1-2 lb per tree must not be looked for from recent plantations, although much higher yields up to 4 lb per tree are obtained from S. America, and it is therefore probable that with greater expense as to the best methods of tapping and with older trees considerably larger yields may be expected from plantations in the future. An average of 150 to 200 lb per acre of unhusked rubber might be expected in the second year, at about 100 Rs per acre in the first year, and from 20-30 Rs per acre in subsequent years until the sixth year, when the plantation would begin to be productive.

The highest importance is the coagulation of the latex so as to produce rubber in the form and of the quality required by the manufacturer. The primitive methods of coagulation and curing practised in S. America undoubtedly are susceptible of considerable improvement, and certainly waste can be reduced to a minimum. It is to be regretted that both native processes which result in the production of rubber which command the highest price. As the removal of the impurities of the latex is one of the essential points to be aimed at, it was thought that the use of the centrifugalizing machine (fig. 3) would be successful and that, from the watery part of the latex would prove to be a satisfactory process. This method is said to answer well with the latex of *Castilla*, but it appears to be inapplicable to the latex of *Hevea*, which has a much higher specific gravity.

The plan usually adopted is to collect the latex in rectangular tanks or casks. It is then coagulated by the addition of an acid liquid, acetic acid or lime juice being generally employed, and the coagulated rubber is then washed and dried. The rubber thus formed is washed and dried. The coagulated rubber separated from the watery fluid is cut up into small pieces and passed through the grooved rollers of the washing machine, from which it issues in sheets, long crinkled ribbons or "crepe", which are then dried in hot air chambers or in a vacuum dryer. The rubber is not dried out at atmospheric pressure. In order to prevent decomposition of any proteid impurity which may remain incorporated with the rubber, the freshly coagulated rubber is sometimes cured in the smoke of burning wood or a mixture of charcoal and of an antiseptic such as creosote is added during coagulation.

Plantation rubber comes into commerce in the form of the crinkled ribbons known as crépe, in sheets or biscuits, and sometimes in large blocks, in which the rubber is made to resemble a rubber as nearly as possible tree from water and impurities and of different composition will be realized as best meeting the requirements of the modern manufacturer. The need for scrupulous cleanliness is realized and the arrangements of a rubber factory in Ceylon or Malaya are comparable with those of the modern dairy.

In the present transition stage of rubber production it is necessary for the manufacturer in Europe to wash all rubber. He receives both the wild rubber containing variable quantities of impurity and the purer plantation rubber, the latter, however, in much smaller amount. The fact that at present washing machinery exists in all European factories and that most of the rubber received needs washing, leads to the greater purity of plantation rubber, except for special purposes, being generally discounted by the manufacturer.

As soon as the output of plantation rubber of constant composition has reached much larger dimensions it is probable that the manufacturer will be able to dispense with washing. This will operate to the advantage of the rubber and against the wild rubber, so long as the latter is not exported in a purer condition.

So far the *Hevea* plantations in Ceylon and the East have not been seriously troubled by insect or fungoid pests, and those which have succumbed have been replaced at no expense. One serious trouble which has been occasioned in the Malay States by a white thread-like fungus (*Pomnec seminis*) which attacks the roots of the *Hevea* tree and eventually kills it. The development of this fungoid disease is prevented by the presence of decayed stumps and wood in the plantation. Vigorous measures are now taken in many plantations to remove all old wood and to extract stumps of old trees, which in the first instance it was considered unnecessary to remove.

2. *Manihot glaziovii* belonging to the Euphorbiaceae is the N.E. Brazil which furnishes Ceará or Maniboga rubber (fig. 3). It is closely related to the *Manicaco*, casta or tapioca plant (*Manihot esculenta*) and *M. ulvifolia*) which it resembles when young and exhibits a similar root system. The tree grows well on dry and rocky soil without rain for a considerable period and yields off old branches in any year, and flourishes at high altitudes up to about 4000 ft. It is therefore estimated that under conditions which are unsuitable for *Hevea*.

The tree grows about 50 ft high, the crowded head of foliage, and greyish-green 3 to 7-lobed palmate leaves, somewhat resembling the leaves of the banana plant in shape and size. The seeds (fig. 3), which are abundant and retain their coagulated form when washed, are a thick hard coat. The seeds take a year to germinate, unless the edges near the end bearing the caruncular crossvein are rapped off. Cuttings, if they have a single bud, strike readily.

The trees are tapped when they are about five years old. The mode of collecting the rubber is as follows. After brushing away the leaves cut off the root of the tree, by means of a handful of twigs, the collector pulls down large leaves for the latex to drop upon. He then slices off the outer layer of the bark to the height of 4 or 5 ft. The latex, which exudes slowly and in many cases courses, some of it ultimately falling on the ground, is allowed to remain on the tree for several days, until it becomes dry and solid, and when it is pulled off in strings, which are either rolled up into balls or put into bags in loose masses, in which form it enters commerce. The name of *Ceará* is derived from the eastern coast of Brazil in the form of lumps and cakes. The annual yield of rubber is rather more than 1 lb per tree. The latex coagulates readily, especially if churned or diluted with water, when a purer rubber is obtained.

*Manihot* has been widely introduced into other countries, and appears to succeed wherever the rainfall is not excessive in Ceylon and in some parts of India, especially in Madras, where it has succeeded well. In W. Africa, the tree flourishes, but it is under cultivation. The *Manihot* tree also promises well in E. Africa, Nyasaland and the Mozambique. The pure Ceará rubber, for example the "biscuits" prepared in Ceylon, is of excellent quality, scarcely if at all inferior to Para. That derived from Brazil is generally inferior, being mixed with mud and dirt. The cultivation and collection of the rubber being troublesome, it is unlikely to be attended to in those countries where *Hevea* is successful.

The stones of the *Cordia* rubber from Central America, and of the "Caño" rubber of Peru is *Castilea elatica*, Cerv., a lofty tree, *O. Urticaceae*, with a trunk 3 ft. or more in diameter, and large hairy oblong lanceolate leaves often 18 in. long and 7 in. wide (fig. 4). The tree grows most abundantly in a sporadic manner.
in the dense moist forests of the basin of the Rio San Juan, where the rain falls for nine months in the year. It prefers rich fertile soil on the banks of watercourses, but does not flourish in swamps. It is found also in Costa Rica, Guatemala, Honduras, Mexico, Cuba and Hayti, and in Panama with another species of Castillioa, and on the W. coast of S. America down to the slopes of Chimborazo; the Cordilleras of the Andes separating the Castillioas from the Yerbas of Brazil.

In Nicaragua the latex is collected in April, when the old leaves begin to fall and the new ones are appearing, during which time the latex is richest. The tree is tapped either in the same manner as the Hevea, or by incising the tree with a simple spiral cut at an inclination of 45°, or by two parallel slits in the trunk if the tree be large. At the bottom of the spiral an iron spout about 4 in. long is driven into the tree, and the milk is received in iron pails. A tree 20 to 30 ft. high, with its first branches, and about 4 ft. in diameter, is expected to yield annually 20 gallons of milk, each gallon giving about 1 lb. of rubber. In the evening the milk is strained through a wire sieve and transferred to barrels. The milk, which is acid, is coagulated by adding to it a solution of the "achece" evergreen, or of another plant called "coasso." The strained juice of either of these plants, obtained by bruising the moistened evergreen and subsequent expression, is added to the milk in the proportion of about 1 pint to the gallon. In British Honduras an alkaline decoction prepared from the Mosaic plant (Ficus laurina) is used for the same purpose. If these plants are not procurable, two parts of water are added to one of the milk, and the mixture allowed to stand for twelve hours. The coagulum is next flattened out by a wooden or iron roller, to get rid of the cavities containing watery liquid, and the sheets are then hung up for fourteen days to dry, when they weigh about 2 lb., the sheets being usually ½ to ½ in. thick and 20 in. in diameter. When coagulated in water, the mass is placed in vats in the ground and allowed to dry, this taking place in about a fortnight. It is then stripped free of the sheets, which, in dry weather, are attached to the tree by the incisions in the tree, in the way "bola" or "burucha," and is said to be highly prized in New York. The loss of Nicaragua rubber in drying is estimated at 15%. It is exported chiefly from San Juan del Norte, or León, and the larger proportion goes to the United States. The Castillioa tree appears to be suitable for cultivation only where the Para rubber would grow equally well.

The tree is ready for tapping at about the same age as Elaeu., and the average yield of the two species is about the same. Since the latex "creams" readily the rubber can be separated from the latex by centrifuging, and its quality and market value thus enhanced. Much of the native Castillioa rubber is of inferior quality. The tree has been introduced into the Ceylon and the W. Indies, where it has succeeded well, especially in Trinidad and Tobago. It is also under trial in E. and W. Africa and Nyasaland. Several other species of Castillioa than C. elastica are known to furnish rubber, but little has been recorded as to their advantages.

4. Funtumia elastica (formerly known as Kickxia or Kokia elastica) is the W. African (Ire or Irai or Lagos) rubber tree, which belongs to the Apocynaceae, a natural order which includes the Landolphia vines as well as other rubber producers. It is a large forest tree of upright habit extending to 60 or 70 ft. in height and 3 to 4 ft. in diameter. The bright green, glossy leaves are broad and oblong, about 6 in. in length (see fig. 5). The flowers are yellow, and the seeds enclosed in a pod are long and thin with numerous long silky fibres attached to them, which enable the seeds to be readily carried by the wind. The trees are common throughout the central regions of E. and W. Africa (from Uganda to Sierra Leone). The botanical name is taken from a W. African native name for a rubber tree—"Funtum." Many of the trees in the accessible forests of W. Africa have been destroyed by over-taking and felling. Plantations of Funtumia have been established in the Outeniqua and Natal forests, in Gold Coast and S. Nigeria. The trees are tapped on the "herring-bone" plan and the milk collected in vessels at the base. This is then poured into the hollowed-out trunk of a tree, where it is allowed to stand covered with palm leaves for about a fortnight. The watery portion of the latex soaks into the trunk, and the soft spongy rubber which remains is kneaded and pressed into lumps or balls.

In some districts the collected milk is heated alone or diluted with water, to coagulate the rubber, but if heated alone an inferior rubber is apt to result owing to overheating.

The Funtumia latex can also be coagulated by the astringent infusion of Bauhinia leaves or by exposing it in shallow dishes, when the liquid "creams." The yield of rubber is stated as a rule to be less than that of Para. The rubber, if properly prepared, is of excellent quality, and the tree deserves further attention, especially in those regions of W. Africa which are unsuited to Hevea.

Funtumia africana furnishes a very inferior rubber, which is highly regarded.

5. Ficus elastica is the tree which produces Rambong or Assam rubber. It is well known in Europe as a small ornamental tree, but in the tropics it attains very large dimensions, and develops a system of branching roots which act as buttresses to the large trunk (see fig. 6). It is a native of India, Burma and the Malay Archipelago, and is most abundant in those regions in which the climate is distinctly humid, and subject to high altitudes. In Assam and in upper Burma there are extensive forests of Ficus elastica, but to a large extent the trees have been damaged by careless tapping. Large plantations have been formed by the Government of India both in Assam and Bengal, but most of the rubber exported is still obtained from the forest trees. It has been found that although the tree grows well in many different countries and different localities, it only furnishes a satisfactory yield of rubber in mountainous districts, such as those of Assam and certain parts of Ceylon and Java. The trees are tapped when about ten years old, and as a rule annually furnish from 5–10 lb. of rubber per tree. The latex flows fairly well, but is usually allowed to dry on the tree. The rubber, if of good quality, sells at prices only slightly inferior to that of Para. When the plantations of Ficus in India are in full bearing it is possible that this tree may attract more attention, since the plantation rubber is likely to be of superior quality owing to the greater care taken in its preparation. It seems at present doubtful, however, whether the establishment of plantations of Ficus will be profitable under ordinary conditions in India.

In addition to the trees described above there are numerous plants of some importance as rubber producers. Among these may be mentioned the Landolphia vines, which are still the chief source of African rubber. The vines grow upon forest trees, and the stems are periodically tapped. There are numerous species of these climbing plants, of which the most important as furnishing good rubber are Landolphia ovairiensis (see fig. 7), which occurs throughout
W. Africa and the Sudan, Landolphia Heudelettii of W. Africa, and Landolphia Kirkii and L. Daviei, which are found in the forests of E. Africa. Other species of Landolphia, including Landolphia florado, abundant in both E. and W. Africa, furnish rubber of inferior quality.

Among other shrubs and vines which yield rubber of fair quality may be mentioned Willughbya edulis and Ursula elastica and Parmerio glaberr, which occur in Parma and Malaysia.

The Sapins of Colombia and Guiana are large trees resembling Hevea, and certain species furnish good rubber, especially the Sapin Jermami of Guiana. Most of the native Sapins have been destroyed by reckless tapping, and the merits of this genus have been somewhat overlooked and deserve re-investigation. The same applies to certain species of Hevea, other than H. brasiliensis, which are known to produce good rubber in tropical America.

Pernambuco or Mangabeira rubber is obtained from Lannocarpus speciosa, Gom., an acaceous tree common on the S. American plateau in Brazil from Pernambuco to Rio de Janeiro, at a height of 3000 to 5000 ft. above the sea. It is about the size of an ordinary apple tree, with small leaves like the willow, and a drooping habit like a weeping birch, and has an edible fruit like a yellow plum called mangaba, for which, rather than for the rubber, the tree is cultivated in some districts. Only a small quantity of this rubber comes to England, and it is not much valued, being a "weat" rubber. It is produced in "biscuits" or sheets. The caoutchouc is collected in the following manner: about eight oblique cuts are made around the trunk, but only through the bark, and a tin or three minutes coagulation takes place, and the rubber is then exposed to the air on sticks, and allowed to drain for eight days. About thirty days afterwards it is sent to market. Pernambuco rubber, as is the case with most rubbers coagulated by saline solutions, contains a large quantity of water. The tree has been planted in other countries, but has so far not received much attention. It will grow on a dry sandy soil, dislikes much moisture, and needs no shade.

Fosterina gracilis of Guiana is a climbing plant which also belongs to the Apocynaceae. Like the Fosterina floribunda of Jamaica it yields rubber of good quality. Ficus Vogelii of W. Africa yields rubber of variable quality. The production of rubber by this tree merits further investigation, as it grows readily in nearly every district of W. Africa and the Sudan.

Specimens of the best known and of many of the lesser known rubbers are included in the Colonial and Indian Collections and Sample Rooms of the Imperial Institute, and many of the authentic specimens have been chemically and technically examined in the Scientific and Technical Department of the Institute and commercially valued. Reports on many of the lesser known rubbers have been published in the Bulletin of the Imperial Institute.

Fig. 7.—Landolphia cawariensis. 1, twig with flowers; 2, fruit.

Rubber is chiefly composed of the soft, solid, elastic substance known as caoutchouc. It is usually assumed that this substance is present in the latex to such a degree that the globules in the latex, however, consist more probably of a distinct liquid substance which readily changes into the solid caoutchouc. The coagulation of the latex often originates with the "curdling" of the proteins present, and this alteration in the proteids leads to the solidification of the globules into caoutchouc. The latter, however, is probably a distinct effect. Under certain conditions, as when latex is allowed to stand or is centrifuged, a cream is obtained consisting of the liquid globules, which may be washed free of proteid without change, but, either by mechanical agitation or by the addition of acid or other chemical agent, the liquid gradually solidifies to a mass of solid caoutchouc. The phenomenon therefore resembles the changes known to the chemist as polymerization, by which through molecular aggregation a liquid may pass into a solid without change in its empirical composition. The effect may, however, also be due to chemical change known as condensation, and be accompanied by the elimination of the elements of water. So far the chemical nature of the liquid globules of the latex is unknown, and the exact character of the change into solid caoutchouc remains to be determined. The watery liquid known as rubber milk or latex is an emulsion consisting chiefly of a weak watery solution of proteids, carbohydrates and salts holding the liquid globules in suspension. In connection with the production of rubber the most important factor is the proportion of latex to caoutchouc it contains. In a good gum the proportion of latex varies from 70-90% and over. The proportion and nature of the proteids or albuminous materials varies considerably in different latexes. The proteids should be as far as possible removed during the preparation of the rubber, as these substances are objectionable for the objectionable smell and colour of "native" rubbers, and their presence leads to subsequent change in the commercial material. All crude rubber contains more or less proteid, and in the opinion of some technical experts this presence even enhances its value in the material, but this cannot be accepted as proved. The dissolved salts (potassium, sodium, ammonium, calcium, magnesium, &c.) of the latex are generally nearly entirely absent from the well-prepared rubber, and the objection raised on the inclusion of the resin of the latex with the rubber during coagulation, and although the separation of the resin from the solid caoutchouc by means of solvents is possible, it is not practicable or profitable commercially. A complete examination of a series of different crude rubbers, in many cases, e.g., Hevea and Castilloa, the resin is present in large proportion in the latex derived from young trees, and diminishes in amount as the tree ages. This is one reason why young trees should not be tapped. The composition of latex and of typical rubbers is given below:

The chemical analysis of crude rubber is an important guide to its value. At present, however, the methods of analysis usually employed are not sufficiently delicate to afford all the necessary information as to the intrinsic value of the higher grades of rubber, and do not go much beyond the exclusion of inferior and objectionable grades. The value of the physical properties of crude rubber actually used to determine its value in the market are also very rough and cannot be relied upon. The development of the rubber industry has now reached a stage at which more exact methods of determining the chemical composition and physical properties (strength and elasticity) of rubber are required. At present the caoutchouc present in crude rubber is usually estimated indirectly, and it is possible that what generally passes as caoutchouc may be in some instances mixtures of different rubbers. It would be very desirable to find in those physical properties on which the chemical value of rubber depends.

It is already certain that some commercial rubbers contain a variable proportion of a substance of the nature of caoutchouc, but having different properties.

True caoutchouc, the principal constituent of all rubbers, is probably essentially one and the same substance, from whatever botanical source it may have been derived. This is an elastic, solid, almost transparent in thin sheets, composed entirely of carbon and hydrogen, the empirical composition of which is represented by
the formula \( C_6H_{10} \). It thus possesses the same composition as the hydrocarbon of gutta-percha and as that of oil of turpentine and other terpenes which are the chief components of essential oils. The properties of caoutchouc clearly show, however, that its actual molecular structure is considerably more complex than is indicated by the empirical formula, and that it is to be regarded as the polymer of a terpene or similar hydrocarbon and composed of a cluster of at least ten or twenty molecules of the formula \( C_6H_{10} \). When strongly heated, the composition of caoutchouc changes in its ultimate composition, into a number of simpler liquid hydrocarbons of the terpene class (dipentene, di-isoprene, isoprene, &c.), of which one, isoprene \((C_6H_{10})\), is of simpler structure than oil of turpentine \((C_{10}H_{16})\), from which it can also be obtained by the action of an intense heat.

When this volatile liquid hydrocarbon (isoprene) is allowed to stand for some time in a closed bottle, it gradually passes into a substance having the principal properties of natural caoutchouc. The remaining isoprene is condensed in the manometric vessel and may be removed by the action of certain chemical agents. It may therefore be said that caoutchouc has been already artificially or synthetically prepared, and the possibility of producing synthetic rubber cheaply on a commercial scale remains the only problem. At present the change of isoprene into caoutchouc is mainly of scientific interest in indicating possibilities with regard to the conversion of the liquid globules of the latex into rubber and to the formation of rubber as a primary product by the elimination of water. The problem is, however, not determined, and recent researches point to the view that its molecular structure may even be somewhat different from that of the terpenes.

The exact nature in which isoprene passes into caoutchouc is also not understood. These problems are, however, certain to be solved in the near future, and then probably caoutchouc may be formed in other ways than from isoprene.

Rubber, like other "unsaturated" molecules, forms compounds with chloroform, bromine, iodine and sulphur.

**Commercial Treatment of Rubber.**

In the industrial working of indiarubber, the various impurities present in the crude "wild" rubber (bark, dirt and the principal impurities derived from the latex, except resin) are removed by the following process: The lumps of crude caoutchouc are first softened by the prolonged action of hot water, and then cut into slices hot necessary for vulcanization generally by hand, as they are too large for stones or other foreign substances can be removed. The softened slices are now repeatedly passed between grooved rollers, known

![Fig. 8.—Roller of Washing Machine.](image)

as washing rollers (Fig. 8), a supply of hot or cold water being made available in order to moderate the temperature of the rubber. The slices are then sorted, and finally washed and dried. In this process they are subjected to the action of a washing machine, which consists of a strong cylindrical cast-iron casing, in which there revolves a metal cylinder with a fluted or corrugated surface. Some of the rubber having been placed in the annular space between the inner cylinder and the outer casing, the former is made to revolve; and the continued kneading action to which the rubber is subjected works it into a solid mass, something like a gigantic sausage. Before commencing the mastication it is generally necessary to warm the apparatus by means of steam; but as the operation proceeds the heat produced of itself moderates by streams of cold water flowing through channels provided for the purpose. The inner cylinder is generally placed somewhat eccentrically in the outer casing, in order to render the kneading more perfect than would otherwise be the case.

To convert the masticated rubber into rectangular blocks, it is first softened by heat, and then forced into iron boxes or moulds. The blocks are cut into thin sheets by means of a sharp knife, which is caused to move to and fro a few thousand times per minute, the knife being kept moistened with water, and the block fed up to it by mechanical means. Cut sheets are largely used for the fabrication of certain classes of rubber goods—these being made by cementing the sheets together with a solution of rubber in naphtha or benzene. Most articles made of cut sheet rubber would, however, be of very limited utility were they not hardened or Vulcanized by the action of sulphur or some compound of that element. After vulcanization, rubber is no longer softened by a moderate heat, a temperature of 160° C, or moderately affecting it, nor is itredient right by cold, and the ordinary solvents fail to dissolve it. It must, however, be distinctly understood that it is not the mere admixture but the actual combination of sulphur with indiarubber that causes the above noted characteristic properties.

At higher temperatures the viscous liquid suffers decomposition with the formation of various liquid hydrocarbons, principally members of the terpene series. Similar products are also formed by the volatile isoprene, which closely resembles caoutchouc in its chemical structure.

Rubber slowly absorbs oxygen when exposed to air and light, the absorption of oxygen being accompanied by a gradual change in its physical properties, rubber, and ultimately to the production of a hard, inelastic, brittle substance containing oxygen. Ozone at once attacks rubber, rapidly destroying it. If ozone is passed into a solution of rubber in chloroform the caoutchouc combines with a molecule of ozone forming a compound of the empirical composition \( C_6H_{10}O_2 \). When this compound is acted on by water, hydrogen peroxide and levulinic aldehyde are formed, the aldehyde being subsequently oxidized by the hydrogen peroxide, forming levulinic acid. The hydrocarbon of gutta-percha yields similar results and is therefore closely related to caoutchouc.

The study of the action of ozone on caoutchouc has thrown new light on the complex question of the chemical structure of this substance, and discloses relationships with the sugars and other carbohydrates from certain of which levulinic acid is obtained by oxidation. The carboxyl groups of the hydrocarbon, which, like those of most of the sugars, are of the formula \( HO\).....
saturated by being laid in powdered sulphur maintained for some hours at about 110°C. Sheets sulphured in this way can be made up into articles and joined together either by warming the parts to be united, or by means of indiarubber solution; after which the true vulcanization, or curing, as it is termed, can be brought about in the usual way.

Another method of vulcanizing articles made from cut sheet rubber consists in exposing them to the action of chlorine or sulphur. Either they are placed in a leaden cup and when the vapour is introduced, or they are dipped for a few seconds in a mixture of one part of chlorine of sulphur and forty parts of carbon disulphide or purified light petroleum. Vulcanization takes place in this instance without the action of heat; but it is usual to warm the goods for a short time to a temperature of 40°C after their removal from the solution, in order to drive off the liquid which has been absorbed, and to ensure a sufficient action of the chlorine or sulphur. Treatment with a warm alkaline solution is afterwards advisable, in order to remove traces of hydrochloric acid generated during the process. Another very excellent method of vulcanizing cut sheet goods consists in placing them in a solution of the poly-sulphides of calcium at a temperature of 140°C. Rubber employed for this purpose is left in the solution, it is usual to incorporate with the paste, and to effect vulcanization by steam heat; but, when silk or wool is employed, no sulphur is added to the paste, the dried coating of rubber being brought into contact with an excess of chlorine of sulphur and carbon disulphide already mentioned.

Double texture goods are made by uniting the rubber surfaces of two pieces of the coated material. Air goods, such as cushions, beds, gas-bags, &c., can be coated with mixed rubber either by the spreading process above described, or by means of heated rollers, the curing being then effected by steam heat. The manufacture of overshoes and fishing boots is an analogous process, only the canvas base is more thickly coated with a highly pigmented paste of rubber. Articles are first fashioned by joining the soft material; they are then varnished, and afterwards cured in ovens heated to about 135°C. The fine vulcanized "spread sheets" are made by spreading layers of a paste containing the rubber, already charged with a fixed proportion of sulphur, on a textile base previously prepared with a mixture of paste, glue, and treacle. Vulcanization is then effected by steam heat, and, in many cases, the cloth being softened by warm water, the layer of rubber is spread over it. The thickness of the spread sheet is very often secured by the rubber-faced surfaces of two cloths being united before curing. The threads used in making elastic webbing are usually cut from spread sheets. The preparation of spread sheet or rubber cloth is easily made, and any very special notice, these articles being generally fashioned out of mixed rubber, and vulcanized either in moulds or in powdered French chalk. Rollers are made to adhere to their metal spindles by the interposition of a layer of rubber or ebonite, on which they are turned. In order to make spongy or porous rubber, some material is incorporated which will give off gas or vapour at the vulcanizing temperature,—such as carbonate of ammonia, crystalline soda, and finely divided sand. When the excess of sulphur is injurious, and often leads to the decay of vulcanized goods, but an excess of sulphur is generally required in order to ensure perfect vulcanization. Sometimes the excess is partially removed by boiling the finished goods with a solution of caustic soda, or some other solvent of sulphur. In other cases the injurious effects of free sulphur are obviated by using instead of it a metallic sulphide,—generally the orange sulphide of antimony; but, for the best results, it is necessary to add to it that should contain from 20 to 30% of uncombined sulphur.

It will thus be seen that for nearly all practical purposes, including tires, vulcanized rubber mixed with mineral matter is employed. Such articles contain varying proportions of rubber (20-50%), from 45% to 50% of combined mixed rubber, and 45% of combined mineral matter. Vulcanized rubber is also largely used as an electrical insulator for the construction of cables, &c., instead of gutta-percha.

When the vulcanization of rubber is carried too far, from the presence of a very large proportion of sulphur and an undue action of heat, the caoutchouc becomes hard, horn-like, and often black. Rubber hardened by over-vulcanization is largely manufactured under the name of ebonite or vulcanite. It is usually obtained by incorporating such proportion of powdered rubber by means of the usual mixing rollers, shaping the required articles out of the mass thus obtained, and heating for six, or ten hours to 135°C to 150°C. Ebonite takes a fine polish, and is valuable for the electrical machinery, and for the manufacture of artificial teeth, and to the chemist and photographer because vessels made of it are unaffected by most chemical reagents. A kind of vulcanite which contains a large proportion of pigment or other mineral matter is the name of dental rubber, for making artificial gums and supports for artificial teeth.

RUBBLE, broken stone, of irregular size and shape. This word is closely connected in derivation with “rubbish,” which was formerly also applied to what we now call “rubble.” The earlier Middle English form was robena or robous. It would appear that the original is an O. Fr. robeh. Robe (older form robba) is found in Italian in the sense of refuse, trash. Robba is explained by Florio as a gown, or mantle, robe, wealth, goods, trash. The original sense was “spoil.” Thus, “robe,” “roby,” “rubbish” and “rubble” are all cognate.

“Rubble-work” is a name applied to several species of masonry (q.v.). One kind, where the stones are loosely thrown together in a wall between boards and grouted with mortar almost like concrete, is called in Italian muraglia di getto and in French bocage. Work executed with large stones put together without any attempt at courses is also called rubble.

RUBELLITE, a red variety of tourmaline (q.v.) used as a gem-stone. It generally occurs crystallized on the walls of cavities in coarse granitic rocks, where it is often associated with a pink lithia-mica (lepidolite). The most valued kinds are deep red; the colour being probably due to the presence of manganese. Some of the finest rubellite is found in Siberia, where it is disposed of in the form of chips and ground to powder under the mislating name of “Siberian ruby.” The mills at Ekaterinburg, where it is cut and polished, draw most of their supplies from the Ural Mountains—chiefly from Murinsk, Sarapulskaya and Shaitanka, near Ekaterinburg—but specimens are occasionally found at Nercinsk in Transbaikalia. Burma is famous for rubellite, but little was known as to the conditions of its occurrence there until after the British annexation, when the old workings were visited and described by C. Barrington Brown and by F. Noetling. The pits which yield rubellite are dug in alluvial deposits in the Mön-long valley, some miles to the S.E. of Mogok, the centre of the ruby country. It was here that the Chinese obtained the rubellite so much valued in China for buttons of the caps of mandarins of certain rank.

In the British Museum there is a remarkable specimen of crystallized rubellite of large size and fine form, but of poor colour, which was presented by the king of Ava to Colonel Michael Symes on the occasion of his mission in 1795. Very fine rubellite is found in the United States, notably at Mount Mica, near Paris, Oxford Co., Maine, where the crystals are often red at one end and green at the other. Mount Rubellite, near Hebron, and Mount Apatite at Auburn, are other localities in the same state from which fine specimens are obtained. Chesterfield and Goshen, Mass., also yield red tourmaline, frequently associated with green in the same crystal. Pink tourmaline also occurs, with lepidolite and kunzite, in San Diego Co., California. In Europe rubellite occurs sparingly at a few localities, as at San Piero in Elba and at Penig in Saxony; but the mineral is rarely if ever fit for the lapidary.

RUBENS, PETER PAUL (1577-1640), Flemish painter, was born at Siegen, in Westphalia, on the 29th of June 1577. His father, Johannes Rubens, a druggist, although of humble descent was a man of learning, and councillor and alderman in his native town (1561). A Roman Catholic by birth, he became a zealous upholder of the Reformation, and we find him spoken of as le plus docte Calviniste qui fut pour lors au Bas Pays. After the plundering of the Antwerp churches in 1566, the magistrates were called upon for a justification. While openly they declared themselves devoted sons of the church, a list of the followers of the Reformed creed, headed by the name of Anthony Van Stralen, the burgomaster, got into the hands of the duke of Alva. This was a sentence of death for the magistrates, and Johannes Rubens lost no time in quitting Spanish soil, ultimately settling at Cologne (October 1568) with his wife and four children.

In his new residence he became legal adviser to Anne of Saxony, the second wife of the prince of Orange, William the Silent. Before long it was discovered that their relations were not purely of a business kind. Thrown into the dungeons of Dillenburg, Rubens lingered there for many months, his wife, Maria Pypelinckx, never relaxing her endeavours to get the undutiful husband restored to freedom. Two years elapsed before the prisoner was released, and then only to be confined to the small town of Siegen. Here he lived with his family from 1573 to 1578, and here Maria Pypelinckx gave birth to Philip, afterwards town-clerk of Antwerp, and Peter Paul. A year after (May 1578) the Antwerp lawyer got leave to return to Cologne, where he died on the 18th of March 1587, after having, it is said, returned to Roman Catholicism.

Rubens went to Antwerp with his mother when he was scarcely ten years of age. He was an excellent Latin scholar, and also proficient in French, Italian, Spanish, English, German and Dutch. Part of his boyhood he spent as a page in the household of the countess of Lalaing, in Brussels; but tradition adds that his mother allowed him to follow his proper vocation, choosing as his master Tobias Verhaecht. Not the slightest trace of this first master's influence can be detected in Rubens's works. Not so with Adam Van Noort, to whom the young man was next apprenticed. Van Noort, whose aspect of energy is well known through Van Dyck's beautiful etching, was the highly esteemed master of numerous painters—among them Van Balen, Sebastian Frans, and Jordans, later his son-in-law.

Rubens remained with Van Noort for the usual period of four years, thereafter studying under Otto Vaeuvin or Van Veen, a gentleman by birth, a most distinguished Latin scholar and a painter of very high repute. He was a native of Leiden, and only recently settled in Antwerp. Though Rubens never adopted his style of painting, the tastes of master and pupil had much in common, and some pictures by Otto Vaeuvin can be pointed out as having inspired Rubens at a more advanced period. For example, the "Magdalene anointing Christ's Feet," painted for the cathedral at Malaga, and now at the Hermitage in St Petersburg, closely resembles in composition the very important work of Otto Vaeuvin in the church at Bergues near Dunkirk.

In 1588, Adam Van Noort acting as dean of the Antwerp guild of painters, Rubens was officially recognized as "master"—that is, was allowed to work independently and receive pupils. His style at this early period may be judged from the by no means satisfactory "Holy Trinity" at Antwerp Museum, which already shows his bold, vigorous handling, and the "Portrait of a Youth" in the Munich Pinakothek.

From 1600 to the latter part of 1608 Rubens belonged to the household of Vincenzo Gonzaga, duke of Mantua. The duke, who spent some time at Venice in July 1600, had his attention drawn by one of his courtiers to Rubens's genius, and immediately induced him to enter his service. The influence of the master's stay at Mantua was of extreme importance, and cannot be too constantly kept in view in the study of his later works.

Sent to Rome in 1601, to take copies from Raphael for his master, he was also commissioned to paint several pictures for the church of Santa Croce, by the archduke Albrecht of Austria, sovereign of the Spanish Netherlands, and once, when he was a cardinal, the titular of that see. A copy of "Mercury and Psyche" after Raphael is preserved in the museum at Pesth. The religious paintings—"The Invention of the Cross," "The Crowning with Thorns" and "The Crucifixion"—are to be found in the hospital at Grasse in Provence (Alpes Maritimes).

At the beginning of 1603, "The Fleming," as he was termed at Mantua, was sent to Spain with a variety of presents for Philip III, and his minister the duke of Lerma, and thus had opportunity to spend a whole year at Madrid and become acquainted with some of Titian's masterpieces. Of his own works, known to belong to the same period, in the Madrid Gallery, are "Heracletus" and "Democritus." Of Rubens's abilities so far back as 1604 we get a more complete idea from an immense picture now in the Antwerp Gallery, the "Baptism of Our Lord," originally painted for the Jesuits at Mantua. Here it may be seen to what degree Italian surroundings had influenced the household painter of Vincenzo Gonzaga. Vigorous to the extreme in design, he reminds us of Michelangelo as much as any of the degenerate masters of the Roman school.
while in decorative skill he seems to be descended from Titian and
and in colouring from Giulio Romano. Equally with this picture, "The
Transfiguration," now in the museum at Nancy, and the portraits of "Vincenzo and his Consort, kneeling before the
Trinity," in the library at Mantua, claim a large share of
attention.

Two years later we meet a very large altar-piece of "The
Circumcision" at St Ambrogio at Genoa, the "Virgin in a Glory
of Angels," and two groups of Saints, painted on the wall, at
both sides of the high altar in the church of Santa Maria in
Valicella in Rome. These works remind us of a saying of
Baglione, who was acquainted with Rubens in Italy: "Apprese
egli buon gusto, e dicea in una maniera buona Italiana.

While employed at Rome in 1608, Rubens received alarming news
as to the state of his mother's health. The duke of Mantua was then absent from Italy, but the dutiful son, 
without awaiting his return, at once set out for the Netherlands. When he arrived in Antwerp, Maria Pypelincx was no more. However strong his wish might now be to return to Italy, his purpose was overruled by the express desire of his sovereigns,
Albrecht and Isabella, to see him take up a permanent residence
in the Belgian provinces. On the 3rd of August 1609 Rubens
was named painter in ordinary to their Highnesses, with a
salary of 500 livres, and "the rights, honours, privileges, 
exemptions," &c., belonging to persons of the royal household,
not to speak of the gift of a gold chain. Not least in importance
for the painter was his complete exemption from all the regula-
tions of the gild of St Luke, entitling him to engage any pupils
or fellow-workers without being obliged to have them enrolled
—a favour which has been of considerable trouble to the historians of Flemish art.

Although so recently returned to his native land, Rubens
seems to have been, with one accord, accepted by his country-
men as the head of their school, and the municipality was
foremost in giving him the means of proving his acquirements. The first in date among the numerous repetitions of the "Adora-
tion of the Magi" is a picture in the Madrid Gallery, measuring
12 ft. by 17, and containing no fewer than eight-and-twenty
life-size figures, many in gorgeous attire, warriors in steel
armour, horsesmen, slaves, camels, &c. This picture, painted
in Antwerp, at the town's expense, in 1609, had scarcely re-
mained three years in the town hall when it went to Spain as
a present to Don Rodrigo Calderon, count of Oliva. The
painter has represented himself among the horsemen, bare-
headed, and wearing his gold chain. From a letter written in
May 1611 we know that more than a hundred young men were
desirous to become his pupils, and that many had, "for several years," been waiting with other masters until he could admit
them to his studio.

Apart from the success of his works, another powerful motive
had helped to detain the master in Antwerp—his marriage
with Isabella Brant (October 16). Many pictures have
made us familiar with the graceful young woman who was for
seventeen years to share the master's destinies. We meet her
at the Hague, St Petersburg, Berlin, Florence, at Grosvenor
House, but more especially at Munich, where Rubens and his
wife are depicted at full length on the same canvas. "His
wife is very handsome," observes Sir Joshua Reynolds, "and
has an agreeable countenance;" but the picture, he adds,
"is rather hard in manner." This, it must be noted, is the
case with all those pictures known to have immediately followed
Rubens's return, when he was still dependent on the assist-
ance of painters trained by others than himself. Even in the
"Raising of the Cross," now in the Antwerp cathedral, and
painted for the church of St Walburga in 1610, the dryness in
outline is very striking.

According to the taste still at that time prevailing, the
picture's tripod is wrapped in the wings only serve to develop the
central composition, and add to the general effect. In Wit-
doeck's beautiful engraving the partitions even disappear.
Thus, from the first, we see Rubens quite determined upon
having his own way, and it is recorded that, when he painted
the "Descent from the Cross," "St Christopher," the subject
chosen by the Arquebusiers, was altered so as to bring the
artistic expressions into better accordance with his views.
Although the subject was frequently repeated by the great
painter, this first "Descent from the Cross" has not ceased
to be looked upon as his masterpiece. Begun in 1611, the
celebrated work was placed in 1614, and certainly no more striking evidence could be given of the rapid growth of the
author's abilities. Rubens received 2,400 florins for this picture.
In many respects, Italian influence remains conspicuous in
the "Descent from the Cross." Rubens had seen Ricciarelli's
fresco at the 'Trinita de' Monti, and was also acquainted with
the grandiose picture of Barocci in the cathedral of Perugia,
and no one conversant with these works can mistake their
influence. But in Rubens strength of personality could not
be overpowerd by reminiscence; and in type, as well as in
colouring, the "Descent from the Cross" may be termed
thoroughly Flemish and Rubenesque.

If Sir Dudley Carleton could speak of Antwerp in 1616 as
Magna civitas, magna solitudo, there was no place never-
less which could give a wider scope to artistic enterprise.
Spain and the United Provinces were for a time at peace; almost
all the churches had been stripped of their adornments;
monastic orders were powerful and richly endowed, gilds
and corporations eager to show the fervour of their Catholic faith,
now that the "monster of hebetas" seemed for ever quelled.
Gothic churches began to be decorated according to the new
fashion adopted in Italy. Altars magnified to monuments,
sometimes reaching the full height of the vaulted roof, dis-
played, between their twisted columns, pictures of a size hitherto
unknown. No master seemed better fitted to be associated
with this kind of painting than Rubens. The temple erected
by the reverend fathers in Antwerp was almost entirely the
painter's work, and if he did not, as we often find asserted,
decorations of churches, in which he was either employed in
the building. Hitherto no Fleming had undertaken to paint
ceilings with foreshortened figures, and blend the religious
with the decorative art after the style of those buildings which
are met with in Italy, and owe their decorations to masters
like Titian, Veronese and Tintoretto. No fewer than forty
celling-panels were composed by Rubens, and painted under his
direction in the space of two years. All were destroyed by
fire in 1718. Sketches in water-colour were taken some time
before the disaster by de Witt, and from these were made the
tetchings by Du Pont which alone enable us to form a judgment
of the grandiose undertaking. In the Madrid Gallery we find
a general view of the church in all its splendour. The present
church of St Charles in Antwerp is, externally, with some
alteration, the building here alluded to.

Rubens delighted in undertakings of the vastest kind. "The
large size of a picture," he writes to W. Trumbull in 1621, "gives
us painters more courage to represent our ideas with the utmost
freedom and semblance of reality. . . . I confess myself to be,
by a natural instinct, better fitted to execute works of the
largest size." The correctness of this appreciation he was
very soon called upon to demonstrate most strikingly by a
series of twenty-four pictures, illustrating the life of Marie de
Medicis, queen-mother of France. The gallery at the Luxem-
bourg Palace, which these paintings once adorned, has long
since disappeared, and the complete work is not exhibited in
the Louvre. Drawings, it seems, had been asked from Quentin
Varin, the French master who incited Poussin to become a
painter, but Rubens was ultimately preferred. This preference
may in some degree be ascribed to his former connexion with
the court at Mantua, Marie de Medicis and the duchess of
Gonzaga being sisters. From the cradle to the day of her
reconciliation with Louis XIII., we follow Marie de Medicis
after the manner in which it was customary in those days to
consider personages of superior rank. The Fates for her have
spun the silken and golden thread; Juno watches over her
birth and entrusts her to the town of Florence; Minerva,
the Graces and Apollo take charge of her education; Love
exhibits her image to the king, and Neptune conveys her across the seas; Justice, Health and Plenty endow her son; Prudence and Generosity are at her sides during the regency; and, when she resigns the helm of the state to the prince, Justice, Strength, Religion and Fidelity hold the oars. The sketches of all these paintings—now in the Munich Gallery—were painted in Antwerp, a numerous staff of distinguished collaborators being entrusted with the final execution. But the master himself spent much time in Paris, retouching the whole work, which was completed within less than four years. On the 15th of May 1625, Rubens writes from Paris to his friend Peiresc that both the queen and her son are highly satisfied with his paintings, and that Louis XIII. came on purpose to the Luxembourg, "where he never has set foot since the palace was begun sixteen or eighteen years ago." We also gather from this letter that the picture representing the "Felicity of the Regency" was painted to replace another, the "Departure of the Queen," which had caused some offence. Richelieu gave himself some trouble to get part of the work, intended to represent the life of Henry IV., bestowed upon Cavalier d'Arpinia, but he did not succeed in his endeavours. The queen's exile, however, prevented the undertaking from going beyond a few sketches, and two or three panels, one of which, the "Triumph of Henry IV.," now in the Uffizi Gallery, is one of the noblest works of Rubens or of any master.

On the 11th of May 1625, Rubens was present at the nuptials of Henrietta Maria at Notre Dame in Paris, when the scaffolding on which he stood gave way, and he tells us he was just able to catch an adjoining tribune.

No painter in Europe could now pretend to equal Rubens either in talent or in renown. Month after month productions of amazing size left the Antwerp studio; and to those unacquainted with the master's pictures magnificent engravings by Vorsterman, Pontius and others had conveyed singularly striking interpretations. "Whatever work of his I may require," writes Moretus, the celebrated Antwerp printer, "I have to ask him six months before, so that as he may think of it at leisure, and do the work on Sundays or holidays; no week days of his could I pretend to get under a hundred florins."

Of the numerous creations of his brush, none, perhaps, will more thoroughly disclose to us Rubens's comprehension of religious decorative art than the "Assumption of the Virgin" at the high altar of Antwerp cathedral, finished in 1625. It is, of twenty repetitions of this subject, the only example still preserved at the place for which it was intended. In spirit we are here reminded of Titian's "Assunta" in the cathedral at Verona, but Rubens's proves perhaps a higher conception of the subject. The work is seen a considerable way off, and every outline is bathed in light, so that the Virgin is elevated to dazzling glory with a power of ascension scarcely, if ever, attained by any master.

Although able to rely so greatly on his power as a colourist, Rubens is not a mere decorator. He penetrates into the spirit of his subject more deeply than at first sight, seems conscious of his prodigious facility in execution. The "Massacre of the Innocents," in the Munich Gallery, is a composition that can leave no person unmoved—mothers defending their children with nails and teeth. When St Francis attempts to shelter the universe from the Saviour's wrath (Brussels Gallery), Rubens recalls to our memory that most dramatic passage of the IIiad when Heebua, from the walls of Troy, entreats her son Hector to spare his life. Rubens was a man of his time; his studies of Italian art in no way led him back to the Quattrocentisti nor to the Rafaelleschi; their power was at an end. The influence of Michelangelo, Titian, Tintoretto, more especially Barocco, Polidoro, and even Parmigianino, is no less visible with him than with those masters who, like Spranger, C. Schwartz and Goltzius, stood high in public estimation immediately before his advent.

In the midst of the rarest activity as a painter, Rubens was now called upon to give proofs of a very different kind of ability. The truce concluded between Spain and the Netherlands in 1609 ended in 1612; Archduke Albrecht died the same year. His widow sincerely wished to prolong the arrangement, still hoping to see the United Provinces return to the Spanish dominion, and in her eyes Rubens was the fittest person to bring about this conclusion. The painter's comings and goings, however, did not remain unheeded, for the French ambassador writes from Brussels in 1624—"Rubens is here to take the likeness of the prince of Poland, by order of the infanta. I am persuaded he will succeed better in this than in his negotiations for the truce." But, if Rubens was to fail in his efforts to bring about an arrangement with the Netherlands, other events enabled him to render great service to the state.

Rubens and Buckingham met in Paris in 1625; a correspondence of some importance had been going on between the painter and the Brussels court, and before long it was proposed that he should endeavour to bring about a final arrangement between the Crowns of England and Spain. The infanta willingly consented, and King Philip, who much objected to the interference of an artist, gave way on hearing, through his aunt, that the negotiator on the English side, Sir Balthasar Gerbier—a Fleming by birth—was likewise a painter. Rubens and Gerbier very soon met in Holland. Matters went on very well, and Rubens volunteered to go to Spain and lay before the council the result of his negotiations (1628). Nine months were thus spent at Madrid; they rank among the most important in Rubens's career. He had brought with him eight pictures of various sizes and subjects as presents from the infanta, and he was also commissioned to paint several portraits of the king and royal family. An equestrian picture of Philip IV., destroyed by fire in last century, became the subject of a poem by Lope de Vega, and the description enables us to identify the composition with that of a painting now in the Palazzo Pitti, ascribed to Velasquez.

Through a letter to Peiresc we hear of the familiar intercourse kept up between the painter and the king. Philip delighted to see Rubens at work in the studio prepared for him in the palace, where he not only left many original pictures, but copied for his own pleasure and profit the best of Titian's. An artistic event of some importance connected with the sojourn in Spain is the meeting of Rubens and Velasquez, to the delight, and, it may be added, advantage of both.

Great as was the king's admiration of Rubens as a painter, it seems to have been scarcely above the value attached to his political services. He now commissioned the painter to go to London as bearer of his views to Charles I., and Rubens, honoured with the title of secretary of the king's privy council in the Netherlands, started at once on his new mission. Although he stopped but four days in Antwerp, he arrived in London just as peace had been concluded with France. Received by Charles with genuine pleasure, he very soon was able to ingratiate himself so far as to induce the king to pledge his royal word to take part in no undertakings against Spain so long as the negotiations remained unconfirmed, and all the subsequent endeavours of France, Venice and the States found the king immovable in this resolution. The tardiness of the Spanish court in sending a regular ambassador involved the unfortunate painter in distressing anxieties, and the tone of his despatches is very bitter. But he speaks with the greatest admiration of England and the English, regretting that he should only have come to know the country so late. His popularity must have been very great, for on the 23rd of September 1629 the university of Cambridge conferred upon him the honorary degree of master of arts, and on the 21st of February 1630 he was knighted, the king presenting him with the sword used at the ceremony, which is still preserved by the descendants of the artist.

Although, it seems, less actively employed as an artist in England than in Spain, Rubens, besides his sketches for the decoration of the Banqueting Hall at Whitehall, painted the admirable picture of "The Blessings of Peace," now in the
Rubens was now fifty-three years of age; he had been four years a widower, and before the end of the year (December 1630) he entered into a second marriage with a beautiful girl of sixteen, named Helena Fourment. She was an admirable model, and none of her husband's works may be more justly termed masterpieces than those in which she is represented (Munich, St Petersburg, Blenheim, Liechtenstein, the Louvre, &c.).

Although the long months of absence could not be termed blanks in Rubens's artistic career, his return was followed by an almost incredible activity. Inspired more than ever by the glorious works of Titian, he now produced some of his finest compositions in colouring, breadth of touch and pictorial conception, are specially striking in those works we know to have been painted in the latter part of his lifetime. Could anything give a higher idea of Rubens's genius than, for example, the "Feast of Venus," the portrait of "Helena Fourment ready to enter the Bath," or the "St Ildefonso?" This last picture—now, as well as the two others just alluded to, in the Vienna Gallery—was painted for the church of the convent of St Jacques, in Brussels. On the wings are represented the archdukes in royal attire, under the protection of their patron saints. The presence of these figures has led to some mistake regarding the date of the production, but it has been proved beyond doubt, through a document published by Mr Castan (1884), that the "St Ildefonso" (at Vienna—there is another resembling it at St Petersburg) belongs to the series of works executed after the journeys to Spain and England. Archduke Albrecht had been dead ten years. The picture was engraved by Witschoek in 1638.

Isabella died in 1633, and we know that to the end Rubens remained in her favour, with her, alike as an artist and as a political agent. The painter was even one of the gentlemen she deputed to meet Marie de Médicis at the frontier in 1631, after her escape from France.

Spain and the Netherlands went to war again, the king never ceasing to look upon the Dutch as rebels, and much trouble and suspicion came upon the great artist. As to the real nature of his communings with Frederick Henry of Orange, whom he is known to have interviewed, nothing as yet has been discovered.

Ferdinand of Austria, the cardinal-infant of Spain, was called to the government of the Netherlands on the death of his aunt. He was the king's younger brother, and arrived at Antwerp in May 1633. The streets had been decorated with triumphal arches and "spectacula," arranged by Rubens, and certainly never equalled by any other works of the kind.1 Several of the paintings detached from the arches were offered as presents to the new governor-general, a scarcely known fact, which accounts for the presence of many of these works in public galleries (Vienna, Dresden, Brussels, &c.). Rubens was at the time laid up with gout, but Prince Ferdinand was desirous of expressing his satisfaction, and called upon the painter, remaining a long time at his house. Rubens and Ferdinand had met at Madrid, and only a short time elapsed before the painter was confirmed in his official standing—a matter of small importance, if we consider that the last years of his life were almost exclusively employed in working much more for the king than for his brother. About a hundred and twenty paintings of considerable size left Antwerp for Madrid in 1637, 1638 and 1639, that were intended to decorate the pavilion erected at the Parado, and known under the name of Torre de la Parada. Another series had been begun, when Ferdinand wrote to Madrid that the painter was no more, and Jordaens would finish the work. Rubens breathed his last on the 30th of May 1640.

More fortunate than many artists, Rubens left the world in the midst of his glory. Not the remotest trace of approaching old age, not the slightest failing of mind or skill, can be detected even in his latest works, such as the "Martyrdom of St Peter" at Cologne, the "Martyrdom of St Thomas" at Prague, or the "Judgment of Paris," at Madrid, with justice the same.

Rubens has little of the Italian grace and refinement; he was a Fleming throughout, notwithstanding his frequent recollections of those Italian masters whom he most admired, and who themselves must be borne in mind how completely his predecessors were frozen into stiffness through imitation, and how necessary it was to bring back the Flemish school to life and nature. Critics have spoken of his historical improprieties. Of course nobody could suppose that his classical learning did not go far enough to know that the heroines of the Old Testament or of Roman history were not dressed out as ladies of his time; but in this he only follows the example of Titian, Paolo Veronese, and many other of the Venetian masters. We find the same animal pictures of lions, tigers, and even the hippopotamus and the crocodile, which may be reckoned among the finest specimens of art, and here again life and nature displayed with the utmost power. 2 His horses are perfect in their nobleness. His Reynoldsian pictures of the strong Flemish breed, and his landscapes the most charming pictures of Brabant scenery, in the midst of which lay his seat of Steen. As a portrait painter, although less refined than Van Dyck, he shows that eminent master and his school could not have been as ancient as one (Madrid and Dresden) and the "Village Feast" (Louvre), have never been equalled.

For nearly one hundred years the Flemish school may be said to have been dead but by the efforts of the Rubensians. Through his Flamen the school of painting was kept pure and his pure fancy as the "Garden of Love" (Dorchester and in Vianden), the "Elephant" (Berlin), and the "Village Feast" (Louvre), have never been equalled.

RUBIACEAE—RUBIDIUM

808

RUBIACEAE, in botany, a large natural order of seed plants, belonging to the series Rubiales of the subclass Sympetalae (Gamopetalae) of Dicotyledons, and containing about 350 genera with about 4500 species. It is mainly a tropical family of trees, shrubs and herbs, but some of the tribes, especially Galiceae, to which the British representatives belong and which contains only herbs, are more strongly developed in temperate regions; some species of Galium reach the Arctic zone and are found at high elevations on mountains in the tropics.

The most striking characteristic of the family are the opposite-decussate, generally entire, stipulate leaves. The stipules are very varied in form; they generally stand between the petioles of a pair of leaves (interpetiolar). The two stipules of adjacent leaves are usually united, and in the Galineae, as well shown in the British species, are enlarged and leaf-like, forming with the two leaves an apparent whorl; by fusion or branching of the stipules the number of leaves in the whorl varies from four to eight or more. The flowers are rarely solitary, terminal or axillary, as in Gardenia; generally they are arranged in cymes or panicles or crowded into heads, and are often showy; in British members of the family they are very small, but may be conspicuous from their numbers, as in lady's bedstraw (Galium verum). The flowers are hermaphrodite and regular with parts in fours or fives; the four or five sepals, petals and stamens are placed above the ovary, which consists of two carpels, contains one to indeterminate anatropous ovules in each of the two chambers, and is crowned by a simple style ending in a head or in two lobes. The petals are often small, sometimes reduced to a narrow ring encircling the top of the ovary or altogether absent. The united petals form a corolla which varies widely in form in the different genera; it is often funnel- or salver-shaped, the tube, which is secretory, is prolonged in a disk round the base of the style, being at the bottom of a longer or shorter tube, in which the flowers are adapted for pollination by Lepidoptera or bees, as in Gardenia, Mussaenda, Guettarda, &c.; in other cases it is bell-shaped or, as in Galium, rotate with a short tube and sharply spreading segments; the tube is in these cases freely exposed or only slightly concealed and the flowers are pollinated by flies. The stamens are attached to the corolla-tube and alternate in position with its segments; the anthers are often dimorphic (or heterostyled) with short-styled and long-styled forms as in Ipecacuanha (see fig.).

The fruit varies widely in form and is dry or fleshy. When dry it forms a capsule with septical or loculical dehiscence, or is a schizocarp separating when dry into two or more seeded mericarps which are as a rule in the British character (Galium pumilum), sometimes bear hooked appendages which aid their dispersal. Some genera show a remarkable association with ants. Thus Myrmecodia, Hydrophyllum are epiphytic plants, in which the base of the plant is a stock of slender herbaceous shoots, sometimes provided with numerous adventitious roots. The species of the tuber is penetrates by numerous cork-lined cavities communicating by galleries, which are inhabited by ants. There is no evidence that the presence of the ants is of any service to the plant.

The order is divided into a large number of tribes based on the number of ovules in each ovary-chamber, the character of the fruit seed and ovule, and the aestivation of the corolla. These may be arranged as follows:

Cinchoneae, often woody plants with scale-like stipules, and numerous ovules in each ovary-chamber; the fruit is generally a capsule. To this belong Cinchona (q.v.), a genus of large trees with handsome bark, also containing about forty species in the Old World tropics and South America—it is well-known as the source of Peruvian bark. An allied genus, Bombax (q.v.), from tropical America, is cultivated for its flowers. The species of Uncaria clime by means of hooks which are modified inflorescence-rays.

Musaeanea, Gardenia (q.v.), and other genera are characterized by having a fleshy fruit.

Coffeeae, often woody or shrubby plants with scale-like stipules; each ovary-chamber contains only one ovule. Coffee (q.v.), a genus of about twenty-five species in the Old World tropics, includes the coffee plant (C. arabica and C. liberica); the fruit is a two-seeded drupe, the seed is the "coffee-bean." The thickened root of Uragoga ipecacuanha yields ipecacuanha (q.v.).

Solanaceae, a large herbaceous family, includes the potato, the potato plant (Solanum tuberosum), which is cultivated for its tubers; each ovary-chamber contains one ovule only. Contains the four British genera Rubia, one species of which, R. tinctorum, is madder; Galium, including G. verum (lady's bedstraw), G. Aparine (goose-grass or \( \text{Rb, atomic weight: } 85-45 \quad (0 = 16) \), a metallic element belonging to the group of the alkali metals. It is found in the minerals lepidolite, petalite and in various specimens of mica and of carnallite, and in some mineral waters. It also occurs in tea, cocoa, coffee, tobacco and in the ashes of beetroot. It was discovered by R. Bunsen and Kirchhoff (Ann., 1860, 113, p. 337), in the spectroscopic examination of the residues obtained on evaporation of water from a mineral spring at Dürkheim, being characterized by two distinctive red lines. The best source of rubidium salts is the residue left after extracting lithium salts from lepidolite, the method of separation being based on the different solubilities of the platinocludes of potassium, rubidium and caesium

Ipecacuanha Plant.

RUBICON, a small stream of ancient Italy, which flowed into the Adriatic between Ariminum and Caesena, and formed the boundary between Italy and the province of Cisalpine Gaul. Hence Caesar's crossing of it in 49 B.C. was tantamount to a declaration of war against Rome as represented by Pompey and the Senate. The historic importance of this event gave rise to the phrase "crossing the Rubicon" for a step which definitely commits a person to a given course of action. There has been much controversy as to the identification of the stream; it appears that its upper course is represented by that of the Fisceltello (called Rubigio in the 11th or 12th century, and now Rugone or Urgone), and its lower portion by the Fiumicino, which the Urgone once joined. The point was marked by a station on the Via Aemilia, below their confluence, 12 m. N.W. of Ariminum, bearing the name ad Confuentibus; and here is still preserved a three-arched bridge, larger than is necessary for the water carried by the present Fiumicino.
in water (R. Bunsen, *Ann.*, 1862, 122, p. 351). A somewhat similar process based on the varying solubilities of the corresponding metal halides has also been devised by Redtenbacher (*Jour. prak. Chem.*, 1865, 95, p. 148). The metal is prepared by distilling the carbonate with carbon (an explosive compound similar to that obtained from potassium and carbon monoxide is liable to be formed simultaneously); by reducing the hydroxide with aluminium: 4RbOH + 2Al = Rb₂O Al₂O₃ + 2Rb + H₂ (N. Beketoff, *Ber.*, 1888, 21, p. 424 ref.); by reducing the carbonate (C. Winckler, *Ber.*, 1890, 23, p. 51) or the hydroxide with magnesium (H. Erdmann and P. Köthner, *Ann.*, 1889, 294, p. 55); and by heating the fused chloride with calcium in an exhausted glass tube at 400–500° C. (L. Hackspill, *Comptes rendus*, 1903, 141, p. 101). The metal was first obtained electrolytically in 1910 by electrolyzing the fused hydroxide in a nickel vessel, with an iron wire cathode and iron cylinder anode; the product on cooling being opened under pyridine cooled by a freezing mixture (G. von Hevesy, *Zeit. anorg. Chem.*, 1910, 67, p. 241). It is a silvery white metal which melts at 39.5° C. and has a specific gravity of 1.52. It oxidizes in dry air and decreases cold water very rapidly. It closely resembles caesium and potassium in its general properties. The rubidium salts are generally colourless, mostly soluble in water and isomorphous with the corresponding potassium salts. Rubidium hydride, RbH, was obtained in the form of colourless needles by H. Moissan (*Comptes rendus*, 1903, 136, p. 587) from the direct combination of its constituent elements. It rapidly dissociates when heated in vacuo to 300° C. The existence of the oxide Rb₂O appears to be doubtful, the results of Erdmann and Köthner (loc. cit.) pointing to the formation of Rb₂O by the direct union of the metal with dry oxygen. E. Rengade (*Comptes rendus*, 1907, 144, p. 920), by partially oxidizing the metal in a current of dry oxygen and distilling the excess of oxygen, described a white solid which has obtained oxides of composition Rb₂O (yellowish white), Rb₂O₂ (black) and RbO₂ (yellow). Rubidium hydroxide, RbOH, is a colourless solid which is formed by the action of rubidium on water, or by the action of an alkaline solution on hydroxylate. It is readily soluble in water, the solution being very alkaline and caustic. It melts at 301°. Evaporation of the aqueous solution at 15° C. deposits a crystalline hydrated hydroxide of composition RbOH·2H₂O (R. de Fourcart, *Comptes rendus*, 1909, 149, p. 1377). Rubidium chloride, RbCl, is formed on burning rubidium in chlorine, or on dissolving the hydroxide in aqueous hydrochloric acid. It crystallizes in colourless cubes and volatilizes when heated very strongly. When heated with water it forms chlorides which fuse to form double salts. It combines also with iodine chloride and bromide and with bromine chloride and with bromine (H. L. Wells and H. L. Wheeler, *Amer. Jour. Sci.*, 1891 (3) 43. p. 470). Rubidium sulphate, Rb₂SO₄, is formed by the action of sulphuric acid on the carbonate or hydroxide of the metal, or by the action of milk of lime on rubidium alum, the excess of lime being precipitated as hydroxide of rubidium and the solution neutralized by sulphuric acid. It forms large colourless hexagonal crystals. Several sulphides of the metal have been described by W. Blötz and E. Wilke-Dörfurt (*Zeit. anorg. Chem.*, 1906, 48, p. 297). The normal sulphide, Rb₂S₄H₂O, is colourless, and when heated in aqueous solution it is hydrolysed with the liberation of ammonia into the yellow tetrasulphide, Rb₂S₄·2H₂O. A pentasulphide, Rb₂S₅, which crystallizes in red prisms melting at 233° C., is also obtained by the direct union of the normal sulphide with sulphur. When heated in a vacuum of hydrogen it yields the red tetroxide, Rb₂S₄·2H₂O. These sulphides are much less hygroscopic than the corresponding caesium compound. Rubidium nitrate, RbNO₃, was obtained by heating the nitric acid on the carbonate, crystallizes in needles or prisms and when strongly heated is transformed into a mixture of nitric oxide and oxide. Rubidium ammonium, RbNH₄, was prepared by H. Mühlbauer (*Comptes rendus*, 1905, 140, p. 1032). It has a high ammonia value on rubidium. The product combines with acetylene to form rubidium acetylide acetylene, RbC₂₂H₂, which on heating in vacuo loses acetylene and leaves a residue of rubidium carbide Rb₂C. When heated with water the acetylene is split off and RbCO₃ is formed, the addition of ammonium carbonate to rubidium hydroxide is a crystalline mass which melts in its water of crystallization when heated.

The atomic weight of rubidium was determined by R. Bunsen (*Pogg. Ann.*, 1861, 113, p. 339), Picard (*Zeit. ges. Chem.*, 1862, 1, p. 519) and Godefroy (*Ann.*, 1876, 181, p. 185), the methods being based on the conversion of rubidium halides into the corresponding silver salt, and the values obtained vary from 85.40 to 85.50. The determination of E. H. Archibald (*Jour. Chem. Soc.*, 1904, 85, p. 776) from the analysis of the chloride and bromide gives the mean value as 85.48 (O = 16).

**RUBINSTEIN, ANTON GRIGOROVICH** (1829-1894), Russian pianist, bori of Jewish parentage on the 29th of November 1829 at Wechwotyinetz, in Podolia, was the son of a pencil manufacturer who migrated to Moscow. The Rubinstein family, at the dictate of Anton's grandfather Roman Rubinstein, had all been baptized at the time of the ukase against the Jews issued in 1830 by the Tsar Nicholas. Anton was then one year old. Besides his mother he had but one teacher, the piano master Alexander Villoing, of whom he declared at the end of his own career that he had never met a better. In July 1838 Rubinstein appeared in the theatre of the Petrovski Park at Moscow; and in the year following he went to Paris after Villoing, and in 1840 played before Lissz. For some time after this Rubinstein travelled in Holland, Germany and Scandinavia, and reached England in 1842, where on the 20th of May he made his first appearance at a Choral Fund concert. In 1845, after a brief visit to Moscow in 1843, he went with his family (including his brother Nikolaus) to Berlin in order to complete his musical education. Dehn was their master, and Mendelssohn, whom Rubinstein had met previously in London, their best friend. The sudden death of Rubinstein's father necessitated the withdrawal of his mother and Nikolaus to Moscow, while Anton, on Dehn's advice, went to Vienna to seek a livelihood. Hence, after more hard study for nearly two years, he went with the flautist Heindl, and later alone, on a concert tour in Hungary; and the outbreak of the revolution in Vienna preventing his return there, he went via Berlin to St Petersburg, where the Grand Duchess Hélène appointed him Kammermusikus. About this time an unfortunate error of the police nearly caused his expatriation to Siberia, from which he was saved by his patroness. During the next eight years Rubinstein spent most of his time in St Petersburg studying, playing and composing. His opera *Dmitri Donskoi* was produced there in 1857 and *Toms der Narr* in 1853. *Die Silbischen Jäger*, written about the same time, was not produced. On the advice of his patroness and Count Willhorski he visited Hamburg and Leipzig, and arrived for the second time in London in 1857, when at a Philharmonic concert he introduced his own concerto in G. In the following year he was in London again, having in the meantime been appointed Concert Director of the Royal Russian Musical Society. In 1862, in collaboration with Carl Schubert, he founded the St Petersburg Conservatorium, of which he was director until 1867. In 1868 he travelled in Germany, France and England, and remained for some time in Vienna, where he introduced a large number of his own compositions. Thence he went to America in 1872 and 1873, when he returned to Russia, and after a short rest set off once more on concert tours. In this manner the rest of his life was spent, until in 1895 he began a series of historical recitals of his own compositions, which interest made him the chief European capitals. He died on the 20th of November 1894.

In addition to the works already named, Rubinstein left compositions in almost every known form. Among other of his operas are *Die Kinder der Haide, Feramos* (Lolla Roukh), *Nero, Der Dumon und Die Makkabäer*, this last perhaps more frequently played than all the others, of which the chief defect is their lack of dramatic point. On the subject of oratorio Rubinstein held original views, though his attempt to realize them in *Moses* and *Christus* was not completely successful, while his efforts in Berlin and London to found a Sacred Theatre failed entirely. Nevertheless he himself regarded the *Christus* as his greatest achievement. The most familiar of his five symphonies are the "Ocean" and the "Dramatic." He wrote scores on scores of pianoforte works, from complex concertos to the most commonplace salonstücke; abundance of concerted chamber-music, and a number of songs and duets, which enjoyed some popularity. He also published several books, including his *Reminiscences* and *Die geistliche Opera*.
Rubinstein’s fame as one of the greatest of pianists will live in history. His technique bore comparison with that of Liszt; he possessed a power for interpreting the most different kinds of music which has not been surpassed.

His brother Nikolaus (1835-1881) was also a remarkable pianist, and a marvellous teacher of music. He founded the conservatorium of music at Moscow.

RUBRIC (Fr. rubrique, Lat. rubrica, ruber, red), in its earliest and original sense, red earth or ochre, reddish, and hence applied to words written or printed in red lettering, in MSS. or printed books, such as chapter headings, paragraphs, initial letters, &c., thus marking in a distinctive manner that to which attention is to be drawn. The term was also applied to the passages so marked, and more especially to the directions or rules as to the conduct of divine service in liturgical books. This is the chief current usage of the term (see Liturgy).

RUBRUIS (or Rubrouck), WILLIAM OF (c. 1215-1270; fl. 1253-55), Franciscan friar, one of the chief medieval travellers and travel-writers. Nothing is known of him save what can be gathered from his own narrative, and from Roger Bacon, his contemporary and brother Franciscan. The name of Rubruquis ("Fratis Willielmi de Rubruquis") is found in the imperfect MS. printed by Hakluyt in his collection, and followed in his English translation, as well as in the complete issue of the English by Purchas. Writers of the 16th, 17th, and 18th centuries have called the traveller Rusbroccke and Rysbroeckus (Rysbroeck and Ruysbroeck in the Biographie universelle and Nouv. biog. générale)—an error founded on the identification of his name of origin with Ruysbroeck in Brabant (a few miles south of Brussels) and perhaps promoted by the fame of John of Ruysbroeck or Rysbroeck (1294-1381), a Belgian mystic, whose treatises have been reprinted as late as 1848. It is only within the last twenty years that attention has been called to the fact that Rubruck is the name of a village and commune in old (medieval) French Flanders, belonging to the canton of Cassel in the department du Nord, and lying some 8 m. N.E. of St Omer. In the library of the latter city many medieval documents exist referring expressly to de Rubrucks 1 of the 12th and 13th centuries. It may be fairly assumed that Friar William came from this place; 2 thus Hakluyt’s conclusion is justified, as expressed in the title he gives to Lord Lumley’s MS. printed by him, now in the British Museum, MSS. Reg. 14 C. xii. fol. 225 r.-30 r. (Itinerarium fratis Willielmi de Rubruquis de ordine fratrum Minorum, Galli, Ann. gratie 1253, ad partes Orientales).

Friar William went to Tartary under orders from Louis IX. (St Louis). That king, at an earlier date, viz. December 1248, when in Cyprus, had been visited by alleged envoys from Edessa (Ilchikadai), and those envoys had recommended the tonogor hosts in Armenia and Persia. The king then despatched a return mission consisting of Friar Andrew of Longjumeau or Longjumel and other ecclesiastics, who carried presents and letters for both Ilchikadai and the Great Khan. They reached the court of the latter in the winter of 1249-50, when there was no actual khan on the throne; and they returned, along with Tatar envoys, bearing a letter to Louis from the Mongol regent-mother which was couched in terms so arrogant that the khan repented sorely of having sent such a mission ("Il roia se repenti fort quant il y envoya," Jovinus, Histoire de Saint Louis, pp. 148-49, in Paris edition of 1558 by F. Michel, Paulin Paris et F. Ribot). The second envoys reached the khan when he was at Caesarea, therefore between March 1251 and May 1252. But not long after the khan, hearing that the Tatar prince Sartak, son of Batu, was a "baptized Christian," felt moved to open communication with him, and for this purpose deputed Friar William of Rubruck. The former reab had made the khan chary of sending formal embassies, and Friar William on every occasion, beginning with a sermon delivered in St Sophia’s on Palm Sunday (i.e. April 13th) 1253, disclaimed that character.

Various histories of St Louis, and other documents, give particulars of the dispatch of the mission of Friar Andrew from Cyprus, but none mention that of Friar William, and the first dates given by the latter are those of his sermon at Constantinople, and of his entrance into the Black Sea (May 7th, 1253). He must therefore have received his commission at Acre, where the khan was residing from May 1252 to the 20th of June 1253; but he had travelled by way of Constantinople, as has just been indicated, and therefore letters to some of the Tatar chiefs from the emperor, who was at this time Baldwin de Courtenay, the last of the Latin dynasty.

The narrative of the journey is everywhere full of life and interest. The vast conquests of Jenghiz Khan were still in nominal dependence on his successors, at this time represented by Mangu Khan, reigning on the Mongolian steppes, but practically these conquests were splitting up into several great monarchies. Of these the Ulus of Juji, the eldest son of Jenghiz, formed the most westerly, and its ruler was Batu Khan, established on the Volga. Sartak is known in the history of the Mongols as Batu’s eldest son, and was appointed his successor, though he died immediately after his father (1256). The story of Sartak’s Christianity seems to have had some foundation; it was currently believed among Asiatic Christians, and it is alleged by Armenian writers that he had been brought up and baptized among the Russians. Pope Innocent IV (August 20, 1254) refers with enthusiasm to Sartak’s baptism, of which he had just heard from a priest whom the khan had sent as envoy to the papal court.

Rubruck and his party landed at Soldaia, or Sudak, on the Crimean coast, then a centre of intercourse between the Mediterranean world and what is now S. Russia. Equipped with horses and carts for the steppe, they travelled successively to the courts (i.e. the nomad camps) of Scacatai (Kadahn?), Sartak and Batu, thus crossing the Don and arriving at the Volga: of both these rivers Friar William gives vivid and interesting sketches. Batu kept the travellers for some time in suspense, and then referred them to the Great Khan himself, an order involving the enormous journey to Mongolia. The actual travelling of the party from the Crimea to the khan’s court near Karakorum cannot have been, on a rough calculation, less than 5000 m., and the return journey to Lajazzo (or Cilicia) would require by 500 to 700 m. The chief dates to be gathered from the narrative are as follows: the envoys embark on the "Exuine," May 7th, 1253; reach Soldaia, May 21st; set out thence, June 1st; reach the camp of Sartak, July 31st; begin the journey from the camp of Batu E. across the steppes, September 16th; turn S.E., November 1st; reach the Talas river, November 8th; leave Cailac 3 (S. of Lake Balkash), November 30th; reach the camp of the Great Khan, December 27th; leave the camp of the Great Khan on or about July 10th, 1254; reach camp of Batu again, September 16th; leave Batu’s camp at Sarai, November 1st; arrive at the Iron Gate (Derbent), November 13th; Christmas spent at Nakhshivan or Nakhichevan (under Ararat); reach Antioch (from Lajazzo, Layes, or Ayas, of Cilicia, via Cyprus), June 20th, 1255; reach Tripoli, August 15th.

1 Cailac, where Rubruck halted twelve days, is undoubtedly the Yayilik of the historians of the Mongols, the position of which is somewhat indefinite. The narrative of Rubruck shows that it must have been near the modern Kopal.
The camp of _latu_ was first reached near the northernmost point of his summer marches, therefore about Ukek or Uyvex, near Saratov (see Marco Polo, Paris ed. of 1824, p. 3). Before the camp he left they had marched within five days' journey from the Volga. The point of departure would lie on that river somewhere between 52° and 50° N. The route taken lay E. by a line running N. of the Caspian and Aral basins; then from about 70° E. to the basin of the Talas river; thence across the passes of the Kirghiz Ala-tau and S. of the Balkash Lake to the Ala-kul and the Baratula Mountains (Ebi-nor). From this the travellers struck N. across the Barlk, or the Orkochuk Mountains, and thence, passing S. of the modern Koldo, to the valley of the Jabkkan river, whence they emerged on the plain of Mongolia, coming upon the Great Khan's camp at a spot ten days' journey from Karakorum and lying in the main S. from that place, with the Khangai Mountains between.

This route is of course not thus defined in the narrative, but is a deduction from the facts stated therein. The key to the whole is the description given of that central portion inter-vening between the basin of the Talas and Lake Ala-kul, which enables the topography of that region, including the passage of the II, the plains S. of the Balkash, and the Ala-kul itself, to be identified past question.¹

The return journey, being made in summer, after retraversing the Jabkkan valley, lay apparently farther to the N., and passed through regions, probably with a fairly straight course, to the mouths of the Volga. Thence the party travelled S. by Derbent, and so by Shamakhi to the Araxes, Nakhshivan, Erzinger, Sivas and Iconium, to Lajazzo, Layas, or Ayas, where they embarked for Cyprus and Syria. St Louis had returned to France a year before.

We have alluded to Roger Bacon's mention of Friar William. Indeed, in the geographical section of the _Opus Majus_ (c. 1262) he cites the traveller repeatedly and copiously, describing him as "frater Wilhelmus quem dominus rex Franciee mist ad Tartarum, Annum 1258, anno vero quod ibi data est, S. M.setTimeout(1980,5623,19987,5623)" (see _Opus Majus_, Oxford edition of 1897, i. 353-60). Add to this William's own individual particulars as to his being-like his predecessor, Friar John de Plano Carpini—a very heavy man (_ponderosus salubre_), and we know no more of his personality, except the abundant indications of character afforded by the story itself. These paint for us an honest, pious, stout-hearted, acute and observant, but obstinate and obstreperous as he was with his fellow-travellers, the author of one of the best narratives of travel in existence. His language indeed is dog-Latin of the most un-clerical quality; but it is in his hands a pithy and transparent medium of expression. In spite of all the difficulties incident to transferring such a quiver of happy and sympathetic comments, the author of the _Itinerarium_ is a master and diplomatist to Carpin; and the latter's remarkable work has in its turn suffered from indiscriminate eulogy of his successor's _Itinerarium_. An attempt has been made to strike a balance in the judgment of these two great pioneers in the _Dawn of Modern Geography_.²

The narrative of Rubrouck, after Roger Bacon's copious use of it, seems to have dropped out of sight, though five MSS. are still known to exist: the chief of these are (1) Corp. Chr. Coll. Cambridge, No. 1800: 110 v. of about 1300; (2) No. 181 of the same library, fol. 312-98, of about 1270-90; (3) Leiden Univ. Libr., No. 77 (formerly 104), fols. 160 r.—190 r. of about 1290. It has no place in the famous collections of the 14th century, nor in the earlier Hakluyt, Schuyler's _Turkish_ and _Voyages_. The only _Histoire litteraire et motardes_ that shows any interest of this period was published by Dr. William W. Rockhill (London, 1900); (ii.) _Texts and Versions of Carpinii_.

In the _Recueil de Voyages_ of the Paris Geographical Society, vol. iv., contained an edition of the Latin text, and a collation of the MSS. put forth by M. d'Avezac, with the assistance of two young scholars, since of high distinction, viz. Francisc Mihel and Thomas Wright. There is no commentary on the subject-matter, such as M. d'Avezac attached to his edition of Friar John de Plano Carpini in the same volume. Something has been done to supply this deficiency by the two editions in the Hakluyt Society's publications, (i.) _William of Rubrouck: John of Plano Carpinii_, trans. and edited by William W. Rockhill (London, 1900); (ii.) _Texts and Versions of Carpinii and Rubrouck_.

¹ See details in _Cathay and the Way Thither_, pp. ccxi-ccxiv, and Schuyler's _Turkistan_, i. 402-5. Mr Schuyler points out the true identification of Rubrouck's river with the II, instead of the Chu, which is a much smaller stream; and other alterations have been decreed by Dr F. M. Schmidt of the _Baltisches._²

³ This meaning may be put on Rubrouck's words: "Our going was in winter, our return in summer, and that by a way lying very much farther north, only that for a space of fifteen days' journey in going and coming there was no grass to be found except close to the river." The position of the Chagan Takoi or upper Jabkkan seems to suit these facts best; but Mr Schuyler refers them to the upper Irtysh, and Dr F. M. Schmidt to the Ulungr.

⁴ It is a periphrastic, or incoercibly intelligible, idiom, quando dicebam unum ipse totum alius diebat, secundum quod ei occurrerat. Tum videns eritum loquendi per ipsum, elegi magis tacere (249-49).

The passage in the text is to _d'Avezac's_ edition of the Latin (see below).
RUBY

(Lat. rubes, red), the most valued of all gem-stones, a red transparent variety of corundum, or crystallized alumina. It is sometimes termed “oriental ruby” to distinguish it from the spinel ruby, which is a stone of inferior hardness, density and value (see SPINEL). When the word ruby is used without any qualifying prefix, it is always the true or so-called criental stone that is meant in modern nomenclature. Ancient writers, relying chiefly on colour, classed together under a common name several brilliant red stones, such as the ruby, spinel and garnet: thus the ἀνάπτης of Theophrastus and the Carbunculus of Pliny were names which seem to have been applied to several distinct minerals. Although the word ruby is used in the English translation of the Old Testament it is improbable that the ancients knew the Burmese stone.

The ruby crystallizes in the hexagonal system (see CORUNDUM). The crystals have no true cleavage, but tend to break along certain gliding planes. The colour of ruby varies from deep cochineal to pale rose-red, in some cases with a tinge of purple, the most valued tint being that called by experts pigeon’s-blood colour. On exposure to a high temperature, the ruby becomes green, but regains its original colour on cooling. The red colour of ruby may be due to chromium. When a ruby of the most esteemed tint is examined with the dichroscope, one image is generally seen to be carmine and the other aurora-red, the red colour inclining to orange. This test serves to distinguish the true ruby from spinel and from garnet, since these minerals, being cubic, are not dichroic. Another means of distinction is afforded by the specific gravity of ruby (about 4), which is higher than that of spinel and garnet, whilst the superior hardness of the ruby (about 9) furnishes yet another test. The high refractivity of ruby is also characteristic, the mean ordinary index being 1·77 and the extraordinary 1·76. When cut and polished the ruby is therefore a brilliant stone, but having weak dispersive power it lacks fire. Subjected to radiant discharge in a Crookes tube, the ruby, like other forms of corundum, phosphoresces with a vivid red glow.

The oriental ruby is a mineral of very limited distribution. Its most famous localities are in Upper Burma, but until the British annexation of the country in 1886 the mines were so jealously guarded that little was known as to the conditions under which the mineral occurred. Soon after the annexation, the ruby districts were officially visited, and reported on, by Mr C. Barrington Brown, and specimens from the mines were exhaustively studied by Professor J. W. Judd. The principal district is situated in the neighbourhood of Mogok, 90 m. N.N.E. of Mandalay. The ruby occurs in bands of a crystalline limestone, associated with granitic and gneissose rocks, some of which are highly basic; and it is from the anorthite, or limpetic, metamorphic rocks that the mineral is generally derived. The gneisses, that the corundum, spinel and calcite, may, according to Judd, have been derived. Probably the felspar is first altered to scapolite, and this on decomposition would yield calcium carbonate and hydrous aluminium silicates, from which the anhydrous aluminia might ultimately be separated. The limestone contains (in addition to the ruby) spinel, garnet, graphite, wollastonite, scapolite, felspar, mica, pyrophytite and other minerals. The ruby, like other kinds of corundum, suffers alteration under certain conditions, and passes by hydration into gibbsite and diasporo, which by further alteration and union with silica, &c., may yield margarite, vermiculite, chlorite and other hydrous silicates.

The Burmese rubies are not generally worked in the limestone matrix, but are mostly found loose in detrital matter, which is clayey and sandy in character and yellowish-brown in colour, and is known locally as "byon." Some of the deposits occur in limestone caverns, where they may, like cave-earth, represent the insoluble residue of the limestone. Workings in the cave-deposits are called “lodowins” (crooked mines). In the alluvium of the valleys, the ruby-pits are known as "twilones" (round pits), whilst workings in the ruby-earth on the hillsides are termed "hmayaudwins" (water mines). The byon contains, with the ruby, other coloured corundums and spinels. Burmese rubies are found also in crystalline limestone in the hills near Sagyin, about 20 m. N. of Mandalay, and it is of mineralogical interest to note that the limestone here contains chondrodite.

Rubies are found in Siam, at several localities in the provinces of Chantabun and Krat; and Professor H. Louis has described their occurrence at Moung Klung in this region. The rubies are found with sapphires and spinels, in gravels, resting in some cases on basic igneous rocks. The Siam rubies are generally of dark colour, often inclining to a deep reddish brown. Rubies occur, with sapphires and other minerals, in the gem-gravels of Ceylon, but are not usually of such good quality as the Burmese stones. A cloudy variety, which, when cut with a convex surface, exhibits a luminescent star, is known as star-ruby (see ASTERIAS). In peninsular India rubies are rarely found, though they have been reported from the corundum deposits of Madras and Mysore. The ruby is known, however, to occur in a micaceous limestone at Jagdalak, near Kabul in Afghanistan.

Rubies, generally of pale colour, are found with the sapphires of Montana, especially at Yogo Gulch near Utica. In the corundum deposits of N. Carolina ruby is occasionally met with, especially at Cowee Creek, Macon county, where it occurs in crystals of tabular, rhombohedral and prismatic habit. These crystals, sometimes of fine colour, are found in gravels resting on a soft rock called saprolite, which results from the weathering of certain basic igneous rocks; and it is notable that the ruby crystals are associated with the variety of garnet termed rhodolite, as described by Professor Judd and W. E. Hiddon. Australia has occasionally yielded rubies, but mostly small size and inferior quality. In New South Wales and in Victoria they have been found in drift gravels, and a magenta-coloured turbid variety from Victoria has been described under the name of barklyte.

Rubies have been produced artificially with much success. At one time it was the practice to fuse together small fragments of the natural stone; and gems cut from such material were known as reconstructed rubies. This process has given way to Professor A. Verneuil’s method of forming artificial ruby from purified ammonia-alum with a certain proportion of chromalum. The finely powdered material is caused to fall periodically into an oxyhydrogen flame, the heat of which decomposes the alum, and the alumina thus set free forms liquid drops which collect and solidify as a pear-shaped mass. When of the characteristic pigeon’s-blood colour, the synthetic ruby contains about 2·5% of chromic oxide. The manufactured ruby possesses the physical characters of corundum, but may generally be distinguished by microscopic bubbles and strie. Artificial rubies are manufactured both for scientific and commercial purposes.

BIBLIOGRAPHY.—For the Burmese ruby, see “The Rubies of Burma and Associated Minerals: their mode of occurrence, origin and metamorphoses,” by C. Barrington Brown and Professor J. W. Judd, Phil. Trans., 1897, 187, p. 151. For the ruby of Siam, see the “The Ruby and Sapphire Deposits of Moung Klung, Siam,” by H. Louis, Mineralog. Mag., 1894, 10, p. 267. For synthetic ruby, the
RUBY MINES—RUDD

813

(F. W. R.*

RUBY MINES, a district in the Mandalay division of Upper Burma, lying along the Irrawaddy river between the Bhamo district on the N., the Shan States on the E., Mandalay district on the S. and Katha on the W. Including the Shan state of Mogint, which is temporarily administered as part of the district, the total area is 5476 sq. m.; pop. (1901) 87,694. The district geographically forms part of the Shan plateau, and is to a great extent a mass of hills with a general N. and S. direction. It contains considerables numbers of Kachins (13,300) and Palaungs (16,400). The annual rainfall at Mogok averages 98 in. The administrative headquarters are at Mogok, which is also the centre of the ruby-mining industry. It stands in the centre of a valley 4000 ft. above sea-level, and is reached by a cart-road from Thableikkyin, 56 m. distant, on the Irrawaddy. The Ruby Mines Company employs about 44 Europeans and Eurasians in its works, which are situated at the north end of the town. The company has constructed a dam across the Yeni stream and set up an electric installation of about 450 horse-power, which works pumps and the washing machinery. The mine was located under Burmese rule, but were discontinued on account of the small profits. Now seem to be established on a sound financial basis. The system adopted is to excavate large open pits, from which the ruby-earth or byon is removed en masse and washed and crushed by machinery. Spinels and sapphires are found with the rubies. In 1904, the produce of rubies alone was 200,000 carats, valued at £80,000, most of which were sent to London for sale. In addition, some mining is carried on by natives, working under a licence which does not permit the use of machinery. The district contains 914 sq. m. of reserved forests.

RÜCKERT, JOHANN MICHAEL FRIEDRICH (1788–1866), German poet, was born at Schweinfurt on the 16th of May 1788, the eldest son of a lawyer. He was educated at the gymnasium of his native place and at the universities of Würzburg and Heidelberg. For some time (1816–17) he worked on the editorial staff of the Morgenblatt at Stuttgart. Nearly the whole of the year 1818 he spent in Rome, and afterwards he lived for several years at Coburg. He was appointed a professor of Oriental languages at the university of Erlangen in 1826, and in 1841 he was called to a similar position in Berlin, where he was also a privy councillor. In 1849 he resigned his professorship at Berlin, and went to live on his estate Neuses near Coburg. He died on the 31st of January 1866. When Rückert began his literary career, Germany was engaged in her life-and-death struggle with Napoleon; and in his first volume, Deutsche Gedichte, published in 1814 under the pseudonym "Freimund Raimar," he gave, particularly in the powerful "Geharnischte Sonette," vigorous expression to the prevailing sentiment of his countrymen. In 1815–18 appeared Napoleon, eine politische Komödie in drei Stücken (only two parts were published), and in 1817 Der Kranz der Zeit. He issued a collection of poems, Östliche Rosen, in 1822; and in 1834–38 his Gesammelte Gedichte were published in six volumes, a selection from which has passed through many editions. Rückert, who was master of thirty languages, made his mark chiefly as a translator of Oriental poetry and as a writer of poems conceived in the spirit of Oriental masters. Much attention was attracted by a translation of Hariri's Mahomet (1836), Nal und Damwon, an Indian tale (1838), Rosen und Subrah, eine Heldengeschichte (1838), and Hamza oder die ältesten arabischen Volkslieder (1846). Among his original writings dealing with Oriental subjects are Morgenländische Sagen und Geschichten (1837), Erbauliches und Beschauliches aus dem Morgenland (1836–38), and Brahmanische Erzählungen (1839). The most elaborate of his works is Die Weisheit des Brahmanen, published in six volumes in 1836–39. This last and the Liebesfrühlings (1844), a cycle of love-songs, are the best known of all Rückert's productions. In 1845–46 he issued the dramas Saul und Davi (1845). Herodes der Grosse (1844), Kaiser Heinrich IV. (1845) and Christoforo Colombo (1845), all of which are greatly inferior to the work to which he owes his place in German literature. At the time of the Danish war in 1864 he wrote Ein dauerndes Kanüle für Schiesseholz, which, although published anonymously, produced a considerable impression. After his death many poetical translations and original poems were found among his papers, and several collections of them were published. Rückert had a splendid imagination which made Oriental poetry congenial to him, and he has seldom been surpassed in rhythmic skill and metrical ingenuity. There are hardly any lyrical forms which are not represented among his works, and in all of them he wrote with equal ease and grace.

A complete edition of Rückert's poetical works appeared in 12 vols. in 1868–69. Subsequent editions have been edited by L. Laistner (1866), C. Beyer (1896), G. Ellinger (1897). See: B. Fortlage, F. Rückert und seine Werke (1867); C. Beyer, Friedrich Rückert, ein biographisches Denkmal (1868), Neue Mitteilungen über Rückert (1873), and Nachgelassene Gedichte Rückerts und neue Beiträge zu dessen Leben und Schriften (1877); R. Bobergen, Rückert-Studien (1878); P. de Larder, Erinnerungen an F. Rückert (1886); F. Muncker, Friedrich Rückert (1890); G. Voigt, Rückerts Gedankenlyrik (1891).

RÜDAGI (d. 934). Farid-eddin Mahommeh 'Abdallah, the first great literary genius of modern Persia, was born in Rüdagi, a village in Transoxiana, about 870–900. Most of his biographers assert that he was totally blind, but the accurate knowledge of colours shown in his poems makes this very doubtful. The fame of his accomplishments reached the ear of the Sāmānid Nāsr II. bin Ahmad, the ruler of Khorāsān and Transoxiana (925–934), who invited him to the court. Rüdagi became his daily companion, rose to the highest position and amassed great wealth. In spite of various predecessors, he well deserves the title of "father of Persian literature," the "Adam or Sultan of poets," since he was the first who impressed upon every form of epic, lyric and didactic poetry its peculiar stamp and its individual character. He is also said to have been the founder of the "diwan"—that is, the typical form of the complete collection of a poet's lyrical compositions in a more or less alphabetical order which prevails to the present day among all Mahommnedan writers. Of the 1,300,000 verses attributed to him, there remain only 52 kashidas, ghazals and rubā'is; of his epic masterpieces we have nothing beyond a few stray lines in native dictionaries. But the most serious loss is that of his translation of Ibn Mokaffa's Arabic version of the old Indian fable book Kalilah and Dimnah, which he put into Persian verse at the request of his royal patron. Numerous fragments, however, are preserved in the Persian lexicon of Asadi of Tus (ed. P. Horn, Göttingen, 1857). In his kashidas, all devoted to the praise of his sovereign and friend, Rüdagi has left us unthralled models of a refined and delicate taste, very different from the often bombastic compositions of later Persian encomiasts. His didactic odes and epigrams express in well-measured lines a sort of Epicurean philosophy of human life and human happiness; more charming still are the purely lyrical pieces in glorification of love and wine. Rüdagi survived his royal friend, and died poor and forgotten by the world.

There is a complete edition of all the extant poems of Rüdagi, in Persian text and metrical German translation, together with a biographical account, based on forty-six Persian MSS., in Dr H. E. Eshel's Rüdagi der Sāmānīnderichter (Göttinger Nachrichten, 1873, pp. 663–742); see also his "Neupersische Literatur" in Geiger's Grundriss der iranischen Philologie (ii.); P. Horn, Gesch. der persischen Literatur (1901), p. 73; E. G. Browne, Literary History of Persia, ii. Pickering, "A Persian Chaucer in National Review (May 1890).

RUDD, or RED-EYE (Loticus erythrophthalmus), a fish of the Cyprinid family, spread over Europe, N. and S. of the Alps, also found in Asia Minor, and common in localities where there are still waters with muddy bottom. The rudd and the roach are very similar and frequently confused by anglers; the former differs principally in the more posterior dorsal fin, which is situated exactly opposite the space between the ventral and anal fins. It is a fine fish, but little esteemed for food,
RUDDIMAN, THOMAS (1674–1757), Scottish classical scholar, was born in October 1674, at Raggal, Banffshire, where his father was a farmer. He was educated at Aberdeen University, and through the influence of Dr Archibald Pitcairne he was made assistant in the Advocates' Library, Edinburgh. His chief writings at this period were editions of Florence Wilson's De Animalibus... (1699), Aeneid... (1700) of Arthur Johnson (1687–1741), editor of the Delicæ Poetarum Scotorum. On the death of Dr Pitcairne he edited his friend's Latin verses, and arranged for the sale of his valuable library to Peter the Great of Russia. In 1714 he published Rudiments of the Latin Tongue, which was long used in Scottish schools. In 1715 he edited, with notes and annotations, the works of George Buchanan in two volumes folio. As Rudimentum was a Jacobite, the liberal views of Buchanan seemed to him to call for frequent censure. A society of scholars was formed in Edinburgh to "vindicate that incomparably learned and pious author from the calumnies of Mr Thomas Rudimentum"; but Rudimentum remains the standard edition, though George Logan, John Love, John Man and others attacked him with great vehemence. He continued to 1755, working with the help of his pupils, and was appointed professor to the university. He acquired the Caledonian Mercury in 1729, and in 1730 was appointed keeper of the Advocates' Library, resigning in 1752. He died in Edinburgh, on the 19th of January 1757.

Besides the works mentioned, the following writings of Rudimentum deserve notice: An edition of Gavin Douglas's Aeneid of Virgil (1710); the editing and completion of Anderson's Selectus Diplomata et Numismata Scotiae Thesaurum (1719); Catalogue of the Advocates' Library (1733–42); and a famous edition of Livy (1751). He also helped Joseph Ames with the Typographical Antiquities. Rudimentum was for many years the representative scholar of Scotland. Writing in 1766, Dr Johnson, after reproving Boswell for some bad Latin, significantly adds—"Rudimentum is dead." When Boswell proposed to write Rudimentum's life, "I should take pleasure in helping you to do honour to him," said Johnson.
Wiesbaden by the main line from Frankfort-on-Main to Cologne. Pop. (1905) 4773. Its situation, at the lower end of the famous vineyard district of the Rheingau, opposite Bingen and just above the romantic gorge of the Rhine, renders it a popular tourist centre. Behind the town rises the majestic Niederwald (935 ft.), on the crest of which stands the national monument, "Germania," commemorating the war of 1870–71. Rudenheim has some interesting towers. The Brömserburg, or Niederburg, a massive structure built in the 13th century, formerly belonging to the archbishops of Mainz; the Boosenburg, or Oberburg, which was rebuilt in 1668, with the exception of the keep; the Adlerturn, a relic of the fortifications of the town; and the Vorderburg, the remains of an old castle. The Gothic church of St James has some interesting paintings and monuments, and there is also a Protestant church. The town has electrical works, but its industries are mainly concerned with the preparation of wine, the best kinds being Rudesheimer Berg, Hinterhaus and Rottland.

See J. P. Schmelzeis, Rudesheim im Rheingau (Rudesheim, 1888); and Heiderinden, Rudesheim und seine Umgebung (Rüdesheim, 1888).

**RUDINI—RUDOLF**

815

RUDINI, ANTONIO STARABBA, MARQUIS DI (1839–1908), Italian statesman, was born at Palermo on the 6th of April 1839. In 1859 he joined the revolutionary committee which paved the way for Garibaldi's triumphs in the following year; then after spending a short time at Turin attached to the Italian foreign office he was elected mayor of Palermo. In 1866 he displayed considerable personal courage and energy in quelling an insurrection of separatist and reactionary tendencies. The prestige thus acquired led to his appointment as prefect of Palermo, and while occupying that position he put down brigandage throughout the province; in 1868 he was prefect of Naples. In October 1869 he became minister of the interior in the Menabrea cabinet, but he fell with that cabinet a few months later, and although elected member of parliament for Canicatti held no important position until, on the death of Mignetti in 1886, he became leader of the Right. Early in 1891 he succeeded Crispi as premier and minister of foreign affairs by forming a coalition cabinet with a part of the Left under Nicotera; his administration proved vacillating, but it initiated the economies by which Italian finances were put on a sound basis and also renewed the Triple Alliance. He was overthrown in May 1892 by a vote of the Chamber and succeeded by Giolitti. Upon the return of his rival, Crispi, to power in December 1893, he resumed political activity, allying himself with the Rudini leader, Cavallotti. The crisis consequent upon the disaster of Adua (1st March 1896) enabled Rudini to return to power as premier and minister of the interior in a cabinet formed by the veteran Conservative, General Ricotti. He concluded peace with Abyssinia, but endangered relations with Great Britain by the unauthorized publication of confidential diplomatic correspondence in a Green-book on Abyssinian affairs. To satisfy the anti-colonial party he ceded Kassala to Great Britain, provoking thereby much indignation in Italy. His internal policy was marked by continual yielding to Radical pressure and by persecution of Crispi. By dissolving the Chamber early in 1897 and favouring Radical candidates in the general election, he paved the way for the outbreak of May 1898, the suppression of which entailed considerable bloodshed and necessitated a state of siege at Milan, Naples, Florence and Leghorn. Indignation at the results of his policy led to his overthrow in June 1898. During his second term of office he thrice modified his cabinet (July 1896, December 1897, and May 1898) without strengthening his political position. In many respects he was Rudini, though leader of the Right and nominally a Conservative politician, proved a dissolving element in the Italian Conservative ranks. By his alliance with the Liberals under Nicotera in 1891, and by his understanding with the Radicals under Cavallotti in 1894–98; by abandoning his Conservative colleague, General Ricotti, to whom he owed the premiership in 1896; and by his vacillating action after his fall from power, he divided and demoralized a constitutional party which, with greater sincerity and less reliance upon political cleverness, he might have welded into a solid parliamentary organization. At the same time he was a thorough gentleman and grand seigneur. One of the largest and wealthiest landowners in Sicily, he managed his estates on liberal lines, and was never troubled by agrarian disturbances. The marquis, who had not been in office since 1898, died on the 6th of August 1908, leaving a son, Carlo, who married a daughter of Mr Henry Labouchere.

RUDOK, a small town on the Ladakh frontier of Tibet, through which all the trade of Tibet passes to Leh, and at which is maintained the Chinese outpost that for many years persistently interfered with European exploration. Rudok is picturesquely situated on the side of a hill standing isolated in the plain near the E. end of Lake Pangong, across which the official boundary between Tibet and Kashmir runs. The houses are built in tiers, whitewashed and walled in. At the top of the hill are a large palace and several monasteries painted red. About a mile away from the foot of the hill is another monastery. Rudok is about 13,500 ft. above sea-level, and the greatest altitude on the route connecting it with Lhasa at the pass of Marjom La (the water-parting between the Brahmaputra and the Sutlej) is 15,500 ft. The winter climate of Rudok and of all the towns of the Tsangpo basin, owing to the intense dryness of the air and the light fall of snow, seems to be bracing and exhilarating rather than severe. The thermometer never approaches the minimum record of Fuetera (in the same latitude and at half the absolute elevation), according to the observations of native surveyors.

RUDOLF (otherwise known as BASSO NOROK and GALLOP), a large lake of E. equatorial Africa, forming the centre of an inland drainage system, occupying the S. of the Abyssinian highlands and a portion of the great equatorial plateau. The lake itself lies towards the N. of the great East African rift valley, between the parallels of 2° 20' and 5° N., while the meridian of 36° E. is slightly W. of the centre of the northern wider part, the narrower southern portion bending to 36° E. The length along the curved axis is 183 m., the maximum width 37, and the area roughly 3500 sq. m. Its altitude is 1250 ft. Towards the S. it seems to be deep, but it is comparatively shallow in the N. Its water is brackish, but drinkable. The country bordering the lake on almost every side is sterile and forbidding. The S. end, for some 50 m. on the W. and for a longer distance on the E., is shut in by high cliffs—the escarpments of a rugged lava-strown country, which presents few signs of volcanic activity, great changes having been reported since 1889. In particular, the great volcano of Lubburu (Telets' volcano) at the S. end of the lake is said to have been destroyed between 1889 and 1897 by a sudden explosion. The highest point of the E.S.E. side of the lake is Mount Kulal, 7812 ft., while the culminating height within the basin of the lake is Mount Sil, 9280 ft., which lies about 20 m. S. of Lubburu. Further N., on the W. side, sandy plains alternate with lines of low hills, the immediate shores (on which the water appears to have encroached in very modern times) being marked by spits of sand, which in places cut off lagoons from the main body of the lake. These are the haunt of great numbers of water-birds. In 3° 8' N. the dry bed of the Turkwel—in its upper course a large river descending the slopes of Mount Elgon—approaches the lake. Near the N. end mountains again approach the shores, the most prominent being Mount Lubbur (5200 ft.), an extinct volcano with a well-preserved crater. At the extreme N.W. corner a bay some 35 m. long (Sanderson Gulf) is isolated from the rest of the lake by two long points of land. On the E. side, open arid plains, with few trees, occupy most of the N. country. One hill, in 3° 20' N., has a height of 3470 ft., and at the N.E. end, separating the lake from Lake Stefanie, is a hilly country, the highest point between the lakes being 5254 ft. Immediately N. of these hills rises the Hummurr Range, with one peak exceeding 7000 ft. Near the S. end is the volcanic island of Elmo, 10 m. long, and there are a few small islets. Just N. of 4° N. is a small volcanic
RUDOLPH I.

(1218–1291), German king, son of Albert IV. Count of Habsburg, and Hedwig, daughter of Ulrich count of Kyburg, was born at Limburg on the 1st of May 1218. At his father's death in 1239 Rudolph inherited the family estates in Alsace, and in 1245 he married Gertrude, daughter of Burkhard III. count of Hohenberg. He paid frequent visits to the court of his godfather the emperor Frederick II., and his loyalty to Frederick and to his son Conrad IV. was richly rewarded by grants of land, but in 1254 was excommunicated by Pope Innocent IV. The disorder in Germany after the fall of the Hohenstaufen afforded an opportunity for Rudolph to increase his possessions. His wife was an heiress; and on the 9th of June 1258 he married Euphemia of Luxemburg, the daughter of Count Henry IV., count of Kyburg, in 1264, he seized his valuable estates. Successful feuds with the bishops of Strassburg and Basel further augmented his wealth and his reputation; rights over various tracts of land were purchased from abbots and others; and he was also the possessor of large estates in the regions now known as Switzerland and Alsace.

These various sources of wealth and influence had rendered Rudolph the most powerful prince in S.W. Germany when, in the autumn of 1273, the princes met to elect a king. His election at Frankfort on the 20th of September 1273 was largely due to the efforts of his brother-in-law, Frederick III. of Hohenzollern, burgrave of Nuremberg. The support of Albert duke of Saxe-Lauenburg, and of Louis II. count palatine of the Rhine and duke of upper Bavaria, had been purchased by betrothing two of Rudolph's daughters; so that Ottakar II. king of Bohemia, a candidate for the throne, was almost alone in his opposition. Rudolph was crowned at Aix-la-Chapelle on the 24th of October 1273, and the coronation of which has followed by the Schiller in Der Graf von Habsburg. To win the approbation of the pope Rudolph renounced all imperial rights in Rome, the papal territory and Sicily, and promised to lead a new crusade; and Pope Gregory X., in spite of Ottakar's protests, not only recognized Rudolph himself, but persuaded Alphonso X. king of Castile, who had been chosen German king in 1257, to do the same. In November 1274 it was decided by the diet at Nuremberg that all crown estates seized since the death of the emperor Frederick II. must be restored, and that Ottakar of Bohemia must answer to the diet for not recognizing the new king. Ottakar refused to appear or to restore the provinces of Austria, Styria, Carinthia and Carniola which he had seized. He was placed under the ban; and in June 1276 war was declared against him. Having detached Henry I. duke of lower Bavaria from his side, Rudolph compelled the Bohemian king to cede the four provinces in November 1276. Ottakar was then invested with Bohemia by Rudolph, and his son Wenceslaus was betrothed to a daughter of the German king, who made a triumphal entry into Vienna. Ottakar, however, raised questions about the execution of the treaty, made an alliance with some Polish chiefs and procured the support of several German princes, including his former ally, Henry of lower Bavaria. To meet this combination Rudolph entered into alliance with Ladislaus IV. king of Hungary, and gave additional privileges to the citizens of Vienna. On the 26th of August 1278 the rival armies met on the banks of the river March near Dürnkrut, and Ottakar was defeated and killed. Moravia was subdued and its government entrusted to Rudolph's representatives, while Wenceslaus was again betrothed to one of his daughters.

Rudolph's attention was next turned to his new possessions in Austria and the adjacent counties. He spent several years in establishing his authority there, but found some difficulty in persuading his vassals to provide forces. the hostility of the princes was overcome, and in December 1282 Rudolph invested his sons Albert and Rudolph with the duchies of Austria and Styria at Augsburg, and laid the foundations of the greatness of the house of Habsburg.

Turning to the west he compelled Philip I. count of upper Burgundy to cede some districts to him in 1281, forced the citizens of Berne to pay the tribute which they had previously refused, and in 1280 marched against Philip's successor, Otto IV., and compelled him to do homage. In 1281 his first wife died, and on the 5th of February 1284 he married Isabella, daughter of Hugh IV. duke of Burgundy. Rudolph was not very successful in restoring internal peace to Germany. Orders were indeed issued for the establishment of landpeaces in Bavaria, Franconia and Swabia, and afterwards for the whole of Germany; but the king lacked the power, or the determination, to enforce them, although in December 1289 he led an expedition into Thuringia where he destroyed a number of robber-casts and captured the castle of Ronneburg. In 1288 he invested his son Albert as German king; but the princes refused on the pretext of their inability to support two kings, but perhaps because they feared the increasing power of the Habsburgs. Rudolph died at Spires on the 15th of July 1291 and was buried in the cathedral of that city. He had a large family, but only one of his sons, Albert, afterwards the German king Albert I., survived him. Rudolph was a tall man with pale face and prominent nose. He possessed many excellent qualities, bravery, piety and generosity; but his reign is memorable rather in the history of the house of Habsburg than in that of the kingdom of Germany.

BIBLIOGRAPHY.—The original authorities relating to the time and life of Rudolph are found in the Monumenta Germaniae historica. Scriptores, Band xvii. (Hanover and Berlin, 1826 fol.). The following should also be consulted: Acta imperii selecta, Urkundenbuch und Archiv und Kaiser, edited by I. Huber (Innsbruck, 1870); Acta imperii inedita seculi XIII et XIV. Urkunden und Briefe zur Geschichte des Kaiserreichs, edited by E. Winkelmann (Innsbruck, 1885); Aikenstücker zur Geschichte des deutschen Reiches von Fugger Rudolf I. und Albert I., edited by F. Kaltenebrunner (Vienna, 1889); M. Gerbert, Codex epistolarii Rudolf I. (Sanblas, 1772); F. J. Bodmann, Codex epistolarii Rudolf I. Romanorum regis (Leipzig, 1806).
RUDOLPH II.—RUDOLPH THE BALD

RUDOLPH II. (1552-1612), Roman emperor, son of the emperor Maximilian II. by his wife Maria, daughter of the emperor Charles V., was born in Vienna on the 18th of July 1552. In 1563 he was sent to Spain, where his natural abilities were improved by a good education, but he lacked the frank and tolerant spirit of his father, resembling rather his uncle Philip II. of Spain. In 1572 he was crowned king of Hungary, three years later king of Bohemia; and in October 1575 he was chosen king of the Romans, or German king, at Regensburg, becoming emperor on his father's death in October 1576. The importance of Rudolph's reign is negative rather than positive, consisting more in what he did not do than in what he did; although it is questionable whether any ruler could have prevented the religious struggles of Germany and the Thirty Years' War.

The most active part of the emperor's life was the period from his accession to about 1597. During that time he attended the infrequent imperial diets, and took an interest in the struggle in the Netherlands and the defence of the empire against the Turks. He was at times suspicious of the papal policy, while his relations with Spain were somewhat inharmonious. As a convinced Roman Catholic he forwarded the progress of the counter-reformation, and in general the tolerant policy of Maximilian II. was reversed. Political as well as religious privileges were attacked; the administration was conducted by Germans; and the result was a considerable amount of discontent which became very pronounced about the opening of the 17th century. Concurrently with the growth of this unrest Rudolph had become increasingly subject to attacks of depression and eccentricity, which were so serious as to amount almost to insanity. In 1604, after a war with Turkey had been in progress since 1593, many of the Hungarians rebelled against Rudolph and chose Stephen Bocskay as their prince. By this time the members of the Habsburg family were thoroughly alarmed at the indifference or incompetence of the emperor; and their anxieties were not diminished by the knowledge that he was in feeble health, was unmarried, and had refused to take any steps towards securing the election of a successor. In April 1606 they declared Rudolph incapable of ruling, and recognized one of his younger brothers, the archduke Matthias, afterwards emperor, as their head; and in the following June Matthias, having already with the emperor's reluctant consent taken the conduct of affairs into his own hands, made peace by granting extensive concessions to the rebellious Hungarians, and concluded a treaty with the sultan in November of the same year. Then shaking off his lethargy Rudolph prepared to renew the war with Turkey; a move which Matthias met by throwing himself upon the support of the national party in Hungary. Matthias also found adherents in other parts of his brother's dominions, with the result that in June 1608 the emperor was compelled to cede to him the kingdom of Hungary together with the government of Austria and Moravia. Rudolph now sought the aid of the princes of the empire, and even of the Protestants; but he had met with no success in this direction when trouble arose in Bohemia. Having at first rejected the demand of the Bohemians for greater religious liberty, the emperor was soon obliged to yield to superior force, and in 1607 he acceded to the popular wishes by issuing the Letter of Majesty (Majestätsbrief), and then made similar concessions to his subjects in Silesia and elsewhere. A short reconciliation with Matthias was followed by further disorder in Bohemia, which was invaded by Rudolf's cousin, the archduke Leopold (1586-1632). The Bohemians invoked the aid of Matthias, who gathered an army; and in 1611 the emperor, practically a prisoner at Prague, was again forced to cede a kingdom to his brother. Rudolph died at Prague, his usual place of residence, on the 20th of January 1612, and was succeeded as emperor by Matthias.

Rudolph was a clever and cultured man, greatly interested in chemistry, alchemy, astronomy and astrology; he was a patron of Tycho Brahe and Kepler, and was himself something of a scholar and an artist. He was the greatest collector of his age, his agents ransacking Europe to fill his museums with rare works of art. His education at the Spanish court and an hereditary tendency to insanity, however, made him haughty, suspicious and consequently very unpopular, while even in his best days the temper of his mind was that of a recluse rather than of a ruler.

The sources for the life and times of Rudolph II. are somewhat scanty, as many of the official documents of the reign, which were kept at Prague and not at Vienna, were destroyed, probably during the Thirty Years' War. The best authorities, however, are: Rudolf II., epistola ineditæ, edited by B. Comte de Pace (Vienna, 1771); M. Ritter, Quellenbeiträge zur Geschichte des Kaisers Rudolf II. (Munich, 1872); and Deutsche Geschichte im Zeitalter der Gegenreformation und des dreissigjährigen Krieges (Stuttgart, 1887 fol.); L. von Ranke, Zur deutschen Geschichte: Vom Religionsfrieden bis zum 30-jährigen Kriege (Leipzig, 1868); A. Gindely, Rudolf II. und seine Zeit (Prague, 1862-68); F. Steuwe, Die Verhandlungen über die Nachfolge Kaiser Rudolfs II. (Munich, 1886); in the Allgemeine Deutsche Biographie, Band xxix. (Leipzig, 1886); and Der Uebergang des dreissigjährigen Krieges (Munich, 1875); F. von Bezold, Kaiser Rudolf II. und die heilige Liga (Munich, 1886); J. Jansen, Geschichte des Deutschen Volks seit dem Ausgang des Mittelalters (Freiburg, 1878 fol.), of which there is an English translation by M. A. Mitchell and A. M. Christie (London, 1896 fol.); and H. Moritz, Die Welt Rund erfefs. II. (Marburg, 1895).

RUDOLPH, or RAOUl, known as RUDOLPH GLAEBER (Rudolph the Bald) (d. c. 1050), French chronicler, was born in...

See W. Lippert, König Rudolf von Frankreich (Leipzig, 1886).

RUDOLPH (d. 1080), German king, and duke of Swabia, opponent of the emperor Henry IV., was a son of Kuno count of Rheinfelden, who possessed estates in both Burgundy and Swabia. He received the duchy of Swabia from Agnes, regent and mother of the young king, Henry IV., in 1047, and two years later married the king's sister Matilda (1045-1060), and was made administrator of the kingdom of Burgundy, or Arles. Differences soon arose between the king and his brother-in-law, whose loyalty was suspected during the Saxon War of 1073. When Henry was excommunicated and deposed by pope Gregory VII., the princes met at Forchheim, and elected Rudolph as German king. He renounced the right of investiture, disclaimed any intention of making the crown hereditary in his own family, and was crowned at Mainz on the 14th of March 1077. He found no support in Swabia, but, uniting with the Saxons, won two victories over Henry's troops, and, in 1080, was recognized by the pope. On the 15th of October 1080, Rudolph was severely wounded at Hohenmölsen, and died the next day. He was buried at Merseburg, where his beautiful bronze tomb is still to be seen.

See O. Grund, Die Wahl Rudolfs von Rheinfelden zum Gegenkönig (Leipzig, 1880).

RUDOLPH, or RAOUl, known as RUDOLPH GLAEBER (Rudolph the Bald) (d. c. 1050), French chronicler, was born in...
Burgundy about 852, and was in turn an inmate of the monasteries of St. Le ger at Champaune and St. Benigne at Dijon, afterwards entering the famous abbey of Cluny, and becoming a monk at St. Germain at Auxerre before 1039. He also appears to have visited Italy. His Historiarum sui temporis libri V., dedicated to St. Odilo, abbot of Cluny, purports to be a universal history from 900 to 1044; but is an irregular narration of events in France and Burgundy. Rudolph was a strong believer in the approaching end of the world.

RUDELSTADT, a town of Germany, capital of the principality of Schwarzburg-Rudolstadt, and the chief residence of the prince, lies on the left bank of the Saale, 18 m. S.W. of Jena, by the railway Grossheringen-Saalfeld, in one of the most beautiful districts of Thuringia. Pop. (1905) 12,494. The picturesque town is a favourite tourist resort. Besides containing the government buildings of the little principality, Rudolstadt is well provided with schools and other institutions, including a library of 65,000 volumes. The residence of the prince is the Heideeburg, a palace on an eminence 200 ft. above the Saale, which was rebuilt after a fire in 1735, and contains a picture gallery, a magnificent banqueting hall and a library. The Ludwigsburg, another palace in the town, built in 1742, accommodates the natural history collections belonging to the prince. The principal church dates from the end of the 15th century and contains tombs and effigies of many former princes. In the Anger, a public park between the town and the river, is the theatre. The Rudolstadt—a handsome hydropathic establishment with a richly decorated interior—lying amidst extensive grounds, is also noticeable. Various memorials in and near the town commemorate the visits of Schiller to the neighbourhood in 1787 and 1788. The industries of the place include the manufacture of porcelain, chocolate and dye-stuffs, wool-spinning and bell-founding.

The name of Rudolstadt occurs in an inventory of the possessions of the abbey of Hersfeld in the year 800. After passing into the possession of the German kings and then of the rulers of Orlamünde and of Weimar, it came into the hands of the counts of Schwarburg in 1335. Its civic rights were confirmed in 1304, and since 1350 it has been the residence of the ruling house of Schwarzburg-Rudolstadt.

See: Renan, Chose von Rudolstadt (Rudolstadt, 1860); Anemüller, Geschichtsbilder aus der Vergangenheit Rudolstädts (Rudolstadt, 1888); and Woel, Rudolstadt (2nd ed. Leipzig, 1890).

RUÐRA (probably from the root rud, “to howl,” hence “the howler”), in Hindu Vedic mythology, a storm god, and father of the Maruts who are frequently called Rudris. He shoots tempests at the earth, but is not essentially a malevolent deity, being invoked as a protector of cattle. In the Atharvaveda, he is lord of life and death, and in later Hinduism one of the Hindu trinity, the god Siva.

See A. A. Macdonell, Vedic Mythology (Strassburg, 1897); Sir William Muir, Original Sanskrit Texts, iv. 299-320.

RUE (Fr. rue, Lat. ruta, from Gr. ῥοῦς, the Peloponnesian word for the plant known as ῥοῦς), the name of a woody or bushy herb, belonging to the genus Ruta, especially Ruta graveolens, the “common rue,” a plant with bluish green spotted leaves and greenish yellow flowers. It has a strong pungent smell and the leaves have a bitter taste. The plant was much used in medieval and later medicine as a stimulant and irritant drug. It was commonly supposed to be much used by witches. From its association with “rue,” sorrow, repentance (O. Eng. hréaw, from hréowan, to be sorry for, cf. Ger. resen), the plant was also known as “herb of grace,” and was taken as the symbol of repentance.

RUEDA, LOPE DE (1510?–1565), Spanish dramatist, was born early in the 16th century at Seville, where, according to Cervantes, he worked as a metal-beater. His name first occurs in 1534 as acting at Benavente, and between 1558 and 1561 he was manager of a strolling company which visited Segovia, Seville, Toledo, Madrid, Valencia and Córdova. In the last-named city Rueda fell ill, and on the 21st of March 1565 made a will which he was too exhausted to sign; he probably died shortly afterwards, and is said by Cervantes to have been buried in Córdova cathedral. He was twice married; first to a disreputable actress named Maríana, who became the mistress of the duke de Medinaceli; and second to Rafaela Angela, who bore him a daughter. His works were issued posthumously in 1567 by Timoneda, who toned down certain passages in the texts. Rueda’s more ambitious plays are mostly adapted from the Italian; in Enfamia he draws on Boccaccio, in Medor he utilizes Giancarli’s Zingara, in Armelina he combines Raineri’s Attilia with Cecchi’s Servigial, and in Las Engañados he uses G’Ingnanati, a comedy produced by the Intronati, a literary society at Siena. These follow the original so closely that they give no idea of Rueda’s talent; but in his pasos or prose interludes he displays an abundance of riotous humour, great knowledge of low life, and a most happy gift of dialogue. His predecessors mostly wrote for courtly audiences or for the study; Rueda with his storytellers created a taste for the drama which he was able to gratify, and he is admitted both by Cervantes and Lope de Vega to be the true founder of the national theatre.

His works have been reprinted by the marquis de la Fuenzal del Valle in the Colección de libros raros ó curiosos, vols. xxiii. and xxiv.

RUEIL, a town of N. France, in the department of Seine-et-Oise, at the W. foot of Mt. Valérien, 6 m. W. of Paris by tramway. Pop. (1906) 10,459. Rueil has a church rebuilt under Napoleon III, in exact imitation of a previous church in the Renaissance style, and containing the tombs of the Empress Josephine and her daughter Hortense de Beauharnais. In the 17th century Richelieu built a château which no longer exists. Rueil has important photographic works and manufactures of lime and cement, &c. Close to the town is the château of Malmaison, a building of the 18th century famous as the residence of the empress Josephine. It was afterwards occupied by Maria Christina, queen of Spain, and by the empress Eugénie. In 1900 the owner, Daniel Osiris, presented it and the park to the nation; the apartments have been as far as possible restored to the condition in which they were when inhabited by Josephine and Napoleon.

RUFF, a bird so called from the very beautiful and remarkable frill of elongated feathers that, just before the breeding-season, grow thickly round the neck of the male, who is considerably larger than the female, known as the reeve. In many respects this species, the Trinca pugnax of Linnaeus and the Machetes pugnax of modern ornithologists, is one of the most singular in existence. The best account is that given in 1813 by G. Montagu (Suppl. Orn. Dictionary), who seems to have been struck by the peculiarities of the species, and, to investigate them, visited the fens of Lincolnshire, possibly excited thereto by the example of T. Pennant, whose information, collected there in 1769, was of a kind to provoke further inquiry, while Daniel (Rural Sports, iii. p. 234) had added some other particulars, and subsequently G. Graves in 1816 repeated in the same extent the experience of his predecessors. Since that time the great changes produced by the drainage of the fen-country and by the banishment of this species from nearly the whole of it, so that R. Liddell (Orig. Fauna of Norfolk, pp. 68–73) and H. Stevenson (Birds of Norfolk, ii. pp. 261–271) can alone be cited as modern witnesses of its habits in England, while the trade of netting or snaring ruffs and fattening them for the table has for many years practically ceased.

The cock bird, when, to use the fenman’s expression, he has
not "his show on," and the hen at all seasons, offer no very remarkable deviation from ordinary sandpipers; outwardly¹ there is nothing, except the unequal size of the two sexes, to rouse suspicion of any abnormal peculiarity. But when spring comes all is changed. In a surprisingly short time the feathers clothing the face of the male are shed, and their place is taken by papillae or small caruncles of bright yellow or pale pink. From each side of his head sprouts a tuft of stiff curled feathers, while the feathers of the throat change colour, and beneath and around it sprouts the frill or ruff already mentioned as giving the bird his name. The feathers which form this remarkable adornment are, like those of the "ear-tufts," stiff and incurved at the end, but much longer—measuring more than 2 in. They are closely arrayed, capable of depression or elevation, and form a shield to the front of the breast impenetrable by the bill of a rival.² More extraordinary than this, from one point of view, is the great variety of coloration that obtains in these temporary outgrowths. Considering the really few colours that the birds exhibit, the variation is something marvellous, so that fifty examples may be compared without finding a very close resemblance between any two of other species of Limicolae bird, so far as is known, any tendency to it. Indeed, in many species of Limicolae, as the dotterel, the godwits (q.v.), phalaropes and perhaps some others, the female is larger and more brightly coloured than the males, who in such cases seems to take upon himself some at least of the domestic duties. Both Montagu and Graves, to say nothing of other writers, state that the ruffs, in England, were far more numerous than the reedes; and their testimony can hardly be doubted; though in Germany J. F. Naumann (Vög, Deutschland's, vii. p. 544) considers that this is only the case in the earlier part of the season, and that later the females greatly outnumber the males. By no one have the ruffs' characteristics been more happily described than by J. Wolley, in a communication to W. C. Hewitson (Eggs of Brit. Birds, 3d ed., p. 346), as follows:—

"The ruff, like other fine gentlemen, takes much more trouble with his courtship than with his duties as a husband. Whilst the reedes are sitting on their eggs, scattered about the swamps, he is to be seen far away flitting about in flocks, and on the ground dancing and sparring with his companions. Before they are confined to their nests, it is wonderful with what devotion the females are attended by their gay followers, who seem to be each trying to be more attentive than the rest. Nothing can be more expressive of humility and ardent love than some of the actions of the ruff. He throws himself prostrate on the ground, with every feather on his body standing up and quivering; but he seems as if afraid of coming too near his mistress. If she flies off, he starts up in an instant to arrive before her at the next place of alighting; and all his actions are full of life and spirit. But none of his spirit is in vain; for she never comes to live in a care of any, but after an enemy. In the [Lapland] marshes, a reeve now and then flies near with a scarcely audible ka-ka-ka-kuk; but she seems a dull bird, and makes no noisy attack on an invader."

The breeding-grounds of the ruff extend from Great Britain across N. Europe and Asia; but the birds become less numerous towards the E. They winter in India, reaching even Ceylon, and Africa as far as the Cape of Good Hope. The ruff also occasionally makes visits to Ireland. There are several well-authenticated records of its occurrence on the E. coast of the United States, while an example is stated (Ibis, 1875; P. 332) to have been received from the N. of S. America.

RUFFIAN (Fr. ruffian, It. ruffiano), a brutal, violent person, a swaggering, low bully. The etymology is obscure, but the word has been connected with "ruffler," a bully, swaggerer, one who "ruffles" (M. Du. roffelen, to pander). An early derivation, quoted in Du Cange, derives it from Lat. rufus, red, as the hair of the meretricies, with whom the ruffiani were generally associated, was red or gold, as contrasted with the black hair of sober matrons.

RUFFO, FABRIZIO (1744-1827), Neapolitan cardinal and politician, was born at San Lucido in Calabria on the 16th of September 1744. His father, Litterio Ruffo, was duke of Baranello, and his mother, Giustiana, was of the family of Colonna. Fabrizio obtained his education to his uncle, the cardinal Thomas Ruffo, then dean of the Sacred College. In early life he secured the favour of Giovanni Angelo Braschi di Cesera, who in 1775 became Pope Pius VI. Ruffo was placed by the pope among the chierici di camera—the clerks who formed the papal civil and financial service. He was later promoted to be treasurer-general, a post which carried with it the ministry of war. Ruffo's conduct in office was diversely judged. Colletta, the historian of Naples, speaks of him as corrupt, and Jomini repeats the charge. Ruffo's biographer, Sachinelli, says he incurred hostility by restricting the feudal powers of some of the landowners in the papal states. In 1791 he was removed from the treasurership, but was created cardinal on the 20th of September, though he was not in orders. He never became a priest. Ruffo went to Naples, where he was named administrator of the royal domain of Caserta, and received the abbey of S. Sophia in Benevento in commendam. When in December 1798 the French troops advanced on Naples, Ruffo fled to Erremon with the royal family. He was chosen to head a royalist movement in Calabria, where his family, though impoverished by debt, exercised large feudal powers. He was named vicar-general on the 25th of January 1790. On the 8th of February he landed at
La Cortona with a small following, and began to raise the so-called “army of the faith” in association with Fra Diavolo and other brigand leaders. Rufino had no difficulty in upsetting the republicanism and subduing the country, which was known by June as having advanced to Naples (See Naples and Nelson). The campaign has given rise to much controversy. Rufino appears to have lost favour with the king by showing a tendency to spare the republicans. He resigned his vicar-generalship to the prince of Caserta, and during the second French conquest and the reigns of Joseph Bonaparte and Murat he lived quietly in Naples. Some notice was taken of him by Napoleon, but he never held an important post. After the restoration of the Bourbons he was received into favour. During the revolutionary troubles of 1822 he was consulted by the king, and was even in office for a very short time as a “loyalist” minister. He died on the 13th of December 1827.

The account of Rufino given in Colletta’s History of Naples (English translation, Edinburgh, 1860) must be taken with caution. Colletta was a violent liberal partisan, who wrote in exile, and largely from memory. He has been corrected by the Duca de Laura, Istoria della storia dei Reame di Napoli di Pietro Colletta (Naples, 1877). Rufino’s own side of the question is stated in Memorie Storiche sulla vita del Cardinale Fabrizio Rufino, by Domenico Sacchini (Naples, 1836). The work of Laura and Colletta is important in the study of Greek theology. This combination of the contemplative life and the life of learning had already developed in the Egyptian monasteries. When Jerome came to Bethlehem in 386, the friendship formed at Aquileia was renewed. Another of the intimates of Rufino was John, bishop of Jerusalem, and formerly a Nitrian monk, by whom he was ordained to the priesthood in 350. In 394, in consequence of the attack upon the doctrines of Origen made by Epiphanius of Salamis during a visit to Jerusalem, a fierce quarrel broke out, which found Rufino and Jerome on different sides; and, though three years afterwards a formal reconciliation was brought about between Jerome and John, the breach between Jerome and Rufino remained unhealed.

In the autumn of 397 Rufino embarked for Rome, where, finding that the theological controversies of the East were exciting much interest and curiosity, he published a Latin translation of the Apology of Pamphilus for Origen, and also (388–90) a somewhat free rendering of the περί άρχων (or De Præfatione) of that author himself. In the preface to the latter work he refers to the fact that he had long been acquainted with Origen, and having already translated some of his works with modifications of ambiguous doctrinal expressions. This allusion annoyed Jerome, who was exceedingly sensitive as to his reputation for orthodoxy, and the consequence was a bitter pamphlet war, very wonderful to the modern onlooker, who finds it difficult to see anything discreditable in the accusation against a biblical scholar that he had once thought well of Origen, or in the countercharge against a translator that he had avowedly exercised editorial functions as well. At the instigation of the Theophilus of Alexandria, Anastasius (pope 398–402) summoned Rufino from Aquileia to Rome to vindicate his orthodoxy; but he excused himself from a personal attendance in a written Apologia pro fide sua. The pope in his reply expressly condemned Origen, but left the question of Rufino’s orthodoxy to his own conscience. He was, however, regarded with suspicion in orthodox circles (cf. the Decretum Gelasii, § 20) in spite of his services to Christian literature. In 408 we find Rufino at the monastery of Pinetum (in the Campagna?); then he was driven by the arrival of Alaric to Sicily, being accompanied by Melania in his flight. In Sicily he was engaged in translating the Homilies of Origen when he died in 410.

The original works of Rufino are—(1) De Adulatorum Librarium Origenis—an appendix to his translation of the Apology of Pamphilus, and intended to show that many of the features in Origen’s teaching which were then held to be objectionable arise from interpolations and falsifications of the genuine text; (2) De Benedictibus XII Patriarcharum Libri II—an exposition of Gen. xlix.; (3) Apologia s. Insectarium in Hieronymum Libri II; (4) Apologia pro Fide Sui et Theologiae; (5) Apologia pro Sua Compendio Logismorum; (6) The lives of thirty-three monks of the Nitrian desert; (7) Expositio Symboli, a commentary on the creed of Aquileia comparing it with that of Rome, which is valuable for its evidence as to church teaching in the 4th century, and which was very popular; (8) the Canon Paschalis of Anatolius Alexandrinus (see the Canon Paschalis of Blondel). We can hardly overestimate the influence which Rufino exercised over Western theologians by thus putting the great Greek fathers into the Latin tongue. D. Vallarsi’s unpublished edition of Rufinus (vol. i., fol. Verona, 1745) contains the De Benedictibus, the Apologies, the

Expositio Symboli, the Historia Eremits, and two original books of the Hist. Ecl. See also Migne, Paetrol. (vol. xxii. of the Latin series). For the translations, see the various editions of Origen, Eusebius, &c.

RUFUS, GAIS VALGISI, Latin poet, friend of Horace and Maecenas, and consul in 12 B.C. He was known as a writer of elegies and epigrams, and his contemporaries believed him capable of great things in epic. The author of the panegyric on Messalla declares Rufus to be the only poet fitted to be the great man's Homer. Rufus did not, however, confine himself to poetry. He discussed grammatical difficulties in correspondence, translated the rhetorical manual of his teacher Apotianus, wrote a treatise on Pergamum, and began a treatise on medicinal plants, dedicated to Augustus. Horace addressed to him the ninth ode of the second book.

Fragments in R. Weichert, Postearum Latinarum Vitae et Carminum Reliquiae (1836); R. Unger, De C. Valgii Ruf Poematis (1845); O. Ribbeck, Geschichte der römischen Dichtung (1889), ii. M. Schanz, Geschichte der römischen Literatur (1899), ii. 1; Teuffel, Hist. of Roman Literature (Eng. trans., 1900), 241.

RUFUS, LUCIUS VARIUS (c. 74-14 B.C.), Roman poet of the Augustan age. He was the friend of Virgil, after whose death he and Plotius Tucca prepared the Aeneid for publication, and of Horace, for whom he and Virgil obtained an introduction to Maecenas. Horace speaks of him as a master of epic and the only poet capable of celebrating the achievements of Vipsanius Agrippa (Odes, i. 6); Virgil (under the name of Lycidas, Ecl. ix. 35) regrets that he had hitherto produced nothing comparable to the work of Varius or Helvius Cinna. FromMacrobius (Saturnalia, vi. 1, 39; 2, 19) we learn that Varius composed an epic poem De Morte, some lines of which are quoted as having been imitated or appropriated by Virgil; Horace (Sat. 1. 10, 43) probably alludes to another epic, and, according to the scholiast on Epist. i. 16, 27-29, these three lines are taken bodily from a panegyric of Varius on Augustus. But his most famous literary production was the tragedy Thesytes, which Quintilian (Inst. Orat. x. 1, 98) declares fit to rank with any of the Greek tragedies. The didascalia (which is preserved in a Paris MS.) informs us that it was produced at the games celebrated (29 B.C.) by Augustus in honour of the victory at Actium, and that Varius received a present of a million sesterces from the emperor.

Fragments in E. Bährers, Frag. Postearum Romanorum (1886); monographs by A. Weichert (1836) and R. Unger (1870, 1878, 1898), M. Schanz, Geschichte der römischen Literatur (1899), ii. 1; Teuffel, Hist. of Roman Literature (Eng. trans., 1900), 223.

Rug, a term of Scandinavian origin (cf. Swed. rugg, rough hair; Norw. dia. rugs, rough), and probably connected with "rough" and "rag," originally for a kind of coarse woollen material, like frieze; hence it is used as a piece of thick material used as a wrap or covering for the knees or body in travelling or as a -rug on the floor, a thick mat or small-sized carpet laid on the floor (see Carpet).

Rugby, a market town in the Rugby parliamentary division of Warwickshire, England, finely situated on a tableland rising from the S. bank of the Avon, near the Oxford Canal. Pop. of urban district (1901), 16,830. It is an important junction on the London & North-Western railway, by which it is 82 m. N.W. from London; it is served also by the Great Central railway and by a branch of the Midland railway from Leicester.

Rugby, a town in the county of Warwickshire, England, was founded and endowed under the will of Laurence Sheriff, a merchant grocer and servant to Queen Elizabeth, and a native either of Rugby or of the neighbouring village of Brownsover. The endowment consisted of the parsonage of Brownsover, Sheriff's mansion house in Rugby, and one-third (8 acres) of his estate in Middlesex, near the Foundling Hospital, London, which, being let on building leases, gradually increased to about £5000 a year. The full endowment was obtained in 1653. The school originally stood opposite the parish church, and was removed to its present site on the S. side of the town between 1740 and 1750. In 1809 it was rebuilt from designs by Henry Hardflew (1772-1820); the chapel, dedicated to St Lawrence, was added in 1820. At the tercentenary of the school in 1867 subscriptions were set on foot for founding scholarships, building additional schoolrooms, rebuilding or enlarging the chapel and other objects. The chapel was rebuilt and reconsecrated in 1872, and further additions were made in 1898. A swimming bath was erected in 1876; the Temple observatory, containing a fine equatorial refractor by Alvan Clark, was built in 1877, and the Temple reading-room with the art museum in 1878. The workshops underneath the gymnasium were opened in 1880, and a new big school and class-rooms were erected in 1885. From about 70 to 1777 the numbers attending the school have increased to nearly 600. A great impulse was given to the progress of the school during the headmastership of Thomas Arnold, 1827-42. Among Arnold's successors were Archibald Campbell Tait and Frederick Temple, both afterwards archbishops of Canterbury.

The parish church of St Andrew was rebuilt from designs by W. Butterfield and re-consecrated in 1879. A tower and spire were added in 1895. An aisle commemorates John Moultrie (1799-1874), rector, widely known as the "poet pastor." The church of Holy Trinity is by Sir G. G. Scott, and the Roman Catholic church of St Marie by A. W. Pugin. Rugby is mainly agricultural; there is a large cattle market, and several fairs are held annually.

The early history of Rugby is obscure, but a settlement of the Danes is presumed from the name, and from the neighbouring tract of Dunsmore Heath (Danesmoor). Rugby was originally a hamlet of the manor of Clifton, parish of Dunsmore, and is separately treated of as such in Domesday Book. Ernaldus de Bosco (Ernald of Bos), lord of the manor of Clifton, seems to have erected the first chapel in Rugby, in the reign of Stephen, about 1140. It was afterwards granted by him, with other lands, to endow the abbey of St Mary, Leicester, which grant was confirmed by his successors and by royal charter of Henry II. In the second year of King John (1200) a suit took place between Henry de Rokeyby, lord of the manor of Rugby, and Paul, abbot of St Mary, Leicester, in which was evidently obstructing the acquisition of Rugby, on condition of homage and service to the abbots of Leicester. By virtue of this agreement the chapel was converted into a parish church and the vicarage into a rectory.

Ruge Arnold (1820-1880), German philosopher and political writer, was born at Bergen, in the island of Rügen, on the 13th of September 1802. He studied at Halle, Jena and Heidelberg, and became an adherent of the party which sought to create a free and united Germany. For his zeal he was confined for five years in the fortress of Kolberg, where he studied Plato and the Greek poets. On his release in 1830 he published Schill und die Seinen, a tragedy, and a translation of the Comedy of Errors. Ruge settled in Halle, where in 1837 with E. T. Eckermeyer he founded the Italisches Jahrbücher für deutsche Kunst und Wissenschaft. In this periodical he discussed the questions of the time from the point of view of the Hegelian philosophy. The Jahrbücher was detested by the orthodox party in Prussia; and was finally suppressed by the Saxon government in 1843. In Paris Ruge tried to act with Karl Marx as co-editor of the Deutsch-Französische Jahrbücher, but had little sympathy with Marx's socialist theories, and soon left him. In the revolutionary movement of 1848 he organized the Extreme Left in the Frankfurt parliament, and for some time he lived in Berlin as the editor of the Die Reform. The Prussian government intervened and Ruge soon afterwards left for Paris, hoping, through his friend Alexandre Ledru-Rollin, to establish relations between German and French republicans; but in 1849 both Ledru-Rollin and Ruge had to take refuge in London. Here, in company with Giuseppe Mazzini and other advanced politicians, they formed a "Euro- pean Democratic Committee." From this Ruge soon withdrew, and in 1850 went to Geneva, where he supported himself by teaching and writing. In 1866 and 1870 he vigorously
supported Prussia against Austria, and Germany against France.
In his last years he received from the German government a
pension of 1000 marks. He died on the 31st of December 1880.
Ruge was a leader in religious and political liberalism, but did
not produce any work of enduring importance. In 1846-48 his
Gesammelte Schriften were published in ten volumes. After this
time he wrote, among other books, Unser System, Revolutions-
volnellen, Die Loge des Humanismus, and Aus fruherer Zeit (his
memoirs). He also wrote many poems, and several dramas and
romances, and translated into German various English works,
including the Letters of Junius and Buckle's History of Civilisation.
His Letters and Diary (1825-80) were published by Paul Nerrlich
(Berlin, 1885-87). See A. W. Bolin's L. Feuerbach, pp. 127-52
(Stuttgart, 1891).

Rugeley, a market town in the Lichfield parliamentary
of urban district (1901), 4447. The London & North-Western
railway has stations on the main line (Trent Valley, 124 m. N.W.
from London), and at the town, on a branch line to Walsall.
The Grand Trunk canal here follows the Trent. To the S.W. lie the hills of Cannock Chase. The church of St Augustine is modern; of the parish church of the 14th century only the
nave remains. The present church was built in 1855. The market hall and assembly-room are contained in one building
(1879). A grammar school was founded in 1611. There are
ironfoundries, corn-mills and tanneries; and the parish includes
several collieries.

Rügen, an island of Germany, in the Baltic, immediately
opposite Stralsund, 13 m. off the north-west coast of Pomerania
in Prussia, from which it is separated by the narrow Stralsand,
or Boddin. Its shape is exceedingly irregular, and its coast-
line is broken by numerous bays and peninsulas, sometimes
of considerable size. The general name is applied by the
natives only to the roughly triangular main trunk of the island,
while the larger peninsulas, the landward extremities of which
taper to narrow necks of land, are considered to be as distinct
from Rügen as the various adjacent smaller islands which are
also included for statistical purposes under the name. The
chief peninsulas are those of Jasmund and Wittow on the north,
and Mönchgut, at one time the property of the monastery of
Eldena, on the south-east; and the chief neighbouring islands
are Unmanz and Hinddensee, both off the north-west coast.
Rügen is the largest island in Germany. It is bounded on
the north by the Baltic, on the east by the south branch of
the Rugen river, and by the island of S. grandson, in the
west by the island of Putbus, and its area is 377 sq. m. The surface gradually rises towards the west to Rugard (335 ft.)—the "eye of Rügen"—near Bergen,
but the highest point is the Hertaburg (505 ft.) in Jasmund.
Erratic blocks are scattered throughout the island, and the
roads are made with granite. Though much of Rügen is flat
and sandy, the fine beech woods which cover a great part of
it, and the bold northern coast scenery combine with the
convenient sea-bathing offered by the various villages around
the coast to attract large numbers of visitors. The most beau-
tiful and attractive part of the island is the peninsula of
Jasmund, which terminates to the north in the Stubbekammer
(Slavonic for " rock steps "), a sheer chalk cliff, the summit of which, the
Königstuhl, is 420 ft. above the sea. The east of Jasmund is
clothed with an extensive beech wood called the Stubbeneitz,
in which lies the Borg, or Herta Lake. Connected with Jasmund
by the narrow isthmus of Schabe to the west is the peninsula of
Wittow, the most fertile part of the island. At its north-west extremity rises the height of Arcona, with a
lighthouse.

A railway connects the island with Stralsund, and from the
landing-stage at Altefähr a railway traverses the island, passing
the capital Bergen to Sassnitz, on the north-east coast. Hence
a regular steamboat service connects with Trelleborg in Sweden,
thus affording direct communication between Berlin and Stock-
holm. The other chief places are Garz, Sagard, Ginstg
and Putbus, the last being the old capital of a barony of the
princes of Putbus. Sassnitz, Göhren, Sellin and Lauterbach-
Putbus are among the favourite bathing resorts. Schoritz was
the birthplace of the patriot and poet, Ernst Moritz Arndt.

Ecclesiastically Rügen is divided into 75 parishes, in which the
pastoral succession is said to be almost hereditary. The
inhabitants are distinguished from those of the mainland by
peculiarities of dress; and even then the various peninsulas differ from each other in these particulars.
The peninsula of Mönchgut has preserved its peculiarities;
but there, too, primitive simplicity is yielding to the influence
of the annual stream of summer visitors. The inhabitants
raise some cattle, and Rügen has long been famous for its
goose; but the only really considerable industry is fishing,—
the herring-fishery being especially important. Rügen, with
the neighbouring islands, forms a governmental department,
with a population (1905) of 47,023.

The original Germanic inhabitants of Rügen were dispossessed
by Slavs; and there are still various relics of the long reign of paganism
that ensued. In the Stubbenitz and elsewhere Huns' or giants'
graves are common; and near the Hertha Lake are the ruins
of an ancient edifice which some have sought to identify with the
shrine of the heathen deity Hertha or Nerthus, referred to by Tacitus.
On Arcona in Wittow are the remains of an ancient fortress, enclosing
a temple which was destroyed in 1668 by the Danish commissioners
who made him master of the island. Rügen was ruled then
by a succession of native princes, under Danish supremacy, until
1218. After being for a century and a half in the possession of a
buchi, the island was united with Rügen in 1668, and united in
1884 with that duchy in 1748, and passed with it into the possession
of Sweden in 1648. With the rest of Western Pomerania Rügen has
belonged to Prussia since 1815.

Ruhla, a town of Germany, partly in the duchy of Saxe-
Weimar and partly in that of Saxe-Coburg-Gotha. Pop. (1905)
7017. It stretches along the valley of the Erb in the Thuringian
forest 8 m. S. of Eisenach, and attracts a number of visitors
owed to its beautiful natural surroundings and its mineral
springs. Its staple industry is the making of wooden
and meerschaum pipes; it has also electrical works, and some
small manufactures. Ruhla, which is known locally as Die
Ruhla, was famous in the middle ages for its armourers,
and subsequently for its cutlers.

See Ziegler, Das Thüringerwald oder Ruhla (Dresden, 1876).

Ruhnenken, David (1723-1798), one of the most illustrious
scholars of the Netherlands, was of German origin, having been
born in Pomerania in 1723. His parents had him educated for
the church, but after two years at the university of Wittenberg
he determined to live the life of a scholar. At Wittenberg
Ruhnenken lived in close intimacy with the two most distinguished
professors, Ritter and Berger. To them he owed a thorough
grounding in ancient history and Roman antiquities and
literature; and from them he learned a pure and vivid Latin style.
At Wittenberg, too, Ruhnenken derived valuable mental training
from study in mathematics and Roman law. Probably nothing
would have severed him from his surroundings there but a
desire which daily grew upon him to explore the incrusting recedes
of Greek literature. Neither at Wittenberg nor at any other
German university was Greek in that age seriously studied.
It was taught in the main to students in divinity for the sake of
the Greek Testament and the early fathers of the church.
F. A. Wolf, however, received the Greek scholarship in modern Germany,
and Porson's gibe that "Greeks in Greece are so sadly
seeking" was barbed with truth. It is significant of the state of
Hellenic studies in Germany in 1743 that their leading exponents
were Gesner and Ernst. Ruhnenken was well advised by his
friends at Wittenberg to seek the university of Leiden, where,
stimulated by the influence of Bentley, the great scholar Tiberius
Hemsterhuis had founded the only real school of Greek learning
which had existed on the Continent since the days of Joseph
Scaliger and Isaac Casaubon.
RUHR—RUIZ

Perhaps no two men of letters ever lived in closer friendship than Hemsterhuis and Ruhnken during the twenty-three years which followed Ruhnken's arrival in the Netherlands in 1743 to the death of Hemsterhuis in 1766. A few years made it clear that Ruhnken and Valkenaer were the two pupils of the great master on whom his inheritance must devolve. As his reputation spread, many efforts were made to attract Ruhnken back to Germany, but after settling in Leiden, he only left the country once, when he spent a year in Paris, ransacking the public libraries (1753). For work achieved, this year of Ruhnken may compare even with the famous year which Ritschl spent in Italy. In 1757 Ruhnken was appointed lecturer in Greek, to assist Hemsterhuis, and in 1761 he succeeded Ouden-dorp, with the title of "ordinary professor of history and eloquence," but practically as Latin professor. This promotion drew on him the enmity of some native Netherlanders, who deemed themselves (not without some show of reason) to possess stronger claims for a chair of Latin. The only defence made by Ruhnken was to publish works on Latin literature which eclipsed and silenced his rivals. In 1760 Valkenaer succeeded Hemsterhuis in the Greek chair. The intimacy between the two colleagues was only broken by Valkenaer's death in 1785, and stood without strain the test of common candor for the office (an important one at Leiden) of university librarian, in which Ruhnken was successful. Ruhnken's later years were clouded by severe domestic misfortune, and by the political commotions which, after the outbreak of the war with England in 1780, troubled the Netherlands without ceasing, and threatened to extinguish the university of Leiden. He died in 1798.

Personally, Ruhnken was as far as possible removed from being a recluse or a pedant. He had a well-knit and even hand-some frame, attractive manners (though sometimes tinged with irony), and a nature simple and healthy, and open to impressions from all sides. Fond of society, he never cared little to what rank his associates belonged, if they were genuine men in whom he might find something to learn. His biographer says of him in his early days that he knew how to sacrifice to the Sirens without proving traitor to the Muse. Life in the open air had a great attraction for him; he was fond of sport, and would sometimes devote to it two or three days in the week. In his bearing towards other scholars Ruhnken was generous and dignified, distributing literary aid with a free hand, and meeting onslaughts for the most part with a smile. In the records of learning he occupies an important position. He forms a principal link in the chain which connects Bentley with the modern scholarship of the Continent. The spirit and the aims of Hemsterhuis, the great reviver of Continental learning, were committed to his trust, and were faithfully maintained. He greatly widened the circle of those who valued taste and precision in classical scholarship. He powerfully aided the emancipation of Greek studies from theology; nor must it be forgotten that he first in modern times printed the Platonic Dialogues and the oratorical works of Greek philosophy. His editions of Plato, the salient works of the professed philosophers—men presumptuous enough to interpret the ancient sage with little or no knowledge of the language in which he wrote.

Ruhnken's principal works are editions of (1) Timaeus's Lexicon of Platonic Words, (2) Thadeus and other Greek commentators on Roman law, (3) Rutilius Lupus and other grammarians, (4) Velleius Paterculus, (5) the works of Muretus. He also occupied himself with the history of the Latin tongue from the Latin and Roman grammarians and rhetoricians. A discovery famous in its time was that in the text of the works of Apianus on rhetoric a large piece of a work by Longinus was embedded. Modern views of the writings attributed to Longinus have lessened the interest of this discovery without lessening its merit. The biography of Ruhnken was written by his great pupil, Wytenbach, soon after his death. (J. S. R.)

RUHR, a river of Germany, an important right-bank tributary of the lower Rhine. It rises on the north side of the Winterberg in the Sauerland, at a height of about 2000 ft. above the sea. It first takes a northerly and north-westerly course, and in a deep and well-wooded valley winds past the romantically situated town of Arnsberg. Shortly after reaching Neheim it bends to the south-west, courses through the mining district around Hagen, and receives from the left the waters of the Lenne. Hence in a tortuous course it works its way past Witten, Steele, Kettwig and Mülheim, and, after a course of 142 m., discharges itself into the Rhine at Ruhort. From this place the Rhur canal connects it with Duisburg. The river is navigable from Witten downwards (43 m.), by the aid of eleven locks; but navigation is often greatly impeded through dearth of water.

RUHRORT, a town of Germany, in the Prussian Rhine province, situated at the junction of the Ruhr and the Rhine, in the midst of a productive coal district, 15 m. N. of Düsseldorf and 12 E. of Crefeld by rail. Ruhort has the largest river harbour in Europe, with quays extending nearly 5 m. along the river, and it is the principal shipping port for the coal of the Westphalian coalfield, which is dispatched in the fleet of steam-tugs and barges belonging to the port. The coal is sent principally to South Germany and the Netherlands. Grain and timber are also exported and iron ore is imported. In 1905 the port was entered and cleared by over 27,000 vessels of 74,182,655 tons. The industries of the town include large iron and steel works, ship-building yards and tanneries. Ruhort has three Evangelical and three Roman Catholic churches, and several schools and public institutions.

Ruhort is first mentioned in 1370, and obtained civic rights in 1531. Having been in the possession of the counts of La Marck, it passed into that of Brandenburg in 1714. In 1905 it was united with Duisburg and Meiderich to form a single municipality, the joint population being 41,416.

See Geschichte der Stadt Ruhort (Ruhort, 1882).

RUIZ, JUAN (c. 1283-c. 1350), Spanish poet, was born probably at Alcalá de Henares, and became arch-priest of Hita. Though he draws his physical portrait in the Libro de buen amor, he gives no exact biographical details. It may be inferred from his writings that he was not an exemplary priest, and one of the manuscript copies of his poems states that he was imprisoned by order of Gil Albornoz, archbishop of Toledo. It is not known whether he was sentenced for his irregularities of conduct, or on account of his satirical reflections on his ecclesiastical superiors. Nor is it possible to fix the precise date of his imprisonment. Albornoz nominally occupied the see of Toledo from 1337 to 1368, but he fell into disgrace in 1351 and fled to Avignon.

A consideration of these circumstances points to the probable conclusion that Ruiz was in prison from 1337 to 1350, but this is conjecture. What seems established is that he finished the Libro de buen amor in 1343 while in gaol, and that he was no longer arch-priest of Hita in January 1351; it is assumed that he died shortly before the latter date.

Ruiz is by far the most eminent poet of medieval Spain. His natural gifts were supplemented by his varied culture; he clearly had a considerable knowledge of colloquial (and perhaps of literary) Arabic; his classical reading was apparently not extensive, for he was well-versed in the Disciplina clericalis, and admits his indebtedness to Ovid and the De Amore ascribed to Pamphilus; his references to Blancheufer, to Tristan and to Yseult, indicate an acquaintance with French literature, and he utilizes the fabliaux with remarkable deftness; lastly, he adapts fables and apologues from Aesop, from Pedro Alfonso's Disciplina clericalis, and from medieval bestiaries. All these heterogeneous materials are fused in the substance of his versified autobiography, into which he intercalates devout songs, parodies of epic or forensic formulae, and lyrical digressions on every aspect of life. Ruiz, in fact, offers a complete picture of picareseque society in Spain during the first half of the 14th century, and his impartial irony lends a deeper tone to his rich colouring. He knows the weaknesses of both clergy and laity, and he dwells with equal complacency on the amorous adventures of great ladies, on the perverse intrigues arranged by demure nuns behind their convent walls, and on the simpler instinctive animalism of country lassies and Moorish dancing-girls. In addition to the faculty of genial observation Ruiz has the gift of creating characters and presenting types of human nature: from his Don Furón is derived
the hungry gentleman in *Lasarillo de Tormes*, in Don Melón and Doña Endrina he anticipates Calisto and Melibea in the *Celestina* and Celestina herself is developed from Ruiz Trotaconventos. Moreover, Ruiz was justly proud of his metrical innovations. The *Libro de buen amor* is mainly written in the cuaderna vie modelled on the French alexandrine, but he imparts to the measure a variety and rapidity previously unknown in Spanish, and he experiments by introducing internal rhymes or by shortening the fourth line into an octosyllabic verse; or he boldly recasts the form of the stanza, extending it to six or seven lines with alternate verses of eight and five syllables. But his technical skill never sinks to triviality. All his writing bears the stamp of a unique personality, and, if he never attempts a sublime flight, he conveys with contagious force his enthusiasm for life under any conditions—in town, country, vagabondage or gaol.

His influence is visible in *El Corbacho*, the work of another jovial gothic, Alphonso Martinez de Toledo, arch-priest of Talavera, who wrote more than half a century before the *Libro de buen amor* was imitated by the author of the *Celestina*. Ruiz is mentioned with respect by Santillana, and that his reputation extended beyond Spain is proved by the surviving fragments of a Portuguese version of the *Libro de buen amor*. By some strange accident he was overlooked, and apparently forgotten till 1790, when an expanded edition of his poems, compiled by Tomás Antonio Sánchez; from that date his fame has steadily increased, and by the unanimous verdict of all competent judges he is now ranked as the greatest Spanish poet of his century.

An accurate edition of his works was published by M. Jean Ducamin at Toulouse in 1901, and he is the subject of Sr. D. Julio Puyol y Alonso's critical study, El *Arcipreste de Hita* (Madrid, 1906).

**RUKWA—RULLUS**

(RUKWA (sometimes also Rikwa and Hikwa), a shallow lake in German East Africa, lying 2500 ft. above the sea in a N.W. continuation of the rift-valley which contains Lake Nyassa. The sides of the valley here run in steep parallel walls 30 to 40 m. apart, from S.E. to N.W., leaving between them a level plain extending from about 7° 30' to 8° 30' S. This whole area was probably once covered by the lake, but this has shrunk so that the permanent water occupies only a space of 30 m. by 12 at the S. immediately under the E. escarpment. In the rains it extends some 40 m. farther N., and the north of the plain is likewise then covered with water to a depth of about 4 ft. The rest of the plain is a bare expanse intensely heated by the sun in the dry season, and forming a tract of foul mud near the lake shores. But in 1903–4 the level of the lake rose so that the waters covered the whole depression. The lake has two large feeders, one coming from the W., the other from the S.E. The W. feeder, the Saiisi, or Momba, rises in 8° 50' S., 31° 10' E., and traverses a winding valley cut out of the high plateau between lakes Nyassa and Tanganyika. It enters the lake on its N.W. side. The other chief feeder, the Songwe, rises in 6° 8' S., 35° 30' E. on the same plateau as the Saiisi and flows N.W., entering Rukwa at its S. end. The Songwe is joined about 30 m. about its mouth by the Rupa, whose head-waters are in the high-laying land N.E. of Rukwa. The maximum depth of the lake is about 60 ft. Its waters are very brackish, and when the wind blows from the lake, it is stirred up by the wind. It contains great quantities of fish. First seen from the north by Joseph Thomson in 1880, it was visited by Dr. Kaiser, a German, in 1882, and has since been thoroughly explored by various British and German travellers. See "Begleitworte zu der Karte der Gebiete am südlichen Tanganjika- und Rukwa-See," by Paul Sprigade, in Mitteil, v. Forsch. u. Gelehrten a. d. deutschen Schutzgebieten (Berlin, 1904), with map on the scale of 1:500,000.

**RULHIÈRE (or RULHIERE), CLAUDE CARLOMAN DE (1735–1791).** French poet and historian, was born at Bondy, near Lille, on 12th of June 1735. He became aide-de-camp to Marshal Richelieu, whom he followed through the Hanoverian campaign of 1757 and to his government at Bordeaux in 1758; and at twenty-five he was sent to St Petersburg as secretary of legation. Here he actually saw the revolution which seated Catherine II. on the throne, and thus obtained the facts of *Anecdotes sur la révolution de Russie en 1762*. Catherine made concerted efforts to secure the destruction of the MS., which remained unpublished until after the empress's death. Rulhière became secretary to the comte de Provence (afterwards Louis XVIII.) in 1773, and he was admitted to the Academy in 1787. The later years of his life were spent chiefly in Paris, where he held an appointment in the Foreign Office and went much into society; but he visited Germany and Poland in 1776. His unfinished *Histoire de l'anarchie de Pologne* (4 vols., 1807) was published posthumously under the editorship of P. C. F. Daunou. The only important historical work which he published during his lifetime was his *Éclaircissements historiques sur les causes de la révolution de l'édit de Nantes...* (2 vols., 1788), undertaken in view of the restoration to the Protestants of their civil rights. Rulhière died at Bondy on the 30th of January 1791.

His short sketch of the Russian revolution is justly ranked among the masterpieces of the kind in French. Of the larger Poland Carlyle, as justly, complains that its allowance of fact is too small in proportion to its bulk. The author was also a fertile writer of vers de société, short satires, epigrams, &c., and he had a considerable reputation among the witty and cultivated group of his time containing Nicolas Chomfort, Antoine de Rivarol, Louis Stanislas Cabanel, &c. Of the other hand he has the credit of caring for J. J. Rousseau in his morose old age, until Rousseau as usual quarrelled with him.

Rulhière's works were edited, with a notice by P. R. Angius, in 1819 (Paris, 6 vols. 8vo). The *Russian Revolution* may be found in the *Chefs-d'œuvre historiques* of the Collection Didot, and the *Poland*, with title altered to *Révolutions de Pologne*, in the same collection. See also a notice by Eugène Asse prefixed to an edition (1890) of Rulhière's *Anecdotes sur le Maréchal de Richelet*: *Sociëte, Causes de la lundi* (vol. iv.).

**RULLUS, PUBLIUS SERVILIUS,** Roman tribune of the people in 64 B.C., well known as the proposer of one of the most far-reaching agrarian laws brought forward in Roman history. This law provided for the establishment of a commission of ten, empowered to purchase land in Italy for distribution amongst the poorer citizens and for the foundation of colonies. Its proposed object was to clear Rome of the large number of pauper citizens, who formed a standing menace to peace. The members of the commission were to be invested with powers so extensive that Cicero spoke of them as ten "kings." They were to be elected for five years by the tribunes chosen by lot from the thirty-five; the imperium was to be conferred upon them for life, together with judicial power, and the rank of praetor. Only those were eligible who personally gave in their names, a clause obviously intended to exclude Pompey, who was at the time absent in the East. In fact, the commission as a whole was intended to act as a counterpoise to his power. The only land available for the purposes of the bill was the Ager Campanus and the Ager Stellati, where 5000 citizens were to be settled at once, but as these were utterly insufficient, other lands were to be acquired by purchase. The necessary money was to be found by the sale of all the public property in Italy which had been ordered to be sold by resolutions of the senate (in 81, or subsequently), but which the fear of unpopularity had deterred the consuls from selling; by the sale of lands, &c., in the provinces which had become public property since 88, and even of the domains acquired during the Mithradatic war. A special article, the object of which was to satisfy those who had received grants of land from Sulla, declared such possessions to be private property, for which compensation was to be paid in case of surrender. The revenues of the provinces which were now being organized by Pompey, and the taxes and money taken or required by generals during war were also to be also be paid to this purpose. The places in which colonies were to be sent were not specified (with the exception mentioned above), so that the commissioners would be able to sell wherever they pleased, and it was left to them to decide what was public or private property.
RUM—RUMANIA

Cicero delivered four speeches against the bill, of which three are still extant, although the first is mutilated at the beginning. The second is the most important for the history of the bill; nothing is known of the fourth. Very little enthusiasm was shown in the matter by the people, who preferred the distribution of doles in the city to the prospect of distant allotments. One of the tribunes even threatened to put his veto on the bill, which was withdrawn before the voting took place. The whole affair was obviously a political move, probably engineered by Caesar, his object being to make the democratic leaders the rulers of the state. Although Caesar could hardly have expected the bill to pass, the aristocratic party would be saddled with the odium of rejecting a popular measure, and the people themselves would be more ready to welcome a proposal by Caesar himself, an expectation fulfilled by the passing of the lex Julia in 58, whereby Caesar at least partly succeeded where Rullus had failed.

See the orations of Cicero De lege expraria, with the introduction in G. Long’s edition, and the same author’s Decline of the Roman Republic, p. 241; Mommsen, Hist. of Rome, bk. v. ch. 5; art. Agrarian Laws.

RUM, or Roum (Arab. ar-Ra‘m), a very indefinite term in use among Mahomedans at different dates for Europeans generally and for the Byzantine empire in particular; at one time even for the Seljuk empire in Asia Minor, and now for Greeks inhabiting the Ottoman territory. When the Arabs met the Byzantine Greeks, these called themselves Pe*ma output, or Romans, a reminiscence of the Roman conquest and of the founding of the new Rome at Byzantium. The Arabs, therefore, called them “the Rum” as a race-name (already in Kor. xxx. 1), their territory “the land of the Rumi,” and the Mediterranean “the Sea of the Rumi.” The original ancient Greeks they called “Yunant” (Ionians), the ancient Romans, “Rum” and sometimes “La†n†yn” (Latinis). Later, inasmuch as Muslim contact with the Byzantine Greeks was in Asia Minor, the term Rum became fixed there geographically and remained even after the conquest by the Seljuk Turks, so that their territory was called the land of the Seljuks of Rum. But as the Mediterranean was “the Sea of the Rum,” so all peoples on its N. coast were called sweeningly “the Rum.” In Spain any Christian slave-girl who had embraced Islam was named Rumiya, and we find the crew of a Genoese vessel being called Romans by a muslim traveller. The crusades introduced the Franks (Ifranjania), and later Arabic writers recognize them and their civilization on the N. shore of the Mediterranean W. from Rome; so Ibn Khalidun in the latter part of the 14th century. But Rumi is still used in Morocco for a Christian or European in general, instead of the now elsewhere commoner Ifranjan (D. B. Ma.).

RUM (according to Skat, a corruption of Malay brum or bream; the adjective “rum,” i.e. “queer,” being a distinct word, in Gipsy rum), a potable spirit distilled chiefly from fermented cane-sugar. It is mainly the produce of the West Indian Islands, notably Jamaica, and of Demerara. There are two kinds of Jamaica rum, namely, “common” or “clean” rum, and “flavoured” or “German” rum. The latter is used almost entirely for purposes of blending with lighter types of spirit. Compared with other potable spirits such as whisky and brandy, the Jamaican rums are distinguished by their very high proportion of secondary products, particularly of the compound ethyl butyrate.

Among the latter butyric “ether” (ethyl butyrate) predominates. The Demerara rums are of a lighter character. Rum has a deep brown colour imparted by caramel or by storage in sherry casks, or, most generally, by both. “Tafia” is an inferior quality of rum produced in the French colonies. “Negro” rum, which is the lowest quality of all, and into the wash for which the debris of the sugar-cane enters, is consumed locally by the coloured workers. The spirit prepared from beet-sugar molasses cannot be regarded as rum, for, unless it is highly rectified, it possesses a disagreeable odour and taste. Fictitious rum is, however, sometimes prepared from highly rectified beet spirit and rum “essence”—a mixture of artificial esters (ethyl butyrate, &c.)—bird bark oil and so on. Highly rectified beet spirit is also occasionally used for blending with genuine rum, particularly with the “flavoured” or “German” rum. Rum has been originated in the fact that this kind of rum was exported very largely to Germany for the purpose of blending. The general composition of various kinds of rum is manifest from the annexed table. The consumption of rum in the United Kingdom has fallen off considerably of late years, concurrently with the general tendency of the public towards lighter and “drier” alcoholic beverages (see Spirits).

Composition of Different Varieties of Rum
(Analyses by W. Collingwood Williams; cf. J. Soc. Chem. Ind. 1907, p. 498.)

RUMANIA, or Roumania (România), a kingdom of southeastern Europe, situated to the north-east of the Balkan Peninsula,1 on the Black Sea. Pop. (1910, estimate) 6,850,000; area, about 50,720, sq. m., or about 6500 sq. m. less than the combined areas of England and Wales. Rumania begins on the seaward side with a band of territory called the Dobrudja (q.v.) and broadens westward into the form of a blunted crescent, its northern horn being called Moldavia, its southern Walachia.

Physical Features.—Along the inner side of this crescent lies the Carpathian Mountains, also called, towards their western extremity, the Transylvanian Mountains (q.v.) or Transylvanian Alps, and the frontier which marks off Rumania from Hungary is drawn along their crest. The eastern boundary is formed by the river Pruth (Prut) between Moldavia and Russia; farther south by the Kilia mouth of the Danube (Dunav), between the Dobrudja and Russia, and by the Black Sea. In the extreme southeast, an irregular line, traced from Ilanlci, 10 m. S. of Mangalia, on the coast, as far as Danube at Silistra, 85 m. inland, separates the Dobrudja from Bulgaria. Further southwards, the Transylvanian Mountains, which vary from 1000 to 2000 ft. in height, and are covered by birches and pines. In this neighbourhood the channel contracts to about 116 yds. in width, with a depth of 30 fathoms. At the eastern end of the pass are the celebrated Iron Gates, a rapid so named by the Turks, not from the surrounding heights, which here descend gradually to the river, but from the number of submerged rocks in the waterway. As it flows eastward from the frontier, the Danube gains in breadth and volume; Islands are frequent; the banks recede and become lower until, after 50 m., they stand almost level with the water. Henceforward, for 290 m., the Rumanian shore is a desolate fen-country, varied only by a few hills, by lakes, and by narrow and shallow inlets. In the bend south of 45 m. At Silistra the river bends N.N.E. for 110 m. with the Dobrudja on its right, and a barren plain, called the Baragan Steppe, on its left. Here it encloses two large swampy islands, the upper being 57 m. the lower 46 m. in breadth, at a distance of 10 m. Beyond Galatz, the river again turns eastward, branching out, near Tulcea, into three great waterways, which wind through an extremely low alluvial delta to the sea. The northern estuary is named the Kilia Mouth; the central, the Sulina; the southern, the St George’s. Between Verciorova and the Sulina Mouth, the Danube traverses 540 m. Its current is rapid, and supplies the motive

1 In 1904, in a lecture read before the Rumanian Geographical Society, M. A. Sturdza showed that Rumania should not be included in the Balkan Peninsula, where it is placed by many writers and cartographers. This view was accepted by the Society, and a copy of the lecture was forwarded to all similar societies in Europe. Sec A. Sturdza, La Roumanie n’appartient pas à la péninsule balkanique (Bucharest, 1904).

2 I.e. Cauldron.
power for thousands of floating watermills, which lie moored in the shallows. It is fed by many tributaries, which rise in the Carpathians as mountain torrents, growing broad and sluggish as they flow south-eastward through the central Rumanian plain. In Walachia, it is joined by the Jiu (of Schyl) opposite Râhova; by the Olt (or Oïla) at Turnu Magurele; by the united streams of the Dimbovita (Dâmbovita) and Argesh (Arges) at Oltenita; by the Jalomita (Jalomița) opposite Hârsova. The Olt pierces the Carpathians, by way of the Rothenburd Pass, and forms the boundary of Little (i.e. western) Moldavia, or Oltenia. The Sereth (Siretu or Siretû) flows for about 340 m. from its Transylvanian source through Moldavia, and meets the Danube near Galatz, after receiving the Moldova, Bistritsa (Bistrîța), Trotosch (Trotosâ), Moldovia, Portion, Râmnic and Buzău on the west; and the Bâlîadi (Bîlăadi) on the east. The Milcov on was the former boundary between Walachia and Moldavia. The Pruth rises on the northern limit of Moldavia, forms the eastern frontier for 330 m., and falls into the Danube at E. of Galatz. Its chief Rumanian tributaries are the Basheu (Bâșeul) and Iljia, rivers of the north. The Dobrudja (g.v.) or Dobrogea covers about 2900 sq. m. between the Black Sea and the lower reaches of the Danube. Its high crystalline rocks, covered with sedimentary formations, descend abruptly towards the delta, but more gradually towards the south, where the Bulgarian steppes encroach upon Rumanian soil. The few small rivers which drain the hills generally flow seaward, but those of the delta and steppes belong to the Danubian system. The coast is a low-lying region of sandhills, mires and marshes with one lagoon, 42 m. long, connected by a short stream with the St. George Mound. Its outlet on the sea is named the Portulac Mound (Gara portulâc) of the Danube. North of this, that part of the delta seen from Lake Razin; while its southern half, shut off by three long islands, is the Blue Lake (Sino Ostîre, in Bulgarian). Apart from the Dobrudja, the whole of Rumania is included in the northern basin of the lower Danube. It consists of a single inclined plane stretching upwards, with a north-westly direction, from the left bank of the river to the summits of the Carpathians. It is divided into three zones—steppe, forest and alpine. The first begins beyond the mud-flats and reed-beds which line the water's edge, and is a vast monotonous lowland, sloping so gently as to seem almost level. The surface is a yellow clay, with patches of brown or dark grey, outliers of the Russian "black earth." Cereals, chiefly maize; with green crops and fields of gourds, alternate with fallow land overgrown by coarse grasses, weeds and stunted shrubs. Among the scanty trees, willows and poplars are commonest. The second zone extends over the foothills and lower ridges of the Carpathians. This region, called by Rumanians "the district of vines," is the most fertile portion of the country. It in grows most fruits and flowers which thrive in a temperate climate. Oaks, elms, firs, ashes and beeches are the principal forest trees. The third zone covers the higher mountains on their southern and eastern sides, where violently contorted strata leave many transverse valleys, though usually inclining laterally towards the south-east. The birch and larch woods of this zone give way to pine forests as the altitude increases; and the pines to mosses, fichens and alpine plants, just below the jagged iron-grey peaks, many of which attain altitudes of 6000 to 8000 ft.

Geology.—The axis of the Transylvanian Alps consists of sericite schists and other similar rocks; and these are followed on the south by Jurassic, Cretaceous and Early Tertiary beds. The Jurassic and Cretaceous beds are ordinary marine sediments, but from the Cenomanian to the Oligocene the deposits are of the peculiar facies known in the Alps and Carpathians as Flysch. Further north, the Flysch forms practically the whole of the Rumanian flank of the Carpathians. Along the foot of the Carpathians lies a broad trough of Miocene sediments, and in this trough the strata are sometimes horizontal and sometimes strongly folded. Outside the bed of Miocene beds the Sarmatian, Pontian and Levantine series, often concealed by Quaternary deposits, cover the greater part of the Danube plain. Even the Pontian beds are sometimes folded. In the Dobrudja crystalline rocks, presumably of ancient date, rise through the Tertiary and recent deposits and form the hills which lie between the Danube and the Black Sea.

Climate.—The Rumanian climate alternates between extreme cold in winter, when the thermometer may fall to -20° Fahrenheit and extreme heat in summer, when it may rise to 100° in the shade. Spring is the mildest season; spring lasts only for a few weeks. Spring at Bucharest has a mean temperature of 53°; summer,
72.5°, autumn, 65°, winter, 27.5°. For about 155 days in each year, Rumania suffers from the bitter north-east wind (criets) which sweeps over south Russia; while a scorching west or south-west wind (austri) blows for about 126 days. Little snow falls in the north, but it is abundant along the mountains it may lie for five months. The frosts are severe, the Danube being often iced over for three months. The rainfall, which is heaviest in summer, averages about 15-20 in.

Fauna. In its fauna, Walachia has far more affinity to the lands lying to the north of the Danube than to Transylvania, although several species of Claudius, once regarded as exclusively Transylvanian, are found south of the Carpathians. Moldavia and the Baragan steppe resemble the Russian prairies in their variety of molluscs and the mussels (Unioidea) have been observed in the Rumanian rivers. The lakes of the Dobrudja likewise abound in molluscs; parent forms, in many cases, of species which reappear, greatly modified, in the seas of the world. Agriculture. The favourite genus of Orthoptera (Jaquetia Hospodar) has several species of weevils (Curculionidae) said to be peculiar to Rumania. Birds are very numerous, including no fewer than 20 varieties of crow, 5 of warblers, 7 of woodpeckers, 8 of ducks; 4 of falcons and 5 of eagles, while among the hosts of waterfowl which people the marshes of the Danube there are many varieties of ducks and of geese. Roe-deer, foxes and wolves find shelter in the forests, where bears are not uncommon; and chamois frequent the hillsides of Hâlmea. Minerals. The mineral wealth of Rumania lies chiefly in the mountains. Petroleum, salt, lignite and brown coal are largely worked. Deposits of rock-salt, a valuable government monopoly, extend on both sides of the Onetus, and the salt taken there is sent to the ports of the Black Sea. The barium deposits of Turculi, and those of many other metals, including nickel, have been worked. The copper mines of the mountains near the Danube and the Baragan steppe, with the mountain pastures of the Arges, Buzau, Dimbovita, Muscel and Prahova, are occupied by large sheep-runs; 1200 farms were created in the Baragan steppe, with a sheep population of 1,300,000, the herds coming from the highlands to the plains. Cheeses of ewe's milk, packed in sheepskins or bark, are in great demand. Swine and pork are largely exported to Russia and Austria-Hungary. Besides the Meteor mine at Cluj, there are large deposits of coal in the Prahova department; thousands of so-called "swine-hogs" run wild among the marshes and on the islands of the Danube. Silkworm-rearing, once an important household industry, had been almost abandoned when, in 1891, the government established the first silkworm farm in the country. The chief province for silkworm-rearing is taught in the monasteries and agricultural schools, especially in the College of Agriculture and Sylviiculture at Ferești, near Bucharest. Similar measures were adopted to the Colonies of Oltenia, and a model apiary was founded in 1806, under the government control.

Agriculture. The forests of Rumania were long either neglected or exploited in the most reckless fashion. Large tracts of woodland were cleared near the railways, and the communal rights of grazing and hunting were ill-defined. By 1890, when the Germanization of the eastern counties began, there was little woodland left. By 1910 there were 2,750,000 acres under forests, chiefly in the mountains of north-western Moldavia. More than 1,000,000 acres are state property. Under King Charles, an ardent forestier, the woods were exploited in a way which met with success. Lumber is floated down the rivers of the Carpathian watershed to the Danube, and so exported to Turkey and Bulgaria; casks, shaped planks and petroleum drums go chiefly by the Danube and the Olt to the Black Sea. A special school of forestry exists at Brănișca in the Ilfov department. Estates in private hands are liable to state control, under the Forests Act of 1886.

The system of land tenure dates from 1864, when most of the land was held in large estates, owned privately, or by the state or by monasteries. There was also a small class of peasant proprietors, called moșteni, in Walachia, țeștei, Transylvania, Transylvania, and Moldavia, but the great mass of the peasantry cultivated the lands of the large proprietors, giving a certain number of days' work to their manorial lord, in addition to a tithe of the raw produce. They received in return a plot of ground proportionate to the number of animals they owned. The system worked reasonably well, but in 1864 and a special school of forestry exists at Brănișca in the Ilfov department.

1 The relative importance of Rumania was afterwards lessened by the development of wheat-culture in Canada, Argentina and elsewhere.
extent benefit the peasantry. The limited size of their farms, and the necessity for buying wood and paying for pasturage, both of which were formerly free, prevented them from obtaining complete independence of the large proprietors, on whose estates they still had to till the ground for payment of rent, while their lands were soon got them into the hands of Jewish money-lenders, who, fortunately for the peasants, were by law unable to become proprietors of the soil. In 1866 and 1872 laws were passed for still further improving the condition of the peasants, and in 1875 a law was passed for allotting lands to 48,000 recently married couples, and for restoring to many peasant families lands which had been alienated.

By an Act of 1898, the state domains, amounting to nearly one-third of the total area of Rumania (originally the property of the church and the convents, confiscated by Prince Cuza in 1866), were distributed among the peasantry. The land was divided into lots of 12½, 25 and 37½ acres. Peasants having no land might purchase the lots they desired, but the land of those who already owned more than 12½ acres might purchase up to that amount. When a change of residence became necessary to enable the peasant to take up the new allotment, the state advanced £6 to each family to defray expenses. The price to be paid for the land differed in different districts, and was to be paid to the state in small annual instalments. If any land remained after satisfying the wants of the peasants, it was to be sold by public auction in lots of 50 to 62½ acres. All lots in both cases were declared inalienable for thirty years; after the sale of the larger lots gave rise to so many abuses that in 1896 a law was passed abolishing their further sale. As a result of these measures the majority of Rumanians are peasant proprietors; but the smallness of the holdings, the low valuation, the difficulty of cultivating and operating, and the many proprietors can only live by working for the owners of large estates. Thus, though the average value of agricultural land increased by 60% between 1870 and 1900, the position of the peasantry is far from satisfactory, and the resultant discontent, to the great injury of the agricultural interest.

Fisheries.—Among European freshwater fishing-grounds, the Danube is only surpassed by the Volga: the most valuable fish being sturgeon and sterlet, mostly netted in the St George mouth; carp, often weighing 50 lb, pike, perch, tench and eels. By an act of 1865, a close period was instituted, the lakes and rivers restocked, and the state fisheries, which are either farmed by private companies or directly administered, were set in order. The coarse-grained grey Rumanian sturgeon is forwarded fresh or salted and dressed with Russian caviare. Flounders and mullets are caught in the Black Sea, and there are oyster-beds in the delta and on the Dobrudja littoral. The principal markets for Rumanian fish are Turkey, Russia, and Austro-Hungary. Fish of inferior quality is imported, chiefly from Russia.

Manufactures and Commerce.—The native mines, fish and forests provide raw material for most of the few factories which exist; cases include petroleum refinery for their countries, distilleries, flour mills, sugar refineries, sawmills, paper mills, chemical works, glass works, soap and candle works, &c. A law passed in 1887 provided that any undertaking to found an industrial establishment in the state at least one-third of the capital at least five years' employment at least 25 workers of whom two-thirds should be Rumanian, shall be granted 12½ acres of state land, exemption for a term of years from all direct taxes, freedom from customs dues for machinery and raw materials imported, exemption from road taxes, reduction in cost of transportation of materials on the state railways, and preferential rights to the supply of manufactured articles to the state.

The following table shows the value of Rumanian imports and exports for five years—

<table>
<thead>
<tr>

</tbody>
</table>

The principal imports are metals and machinery (£5,510,000 in 1908), textiles, silk, wool, hair and hides. Grain (£1,267,000 in 1908),, sugar, butter, coffee, sugar and tobacco are all important; the most important exports, the remainder consisting of live-stock and animal products, fruit, vegetables and mineral waters. In 1908 the chief consumers of Rumanian goods were (in order) Belgium, Germany, Austria-Hungary, Great Britain and France. The wide fluctuations in Rumanian commerce are largely due to the dependence of the country on the grain harvest.

The following table shows the estimated revenue and expenditure for five years—

</table>

The great increase after 1907-8 is due to the inclusion of railway receipts and expenditure, with some other items not previously enumerated.

In May 1905 the outstanding public debt, which amounted to about £5,000,000 in 1885 (equal to £1,400,000), grew to £28,376,000 in 1911, and the debt charges for the year were estimated at £3,518,080.

Banks and Currency.—Apart from the General Bank of Rumania (capital £1,500,000), which is owned by a syndicate of tradesmen, the largest credit establishments belong to the state. They include the National Bank (capital and reserves in 1910, £1,560,000), founded in 1880; the Agricultural Loan Bank, founded in 1864; the Rural and Urban Credit and Insurance institute, which administers agricultural and building land respectively: the Cassa Rulaula, which buys estates for resale in small lots; savings banks in all the principal towns; and the Deposit and Trust Fund, which takes care of estates left to workmen through intestacy, surplus deposit banks, and communal funds, securities given by contractors for public works, &c.

After the Crimean War, a bimetalllic currency was adopted, with the silver (2½) of 100 bani (centimes) as the unit of value. But after 1878 the Rumanian money (aranz, 8 bani = £1) was mainly used in the province. The native coins are issued in circulation; and in 1889 Rumania joined the Latin Monetary Union and adopted a gold standard. Besides the silver pieces worth ½, 1, 2 and 5 leu, gold coins of 5, 10 and 20 leu are used. Silver coins issued in 1883 and 1885 were then withdrawn. Leu must be paid in gold, and, owing to the small quantities issued from the Rumanian mint, foreign gold is current, especially French 20 franc pieces (equal at par to 20 leu), Turkish gold lira (22-70), Old Russian 5 and 10 rubles (4 lei) and German 5 Reichs and 10 Marks coins. Besides bronze coins of less value than 3 leu, nickel pieces worth 5, 10 and 20 bani were authorized by a law of 1900. The French decimal system is in use for weights and measures, together with Turkish standards. For the calendar year 1909-10, the Gregorian calendar is employed; elsewhere the Julian remains in use.

Chief Towns.—The chief towns, with their estimated population in 1910, are Bucharest, the capital (300,000); Jassy, the capital of Moldavia (275,000); Constanța (250,000); Craiova (46,000); Botoșani (34,000); Brașov (25,000); Fălticeni (25,000); Tulcea (20,000); Iași (15,000); Giurgiu (15,000). Other towns which, like the foregoing, are described in separate articles are Alexandria, Babadag, Bacău, Buzău, Calafat, Calarasi, Câmpulung, Cernăuți, Curtea de Argeș, Fălticeni, Hîrșu, Mangalia, Neamț, Oltenești, Piatra, Pitești, Râmnicu Sărat, Râmnicu Vâlcei, Roman, Sinaia, Sulina, Târgoviște, Târgu Ocna, Târgu Mureș, Târgu Secuiesc, Vâlcea, Vâșul.

Communications.—Until the 19th century, traffic was carried on in Rumania chiefly by means of ox-wagons, over the roughest of roads. After 1830, however, many highways were opened, these being used by excellent modern coaches drawn by oxen. As they descend into the lowlands, where stone is dear. Highways are maintained by the state, department or commune, according to their size and importance. In 1866, the first Rumanian railway was opened between Bucharest and Brașov, and in 1880, the other lines followed rapidly; some built by private enterprise, others by the state, which by 1888 had bought the entire system. This one in a main line, carried southwards from Suceava in Bukovina through Moldavia, and the other through Transylvania to Germany, Austria-Hungary, Great Britain and France. The wide fluctuations in Rumanian commerce are largely due to the dependence of the country on the grain harvest. The state revenue is derived from customs; from public works and public services; from indirect taxes in the shape of stamp, inheritance, beer, spirit, petroleum and other duties; from direct taxes on land and buildings, with road-tolls, licences for the sale of alcohol and traders' registration fees; from the tobacco, salt, match, playing-card and cigarette-paper monopolies; and from the postal, telegraphic and telephonic services. The chief items of expenditure are interest on the national debt, and the cost of defence, public works and education.
ferries. Rumania has no canals, and the canalization of its rivers is impeded by drought and floods. The Pruth and Sereth are navigable for a short distance by small sailing craft; the conservancy of the Danube (q.v.) is controlled by a European commission, which sits at Galatz. Besides river services, the state maintains lines of sea-going ships from Constantza to Constantinople and the Aegean Islands, and from Braila to Rotterdam. In 1906 the ports of Rumania were entered by 32,888 vessels of 9,266,000 tons, of which 20,500 were belonging to the Danubian trade. The merchant navy of Rumania comprised about 455 vessels of 145,000 tons, including 88 steamers.

Population.—The population of Rumania numbered 5,912,520 in 1899, and about 6,850,000 in 1910. Fully 6,000,000 of these were Rumanians or Vlachs (q.v.). The population of foreign descent comprises many Jews, Armenians, gipsies, Greeks, Germans, Turks, Tatars and Magyars, Servians and Bulgarians. The Jews increase more rapidly than any of these peoples except the Armenians. They usually congregate in the larger towns, though in northern Moldavia there are a few purely Jewish villages, recalling those of Poland.

The gipsies, who are mostly converts to the Orthodox Church, still, as a rule, cling to their vagabond existence, though their skill at handcrafts finds them ready employment in the towns. During their centuries of slavery, they were organized into castes, as musicians, metal workers, masons, &c.; but after about 1850 the bonds of caste were gradually relaxed and gipsies began to intermarry with Rumanians. The Greeks form a floating population of merchants and small traders, anxious to amass a fortune and return home. German and Austrian business men visit the country in large numbers, and colonies of German farmers flourish among the mountains of Little Walachia. In central Moldavia there is a large population of Magyar descent, and the Servian and Bulgarian elements are strong near the Danube. The interior of the Dobrudja is occupied largely by Turks and Bulgarians, with Tatars, Russians and Armenians, but here the Ruman steadily gains ground at the expense of the alien. At Megidia, a flourishing town of about 10,000 inhabitants, which sprang up about 1860 between Cernavoda and Constantza, the Tatars predominate. Russians of the Lipovan sect live in exile in Bucharest and other cities, earning a livelihood as cab-drivers, and wearing the long coats and round caps of their countrymen.

National Characteristics.—Two dissimilar types are noticeable among the Rumanians. One is fair-haired, florid and blue-eyed; the other, more frequent among the Carpathians, is dark, resembling the southern Italians. Both alike are hardy, though rarely tall; both, when of the peasant class, frugal and inured to toil amid the rigours of their native climate. Proud of their race and country, they acquired, with their independence, an ardent sense of nationality; and they look forward to the day which will reunite them to their kindred in Transylvania and Bessarabia. They have been taught, originally in the interests of Transylvanian Roman Catholicism, to regard themselves as true descendants of the Romans. The peasants retain their distinctive dress, long discarded, except on festivals and at court, by the wealthier classes. Men wear a long linen tunic, leather belt, white woollen trousers and leather gaiters, above Turkish slippers or sandals. The lowlanders' head-dress is generally a high cylindrical cap of rough cloth or felt, while the mountaineers prefer a small round straw hat. Sundays and holidays bring out a sleeveless jacket, embroidered in red and gold; and both sexes wear sheepskins in cold weather. The linen dresses of women are fastened by a long sash or girdle, wound many times round the waist: the holiday attire being a white gown covered with embroideries, one or more brightly coloured aprons and necklaces of beads or coins. The standard of comfort is lowest along the Danube and in parts of the Dobrudja. As the land becomes higher, the dwellings improve; but, despite the presence of a doctor in each commune, disease is everywhere rife. Many villages are wholly built of timber and thatch, especially amongst the Carpathians, the floors being frequently raised on piles, several feet above the ground. The inner walls are often hung with hand-woven tapestries, which harmonize well with the smoke-blackened stoves, the primitive lantern and the huge Dutch stove characteristic of a prosperous Hungarian one. Many pagan believers linger on in the country, where vampires, witches and the evil eye are dreaded by all. The peasants reassure themselves by the use of charms and spells, and by a strict observance of the forms which their creed prescribes. A cross guards every well or spring; every home has its tKnown or sacred pictures. Church festivals and fasts are kept with equal care. For months together a Ruman will subsist on vegetables and mamaliga, the maize porridge that forms his staple diet. Beet and mutton are rarely touched, and in some districts pork is only eaten on St Hilary's day (the 20th of December, O.S.). Veal is the one kind of meat generally consumed. Wine and plum-spirit, or the more powerful brandy distilled from grain, are drunk in great quantities by the townsfolk, more sparingly by countrymen; Rumanians generally being more sober than the Western Europeans. The ceremonies which accompany a wedding preserve the tradition of marriage by capture; a peasant bride must enter her new home carrying bread and salt, arranged on plates of silver or gold, and covered with a oil, wall of corned in which there is a girl old enough to marry. Young men swear eternal brotherhood; girls, eternal sisterhood; and the Church ratifies their choice in a service at which the feet of the pair are chained together. This relationship is morally and legally regarded as not less binding than kinship by birth. The dead are borne to the grave with uncovered faces, and a Rumanian funeral is a scene of much barbaric display. All classes delight in music and dancing. Women hold spinning-parties at which the leader begins a ballad, and each in turn contributes a verse. A number of satirical folk-tales (largely of Turkish origin) are current at the expense of Jew, gipsy or parish priest. The Rumanian folk-songs, sung and often improvised by the villagers, or by a wandering guitar-player (cobnar), are of exceptional interest and beauty (see Literature, below). The national dances and music closely resemble those of the Southern Slavs (see Montenegro and Bulgaria).

Constitution.—In 1866, Prince Charles of Hohenzollern-Sigmaringen was chosen as Prince of Rumania by a constituent assembly, elected under universal suffrage. This body at the same time drew up a constitution, which remains in force, though modified in 1879 and 1884. In 1881, Prince Charles was proclaimed king. As he proved childless, the succession was accepted by his brother, Prince Leopold, on behalf of his son William; and in 1888 William renounced his claim in favour of Ferdinand his younger brother. Thus the monarchy became hereditary in the family of Hohenzollern-Sigmaringen. No woman may ascend the throne; and, in default of a male heir, the representatives of the people can choose a king among the royal families of Western Europe.

Parliament consists of a senate, elected for eight years, and
a chamber of deputies, elected for four years. Senators must be forty years old and possess an income of 9,000 leu (£176). They are chosen by two colleges of electors; one composed of citizens with an income of £30; the other, of citizens with incomes varying from £32 to £80. The heir-apparent, the two archbishops, the six bishops and the rectors of both universities, sit ex officio in the senate. For the chamber of deputies, all citizen taxpayers of full age may vote, being organized for the purpose into three colleges. All persons with an income of £50 vote in the first; all residents in an urban commune who pay taxes amounting to sixteen shillings yearly, with those who have passed the primary course of education, and all members of the liberal professions, retired officers and state pensioners, vote in the second. The third college is formed of the remaining taxpayers. Those who can read and write vote directly, the rest indirectly. Every fifty indirect electors choose a delegate, who votes along with the direct electors. The naturalization of Jews and Moslems is hedged with many technical difficulties, and requires a separate vote of the legislature in every individual case. Deputies must be not less than twenty-five years of age. Both senators and deputies receive 20 leu for each day of actual attendance, and travel free on the railways. The king may temporarily veto any measure passed by parliament. Executive power is vested in a council under the presidency of a prime minister, and representing the ministers of foreign affairs; justice; the interior; religion and education; war; finance; agriculture, trade, industry and public domains; and public works. Entire liberty of speech, assembly and press is guaranteed by the constitution, by which also the titles and privileges of the boars or nobles were abolished.

For purposes of local government, Rumania is divided into 32 administrative districts, each controlled by a prefect, and subdivided into 168 arrondissements, each subdivided into 1,339 communes. Each commune is divided into sections. Those elected by the people to form councilors, who with the chief magistrate and certain elected officials constitute the legislative body known as the 'arrondissement.' These sections are divided into three categories according to size. The section proper is the smallest subdivision of the commune, and corresponds with the French arrondissements. Prefects and sub-prefects are appointed by the state, but the chief civic officials are elected. Very heavy octroi duties provide the means of municipal administration.

Law and Justice.—Until the 17th century justice was administered according to custom and precedent, or, in ecclesiastical cases, by the rules of an ill-defined canon law. The first change was introduced by Matthew Basaraba, prince of Walachia (1633–54), and by Basil the Wolf, prince of Moldavia (1634–53). Basil drew up a criminal code, on the principle of "an eye for an eye." Thus, a man guilty of arson was burned alive. No idea of equality before the law as we understand it now existed. The two nobles of the Roman and Basaraba, besides reforming the canon law, issued a similar criminal code, with a number of civil enactments, based on Roman law, and regulating testamentary guardianship, &c. The next great advance began with the reign of the oecumenical patriarch Constantine (1821–2). The perpetual mitres were made irremovable, and new tribunals created, including a petty court in each rural commune. But nothing was yet done to modify the relative positions of noble and serf. The great opportunity came in 1860, when the provision was made in the union of Moldavia and Walachia in 1859, that the main provisions of Rumanian law and drawn from the codes of western powers, especially the Code Napoleon. Besides the communal courts, there are quarter-sessional or circuit courts, where simple cases are decided. An appeal from these lies to the general or ordinary courts, which are subdivided into circuits and in which sessions are held, at stated times, for the trial by jury of serious offences. Any appeal from the departmental courts is brought before the appeal courts of Bucharest, Craiova, Galatz or Jassy, as the case may be. The appeal courts are divided into sections, or courts of cassation (Curtea de Casatie), which sits in Bucharest.

Defence.—At the accession of Prince Charles, the Rumanian army consisted of raw levies, led by adventurers from any country, provided with no uniform arms, and armed only with pikes or sabres. Under Prince Charles universal and compulsory service was introduced. The present system, in which his reforms culminated, rests upon a law of 1891, modified in 1900 and 1908. But the Rumanian army is divided into two categories. The first is composed of men between the ages of 21 and 30, enrolled in the field army and its reserves. Every citizen capable of bearing arms must serve from his 30th to his 50th year in the second section, or reserve army. The regular army is divided into four cavalry, two infantry and three artillery corps, and is divided into seven armies. Each army consists of between the ages of 36 and 46 belongs to the third section, called the Gocla (Landsturm), which can only be called upon for home service in war. In time of peace the field army consists of four complete army corps, with headquarters at Craiova, Bucharest, Jassy and Galatz; besides an independent brigade in the Dobrudja, and a separate cavalry division with headquarters at Bucharest. The strength in each corps is made up of 3,258 regular officers and 8,956 other commissioned officers and men, and 18,920 horses. The infantry was armed with the Mannlicher magazine rifle (model 1893), the cavalry with the Mannlicher carbine, the horse and field artillery with the Armstrong armament. A general inspection of all the army would contain 225,000 combatants. It was estimated that the militia should ultimately furnish an additional force of 100,000 men, but up to 1910 this branch of the service was not completely organized. The armed forces are divided into two sections, very complete, and the field army is maintained in a high state of efficiency. The war budget for 1909–10 was £2,721,300.

The fortifications designed in 1882 by the Belgian engineer, Cassatie, consist of a series of forts extending in a circuit of 300 miles, 250,000 men, forming the keystone of the national defences. They consist of the Sereth Line, an entrenchment extending over a front of 45 m. from Galatz to Focshani, and intended to cover an army of defence against a Prussian or Austrian army, while a fortification of 22,000 men, who would attack Bucharest the largest fortified camp in the world, except Paris. All these fortifications, including the additional works at Galatz and Focshani, are strongly armed with Krupp and Gruson guns.

The Rumanian navy is divided into two squadrons; one for the Danube, with headquarters at Galatz; one for the Black Sea, with headquarters at Constanza. In 1909–10 the fleet comprised one cruiser, seven gunboats, eight torpedo-boats, six coastguard steamers, three training-ships, several minesweepers, six small vessels, and numerous vessels for naval police. The state possesses a floating dock and a marine arsenal at Galatz.

Religion.—The State Church of Rumania, which is governed by a Patriarch, is predominant in the population. The independence of the Church was formally recognized by the oecumenical patriarch at Constantinople, in 1885. The Rumanian Church had claimed its independence from very ancient times, but under the Turkish suzerainty and later the Austrian dominion, it was subjected to the Greek patriarch at Constantinople. In 1854, it declared itself independent of all foreign prelates. In 1872 a law was passed by which the bishops were authorized to nominate and ordain their own clergy, and to accept or reject the nomination of the government. But in the same year, a law was passed, making the patriarchate of Constantinople subject to the government. The church is divided into separate provinces, and a metropolitan for each province. The present metropolitan, Bishop Constantin Caragiale, is the spiritual head of the Rumanian Church, presiding over the Holy Synod, and the other members being the metropolitan of Jassy (primate of Moldavia), the six bishops of Râmnicu Vâlcea, Roman, Hushu, Buzju, and the deacons from the clerical colleges of Galatz and Bucharest, the eight bishops in patriarca, their coadjutors. Metropolitan and bishops are elected by the senate and deputies, sitting together. In Hungary there are a uniate metropolitan and three bishops belonging to the Rumanian church, and a number of deaneries. The Catholic Church is divided into two distinct branches, the Roman Catholics, or Catholics, and the Greek Catholics, or Old Catholic Church. The Rumanian Catholics, who number 3,000,000, are numerically the largest, and are divided into 11 dioceses. The Roman Catholics are divided into 9
dioceses. Education.—Primary education is free and compulsory, "where schools are available," for children between seven and eleven years of age. At the close of the 19th century, however, the accommodation in the elementary schools was so inadequate as to allow the percentage of illiterates high; reaching 88.5% in some of the rural communities. Great improvements were effected between 1900 and 1907, the number of schools increasing from 3,643 to 4,463, and the number of pupils from 2,008,000 to 2,808,000. The state contributes to the maintenance of elementary schools, for the Vlachs in Macedonia, Bulgaria and Transylvania.
Secondary and higher education are also free. There are gymna-
sia, or grammar schools of four classes, roughly corresponding
with the German sub-gymnasia; and lyceums of eight classes, which
answer to the German gymnasia. Up to the fourth class all pupils
are taught alike in the lyceums; in the fifth, however, they are
divided into a literary or "humanist" section, and a scientific or
"realist" section. The four upper classes are taught French and
German; English and Italian being added for the "realists," Greek
and Latin for the "humanists." Teachers are given to the
agricultural schools; in various arts and crafts institutions, such
as those of Bucharest and Jassy; in the veterinary and engineering
colleges of Bucharest; in numerous commercial schools, and in
schools for the domestic economy for girls. In 1909-10 there were
four ecological schools. Seven training schools for teachers and
eight military schools. The cost of education is largely borne by
the communes, as well as by the state. At Bucharest and Jassy
there are universities with faculties of law, philosophy, science
and medicine and the like.

Antiquities.—The history of primitive civilization in Rumania can
be traced back to the Neolithic Age; numerous remains of this period
have been found at Vodcesta in the Romanatci department. Roman
rule left a deep imprint on the country. The following Roman towns
have been identified: (1) in the Dobrudja, Cius (Hisovra),
Troesmis (Iglita), Arrubium (Machin), Vidunium (Isiaklia),
Istrus (Karahanar), Tropaeum (Adam Klissi), Kallattia (Mangalia),
Tomis (Constantza), and some others; (2) in Moldavia, Dobrogea,
Dinogita (Tighina); (3) in Walachia, Drobeta (Turnu Severei),
Molva (Cravoa), Constanta; (4) in Bukovina, Cucului,
(Craiova), Romanula (Resca), Sorium (Roshori de Vede), Pelendava
(Bradsec); (5) in Transylvania, Enisala; and (6) in Transilvania,
the doctrine of the emperor Commodus (A.D. 161-92) at Ceul. All
these lie within a radius of 60 mi. Two ramparts, known as Trajan's
wall, can be discerned, one on either side of the railway from
Constantza to Constantinople, and the other bridges over the Danube
at Turnu Severin and Turnu Magurele. The Tropaeum Traiani,
of Adam Klissi monument (found near Rassova in the Dobrudja
and removed to Bucharest museum), is a round stone structure of 100 ft.
circumference at 4 ft. and 40 ft. high, carved in low relief with scenes
representing Trajan's conquest of Dacia. (See G. Todescu, Das Monu-
ment von Adam Klissi, Vienna, 1895.)

Few monuments were left by the barbarian invaders who ravaged Rumania from the 3rd
century to the 14th save some vestiges of Gothic culture at Butel, and
Dacian-Bulgarian art at Neamț. The "petroasa" (commonly written Petrosa), preserved in Bucharest museum,
consists of embossed and jewelled gold plate, and probably dates
from the 6th century (see Plate). Medieval tapestries, with ecclesiastical and figurative scenes decorated with
woodwork, are also preserved in Bucharest museum. The attempt
to create a national style of architecture, based on Greek and
Byzantine models, began under Stephen the Great of Moldavia
(1457-1504), existing until the 17th century, when it was, arrested,
first by political disorders, and, later, by the commercial develop-
ment which caused a demand for cheap and rapid building. Its
chief accomplishment is the cathedral of Curtea de Argeș (q.v.).

Painting and sculpture, like modern Rumanian architecture, are
still in their infancy.

BIBLIOGRAPHY.—A list of the numerous statistical and other
official publications issued at Bucharest in Rumanian or French is
given yearly in Annual statistique al României. The final results of
the census of 1890 were published in Bucharest in 1905, with
introduction by Dr. L. Colecu. See also G. J. Lahovari,
Marele dicționar geografic al României (vols. 1-5, Bucharest, 1899-
1902); A. de Gubernatis, La Roumanie et les Roumains (Florence,
1890); J. Deubner, La Roumanie, M. F. Bouchier, La Roumanie
graphique; J. Samuelson, Roumania, Past and Present (London,
1882); G. Beuger, Roumanie en 1900 (trans. from the German by
A. H. Keane (London, 1901)); A. Bellesart, La Roumanie con-
temporaine (Paris, 1905); Luc. I. M. L. Targovia, Istoria Ardealului,
realizat sub la regne de Sa Majesté le Roi Carol I. (Bucharest, 1907);

(Leipzig, 1907); C. Bacaloiu, Histoire de la politique douanière de la
Roumanie de 1870-1903 (2 vols., Bucharest, 1904).

HISTORY

(1) Introduction.—The earliest record of the lands which
congrize the kingdom of Rumania begins with the period
immediately preceding their conquest by the Romans.

Dacia. From the 6th to the 12th century, wave after wave
of barbarian conquerors, Goths, Tatars, Slavs and others,
passed over the country, and, according to one school of
historians, almost obliterated its original Daco-Roman popula-
tion; the modern Vlachs, on this theory, representing a later
body of immigrants from Transdanubian territory. According
to others, the ancient inhabitants were, at worst, only sub-
merged for a time, and their direct descendants are the Romans
of to-day. Each of these conflicting views is supported
by strong evidence; and the whole controversy, too large
and too obscure for discussion here, is considered under the
heading Vlachs.

Towards the close of the 13th century, Walachia and Moldavia
were occupied by a mixed population, composed partly
of Vlachs, but mainly of Slavs and Tatars; in Great Walachia,1
also known as Muntenia, the Petchenges and Cumanians
predominated. Rumanian historians have striven, by
piecing together the stray fragments of evidence which
survive, to prove that their Vlach ancestors had not,
as sometimes alleged, been reduced to a scattered
community of nomadic shepherds, dwelling among the Carpathians
as the serfs of their more powerful neighbours. The researches
of Hasileu, Xenopol and other historians tend to show the existence
of a highly organized Vlach society in Transylvania,
roving with a certain distinctness: Hungary and Moldavia;
Of a settled community, agriculture and the pastoral; and
of a hereditary feudal nobility, bound to pay tribute and render
military service to the Hungarian crown, but enjoying
many privileges, which were defined by a distinct customary law (jus
walachicum).

Although the characteristic titles of voivode, knes and
bon (all implying military as well as civil authority) are
of Slavonic origin, and perhaps derived from the practice of
the later Bulgarian (or Bulgaro-Vlachian) empire, the growth
of Vlach feudal institutions is attributed to German influences,
which permeated through Hungarian channels into the Vlach
world, and transformed the primitive tribal chiefs into a feudal
aristocracy of boars or boyards 2 (nobles).

With the 13th century, at latest, begins the authentic political
history of the Vlachs in Rumania, but it is not the history of
a united people. The two principalities of Walachia
and Moldavia developed separately, and each has its
separate annals. About the year 1774 it first becomes
possible to trace the progress of these
Danubian Principalities in a single narrative, owing to
the uniform system of administration adopted by the
Turks, and the rapid contemporary growth of a national consciousness among the Vlachs. At last, in 1859,
the two principalities were finally united under the name
of Rumania. The subjoined history of the country
is arranged under the four headings: Walachia, Moldavia, the
Danubian Principalities in the Bunionary
Foundation of the Principality.

(2) Walachia.—Tradition, as embodied in a native chronicle
of the 16th century, entitled the History of the Roman Land since
the arrival of the Romans (Istoria ții de Români de la
cândă au descăzut România), gives a precise account
of the founding of the Walachian state by Radu Negru,
or Rudolf the Black (otherwise known as Negru Voda,
the Black Prince), voivode of the Romans of Fugaras in
Transylvania, who in 1290 descended with a numerous people
into the Transalpine plain and established his capital first
at Câmpulung and then at Curtea de Argeș. Radu dies in
1310, and is succeeded by a series of voivodes whose names and
dates are duly given; but this early chapter of Walachian
history has been rudely handled by critical historians. A
considerable body of Vlachs doubtless emigrated from Hungary
at this time, and founded in Walachia a principality dependent
1 i.e. Walachia east of the Olt, not to be confused with the Mehedinti
Blașia in southern Macedonia (see Balkan Peninsula).
2 In later Rumanian history there arose a class who obtained their
rank by merit or favour, and did not necessarily bequeath it to their
heirs. But the hereditary aristocracy also survived, and feudalism
remained characteristic of Rumanian society up to 1860.
on the Hungarian crown; but material is lacking for a detailed description of the movement.

In 1330 the voivode John Bassaraba 1 or Bazarra the Great (1310-38) succeeded in inflicting a crushing defeat on his suzerain King Charles I. of Hungary, and for fourteen years Walachia enjoyed complete independence. Louis the Great (1342-82) succeeded for a while in restoring the Hungarian supremacy, but in 1367 the voivode Vlad or Vladislav inflicted another severe defeat on the Hungarians, and succeeded for a time in outling the Magyar governor of Turnu Severin, and thus incorporating Ol that in his own dominions. Subsequently, in order to retain a hold on the loyalty of the Walachian voivode, the king of Hungary invested him with the title of duke of Fogaras and Omlas, Ruman districts in Transylvania.

Under the voivode Mircea (1386-1418), whose prowess is still celebrated in the national folk-songs, Walachia played for a while a more ambitious part. This prince during the latter part of his reign, as well as the imperial Turkish influence in close alliance with King Ladislaus V. of Poland. He added to his other titles that of "count of Severin, despot of the Dobrudja, and lord of Silistria," and both Vidin and Sistora appear in his possession. A Walachian contingent, apparently Mircea's, aided the Servian tsar Lazar in his vain endeavour to resist the Turks at Kossovo (1389); later he allied himself with his former enemy Sigismund of Hungary against the Turkish sultan Bayezid I., who inflicted a crushing defeat on the allied armies at Nikopolis in 1396. Bayezid subsequently invaded and laid waste a large part of Walachia, but the voivode succeeded in inflicting considerable loss on the retiring Turks, and the capture of Bayezid by Timur in 1402 gave the country a respite. In the internecine struggle that followed among the sons of Bayezid, Mircea espoused the cause of Musa; but, though he thus obtained for a while considerable influence in the Turkish councils, this policy eventually drew on him the vengeance of the sultan Mahomet I., who succeeded in reducing him to a tributary position.

During the succeeding period the Walachian princes appear alternately as the allies of Hungary or the creatures of the Turk. In the later battle of Kossovo of 1448, between the Hungarians, led by Hunyadi János and the sultan Murad II., the Walachian contingent treacherously surrendered to the Turks; but this did not hinder the victorious sultan from massacring the prisoners and adding to the tribute a yearly contribution of 3,000 javelins and 4,000 shields. In 1453 Constantinople fell; in 1454 Hunyadi died; and a year later the sultan invaded Walachia to set up Vlad IV. (1455-62), the son of a former voivode. The father of this Vlad had himself been notorious for his ferocity, but his son, during his Turkish sojourn, had improved on his father's example. He was known in Walachia as Dracul, or the Devil, and his legend name in history as the Impaler. Tales and stories of his ferocious savagery exceed belief. He is said to have feasted amongst his impaled victims. When the sultan Mahomet, infuriated at the impalement of his envoy, the pasha of Vidin, who had been charged with Vlad's deposition, invaded Walachia in person with an immense host, he is said to have found at one spot a forest of pales on which were the bodies of men, women and children. The voivode Radu (1465-75) was substituted for this monster by Turkish influence, and constrained to pay a tribute of 12,000 ducats; but Vlad returned to the throne in 1470-77.

The shilling policy of the Walachian princes at this time is well described in a letter of the Hungarian king Matthias Corvinus (1443-90) to Casimir of Poland. "The voivodes," he writes, "of Walachia and Moldavia swear alternately upon the Turks, the Tartars, the Poles and the Hungarians, that among so many masters their peril may remain unremunerated." The

1 A. Sturdza gives a genealogical table, showing that Radu belonged to the great native dynasty of Bassarab (q.v.) or Bassara, which continued, though not in unbroken succession, to rule in Walachia until 1658, and in Moldavia until 1669.

prevalent laxity of marriage, the frequency of divorce, and the fact that illegitimate children could succeed as well as those born in lawful wedlock, by multiplying the candidates for the voivodeship and preventing any regular system of succession, contributed much to the internal confusion of the country. The elections, though often controlled by the Turkish Divan, were still constitutionally in the hands of the boars, who were split up into various factions, each with its own pretender to the throne. The princes followed one another in rapid succession, and usually met with violent ends. A large part of the population led a pastoral life, and at the time of Veranista's visit to Walachia in the early part of the 16th century, the towns and villages were built of wood and wattle and daub. Tirgovistea alone, at this time the capital of the country, was a considerable town, with two stone castles.

A temporary improvement took place under Neagoe Bassaraba (1512-21). Neagoe was a great builder of monasteries; he founded the cathedrals of Curtea de Argeș (q.v.) and Targoviste, and adorned Mount Athos with his pious works. He transferred the direct allegiance of the Walachian Church from the patriarchate of Ochrida in Macedonia to that of Constantinople. On his death, however, the brief period of comparative prosperity which his architectural works attest was tragically interrupted, and it seemed for a time that Walachia was to sink into a Turkish pashalic. The Turkish commander, Mahmud Bey, became treacherously possessed of Neagoe's young son and successor, and, sending him a prisoner to Stambl, proceeded to nominate Turkish governors in the towns and villages of Walachia. The Walachians resisted desperately, elected Radu, a kinsman of Neagoe, voivode, and succeeded with Hungarian help in defeating Mahmud Bey at Graumaz in 1522. The conflict was prolonged with varying fortunes until in 1524 the dogged opposition of the Walachians triumphed in the sultan's recognition of Radu. But the battle of the Poles, 1526 decided the long preponderance of Turkish control. The unfortunate province served as a transit route for Turkish expeditions against Hungary and Transylvania, and was exhausted by continual requisitions. Turkish settlers were gradually making good their footing on Walachian soil, and mosques were rising in the towns and villages. The voivode Alexander, who succeeded in 1591, and like his predecessors had bought his post of the Divan, carried the oppression still further by introducing a janissary guard and applying to his capital out his possessions to his Turkish supporters. Meanwhile the Turkish governors on the Bulgarian bank never ceased to ravage the country, and again it seemed as if Walachia must share the fate of the Balkan States and succumb to the direct government of the Ottoman.

In the depth of the national distress the choice of the people fell on Michael, the son of Petrușko, ban of Craiova, the first dignitary of the realm, who had fled to Transylvania to escape Alexander Maniu's Ataturks. Supported at Constantinople by two influential personages, Sigismund Báthory, prince of Transylvania (1587-98 and 1601-2), and the English ambassador, Edward Barton, and aided by a loan of 200,000 florins, Michael succeeded in procuring from the Divan the deposition of his enemy and his own nomination.

The genius of Michael "the Brave" (1593-1601) secured Walachia for a time a place in universal history. The moment for action was favourable. The emperor Rudolph II. had gained some successes over the Turks, and Sigismund Báthory had been driven by Turkish extortions to throw off the allegiance to the sultan. But the first obstacle was to deal with the presence of the enemy within the walls. By previous concert with the Moldavian voivode Aaron, on the 13th of November 1594, the Turkish guards and settlers in the two principalities were massacred at a given signal. Michael followed up these Walachian Vesprys by an actual invasion of Turkish territory, and, aided by Sigismund Báthory, succeeded in carrying by assault Rustchuk, Silistria, and other places on the right bank of the lower Danube. A simultaneous invasion of Walachia by a large Turkish and Tatar host was successfully defeated;
The Tatar khan withdrew with the loss of his bravest followers, and, in the great victory of Mantin on the Danube (1595), the Turkish army was annihilated, and its leader, Mustafa, slain. The sultan sent Sinan Pasha, "the Renegade," to invade Walachia with 100,000 men. Michael withdrew to the mountains before this overwhelming force, but, being joined by Bâthory with a Transylvanian contingent, the voivode resumed the offensive, stormed Bucharest, where Sinan had entrenched a Turkish detachment, and, pursuing the main body of his forces to the Danube, overtook the rearguard and cut it to pieces, capturing enormous booty. Sinan Pasha returned to Constantinople to die; it is said, of vexation; and in 1597, the sultan, weary of a disastrous contest, sent Michael a red flag in token of reconciliation, reinvested him for life in an office of which he had been unable to deprive him, and granted the succession to his son.

In 1599, on the abdication of Sigismund Báthory in Transylvania, Michael, in league with the imperialist forces, and in convivance with the Saxon burghers, attacked and defeated his successor Andreas Báthory near Hermannstadt, seizing himself the reins of government, secured his proclamation as prince of Transylvania. The emperor consented to appoint him viceroy (locum tenens per Transylvania), and the sultan ratified his election. As prince of Transylvania he summoned diets in 1599 and 1600, and, having expelled the voivode of Moldavia, united under his sceptre three principalities. The partiality that he showed for the Ruman and Szekler parts of the population alienated, however, the Transylvanian Saxons, who preferred the direct government of the emperor. The imperial commissioner General Basta lent his support to the disaffected party, and Michael was driven out of Transylvania by a successful revolt, while a Polish army invaded Walachia from the Moldavian side. Michael’s coolness and resource, however, never deserted him. He resolved to appeal to the emperor, rode to Prague, won over Rudolph by his singular address, and, richly supplied with funds, reappeared in Transylvania as imperial governor. In conjunction with Basta he defeated the superior Transylvanian army at Gorosi, expelling Sigismund Báthory, who had again aspired to the crown, and taking one hundred and fifty flags and forty-five cannon. But at the moment of his returning prosperity Basta, who had quarrelled with him about the supreme command of the imperial forces, procured his murder on the 10th of August 1601. Not only had Michael succeeded in rolling back for a time the tide of Turkish conquest, but for the first and last time in modern history he united what once had been Trajan’s Dacia, in its widest extent, and with it the whole Ruman race north of the Danube, under a single sceptre.

Michael’s wife Florica and his son Nicholas were carried off into Tatar captivity, and Şerban or Sherban, of the Bassarab family, was raised to the voivodeship of Walachia by imperial influences, while Sigismund resumed the government of Transylvania. On his deposition by the Porte in 1610, there followed a succession of princes who, though still for the most part of Ruman origin, bought their appointment at Stambul. While Walachian contempt were continually employed by the Turks in their Polish wars, and the settling of Greeks in an official or mercantile capacity in the principality provoked grave discontent, which on one occasion took the form of a massacre.

The reign of the voivode Matthias Bassaraba (1634–54) was an interval of comparative prosperity. Matthias repulsed his powerful rival, Basil the Wolf, the voivode of Moldavia and his Tatar and Cossack allies. His last days were embittered, however, by an outbreak of military anarchy. His illegitimate son and successor, Constantin Şerban (1654–58), was the last of the Bassarab dynasty to rule over Walachia; and on his death the Turkish yoke again weighed heavier on his country. The old capital, Targoviste, was considered by the Divan to be too near the Transylvanian frontier, and the voivodes were accordingly compelled to transfer their residence to Bucharest, which was finally made the seat of government in 1658.
RUMANIA

An

predecessor, and the recently erected palace, which had a marble staircase and a fine garden, the houses were of wood. The dress of the men was thoroughly Turkish except for their lamb-skin caps, that of the women half Greek, half Turkish. The houses were scrupulously clean and strewn with sweet herbs. Del Chiaro notices the great imitative capacity of the race, both artistic and mechanical. A Walachian in Venice had copied several of the pictures there with great skill; the copper-plates and wood engravings for the new press were executed by native hands. The Walachians imitated every kind of Turkish and European manufacture; and, though the boars imported finer glass from Venice and Bohemia, a glass manufacture had been established near Tirgoviste which produced a better quality than the Polish. From the Bucharest press, besides a variety of ecclesiastical books, there were issued in the Ruman tongue a translation of a French work entitled *The Maxims of the Oriental Turks.* The 17th century

Brancovan had a map of the country made and a copper-plate engraving of it executed at Padua.

The prosperity of Walachia, however, under its “Golden Bey,” as Brancovan was known at Stamboul, only increased the Turkish exactions; and, although all demands were punctually met, the sultan finally resolved on the removal of his too prosperous vassal. Brancovan was accused of secret correspondence with the tsar, the king of Poland and the Venetian republic, of betraying the Porte’s secrets, of preferring Tirgovistea to Bucharest as a residence, of acquiring lands and palaces in Transylvania, of keeping agents at Venice and Vienna, in both of which cities he had invested large sums, and of striking gold coins with his effigy. An envoy arrived at Bucharest on the 4th of April 1716, and proclaimed Brancovan *まし* (i.e. deposed). He was conducted to Constantinople and beheaded, together with his four sons. A scion of the rival Cantacuzenian family was elected by the pasha’s orders, and he, after exhausting the principality for the benefit of the Divan, was in turn deposed and executed in 1716.

From this period onwards the Porte introduced a new system with regard to its Walachian vassals. The line of national princes ceased. The office of voivode or hospodar was sold to the highest bidder at Stamboul, to be farmed out from a purely mercenary point of view. The princes who now succeeded one another in rapid succession were mostly Greeks from the Phanar quarter of Constantinople who had served the palace in the quality of dragoman (interpreter), or held some other court appointment. They were nominated by imperial firman without a shadow of free election, and were deposed and transferred from one principality to another, executed or reappointed, like so many pashas. Like pashas they rarely held their office more than three years, it being the natural policy of the Porte to multiply such lucrative nominations. The same hospodar who had in 1716 executed the Walachian containing a raven holding a cross in its beak between a moon and a star, is engraved by Del Chiaro. They were of 2, 3 and 10 ducats weight.

1 One of these, with the legend “**Constantinus Bassaraba de Brancovan D.G.Voevoda et Princeps Walachiae Transalpinae,** and hereupon the reverse engraving of Walachia containing a raven holding a cross in its beak between a moon and a star, is engraved by Del Chiaro. They were of 2, 3 and 10 ducats weight.

emitted, and the population rapidly diminished. In 1745 the number of tax-paying families, which a few years before had amounted to 147,000, had sunk to 70,000. Yet the taxes were continually on the increase, and the hospodar Scarlet Ghica (1758–61), though he tried to win some popularity by the removal of Turkish settlers and the abolition of the *sahart* or tax on cattle and horses, which was peculiarly hateful to the peasantry, raised the total amount of taxation to 25,000,000 lion-dollars, about £1,000,000. The Turks meantime maintained their grip on the country by holding on the Walachian bank of the Danube the fortresses of Giurgevo, Turnu Severin and Orsova, with the surrounding districts.

But the tide of Ottoman domination was ebbing fast. Already, by the peace of Passarowicz Pozharevats in 1778, the banat of Craiova had been ceded to the emperor, though by the peace of Belgrade in 1739 it was recovered by the Porte for its Walachian vassal. In 1769 the Russian general Romanzov occupied the principality, the bishops and clergy took an oath of fidelity to the empress Catherine, and a deputation of boars followed. The liberties of the country were guaranteed, taxation reformed and in 1772 the negotiations at Fokhshani between Russia and the Porte broke down because the empress’s representatives insisted on the sultan’s recognition of the independence of Walachia and Moldavia under a European guarantee. Turkish rule was, however, definitely restored by the treaty of Kuchuk Kainardji, in 1774; and as from this period onwards Walachian history is closely connected with that of Moldavia, it may be convenient before continuing this review to turn to the earlier history of the sister principality.

(3) Moldavia.—According to the native traditional account, as first given by the Moldavian chroniclers of the 16th, 17th and 18th centuries, Dragosh the son of Bogdan, the founder of the Moldavian principality, emigrated with his followers from the Hungarian district of Marmaros in the northern Carpathians. The dates assigned to this event vary from 1299, given by Urechia, to 1342, given by the monastic chronicle of Putna. The story is related with various fabulous accompaniments. From the aurochs (*simbra*), in pursuit of which Dragosh first arrived on the banks of the Moldova, is derived the ox-head of the Moldavian national arms, and from his favourite hound who perished in the waters the name of the river. From the Hungarian and Russian sources, which are somewhat more precise, the date of the arrival of Dragosh, who is confused with the historical Bogdan Voda (1349–1365), appears to have been 1349, and his departure from Marmaros was carried out in defiance of his Hungarian suzerain.

These legendary accounts seem to show that the Moldavian vovodat was founded, like that of Walachia, by Vlach immigrants from Hungary, during the first half of the 14th century. Its original strength lay probably in the compact Ruman settlements among the eastern Carpathians, first mentioned by Nicetas of Chonae, about 1164. The Moldavian lowlands were still held by a variety of Tatar tribes, who were only expelled after 1355, by the united efforts of Andrew Laszkovich, voivode of Transylvania, and Bogdan Voda, the first independent prince of Moldavia. Coins bearing the name of Bogdan are still extant; and there is an inscription over his tomb at the monastery of Radautzai, in Bukovina, published by Huber. The Great of Moldavia (1472–1504).

In the agreement arrived at between Louis of Hungary and the emperor Charles IV. in 1372, the vovodat of Moldavia was recognized as a dependency of the crown of St Stephen. The overlordship over the country was, however, contested by the king of Poland, and their rival claims were a continual source of dispute between the two kingdoms. In 1412 a remarkable agreement was arrived at between Sigismund, in his quality of king of Hungary, and King Ladislaus II. of Poland, by which both parties...
RUMANIA

In 1504 Stephen the Great died, and was succeeded by his son, Bogdan III. "the One-eyed." At feud with Poland about Pokutia, despairs of efficacious support from hard-pressed Hungary, the new voivoide saw no hope of safety except in a dependent alliance with the advancing Ottoman power, which already hemmed Moldavia in on the Walachian and Crimean sides. In 1513 he agreed to pay an annual tribute to the sultan Selim in return for the sultan's guarantee to preserve the national constitution and religion of Moldavia, to which country the Turks now gave the name of Kara Bogdan, from their first vassal. The terms of Moldavian submission were further regulated by a firman signed by the sultan Suleiman at Budapest in 1529 by which the yearly present or backskish, as the tribute was euphoniously called, was fixed at 4000 ducats, 40 horses and 25 falcons, and the voivoide was bound at need to supply the Turkish army with a contingent of 1000 men. The Turks pursued much the same policy as in Walachia. The tribute was gradually increased. A bold was obtained on the country by the occupation of various fortresses on Moldavian soil with the surrounding territory— in 1538 Cetatea Alba, in 1592 Bender, in 1702 Chotim (Khotin). Already by the middle of the 16th century the yoke was so heavy that the voivoide Elias (1546–51) became Mahomedan to avoid the sultan's anger.

At this period occurs a curious interlude in Moldavian history. In 1561 the adventurer and impostor Jacob Basilicus succeeded with Hungarian help in turning out the voivoide Alexander Lapusheanu (1552–61 and 1563–68) and seizing the reins of government. A Greek by birth, adopted son of Jacob Heraklides, despot of Paros, Samos and other Aegean islands, acquainted with Greek and Latin literature, and master of most European languages; appearing alternately as a student of astronomy at Wittenberg, whither he had been invited by Count Mansfeld, as a correspondent of Melanchthon, and as a writer of historical works which he dedicated to Philip II. of Spain, Basilicus, finding that his Aegean sovereignty was of little practical value beyond the crowning of poet laureates, fixed his roving ambition on a more substantial dominion. He published an astonishing pedigree, in which, starting from "Hercules Triptolemus," he wound his way through the royal Servian line to the kinship of Moldavian voivodes, and, having won the emperor Ferdinand to his financial and military support, succeeded, though at the head of only 1600 cavalry, in routing by a bold dash the vastly superior forces of the voivoide, and even in purchasing the Turkish confirmation of his usurped title. He assumed the style of [bàsileúos Moldàvias], and eluded the Turkish stipulation that he should dismiss his foreign guards. In Moldavia he appeared as a moral reformer, endeavouring to put down the prevalent vices of bigamy and divorce. He erected a school, placed it under a German master, and collected children from every part of the country to be maintained and educated at his expense. He also busied himself with the collection of a library. But his taxes—a ducat for each family were considered heavy; his orthodoxy was suspected, his foreign counsellors detested. In 1563 the people rose, massacred the Hungarian guards, the foreign settlers, and finally Jacob himself.

The expelled voivoide Alexander was now restored by the Porte, the schools were destroyed, and the country relapsed into its normal state of barbarism under Bogdan IV. (1568–72). Bogdan's successor, John the Terrible (1572–74), was provoked by the Porte's demand for 120,000 ducats as tribute instead of 60,000 as heretofore to rise against the oppressor; but after gaining three victories he was finally defeated and slain (1574), and the country was left more than ever at the mercy of the Ottoman. Voivodes were now created and deposed in rapid succession by the Divan, but the victories of Michael the Brave in Walachia infused a more independent spirit into the Moldavians. The Moldavian dominion was now disputed by the Transylvanians and Poles, but in 1600 Michael succeeded in annexing it to his "Great Dacian" realm. On Michael's murder the Poles under Zamoyski again
asserted their supremacy, but in 1618 the Porte once more recovered its dominion and set up successively two autocracies of its own as voivodes—Gratiani, an Italian who had been court jeweller, and a Greek custom-house official, Alexander.

As in Walachia at a somewhat later date, the Phanariote régime seemed now thoroughly established in Moldavia, and it became the rule that every three years the voivode should procure his confirmation by a large baskheesh, and every year by a smaller one. But Prince Basil the Wolf (Vasile Lupul), an Albanian, who succeeded in 1633, showed great ability, and for twenty years maintained his position on the Moldavian throne. He introduced several internal reforms, codified the written and unwritten laws of the country, established a printing press, Greek monastic schools, and also a Latin school. He brought the Moldavian Church into more direct relation with the patriarch of Constantinople, but also showed considerable favour to the Latins, allowing them to erect churches at Suceava, Jassy and Galatz. The last voivode of the Bassaraba family, Elias Voda, reigned from 1667 to 1669.

During the wars between Sobieski, king of Poland (1674–96), and the Turks, Moldavia found itself between hammer and anvil, and suffered terribly from Tatar devastations. The voivode Duka was forced like his Walachian contemporary to supply a contingent for the siege of Vienna in 1683. After Sobieski’s death in 1696, the hopes of Moldavia turned to the advancing Muscovite power. In 1711 the voivode Demetrius Cantemir, rendered desperate by the Turkish exactions, concluded an agreement with the tsar Peter the Great by which Moldavia was to become a protected and vassal state of Russia, with the enjoyment of its traditional liberties, the voivodeship to be hereditary in the family of Cantemir. On the approach of the Russian army the prince issued a proclamation containing the terms of the Russian protectorate and calling on the boiars and people to aid their Orthodox deliverers. But the long Turkish terrorism had done its work, and at the approach of a Turkish and Tatar host the greater part of the Moldovans deserted their voivode. The Russian campaign was unsuccessful, and all that Peter could offer Cantemir and the boiars who had stayed by him was an annual Russian salt payment.

In his Russian exile Cantemir composed in a fair Latin style his Descriptio Moldaviae, the counterpart, so far as Moldavia is concerned, to Del Chiaro’s contemporary description of Walachia. The capital of the country was now Jassy, to which city Stephen the Great had transferred his court from Suceava, the earlier residence of the voivodes. It had at this time forty churches—some of stone, some of wood. Fifty years before it had contained 12,000 houses, but Tatar devastations had reduced it to a third of its former size. The most important commercial emporium was the Danubian port of Galatz, which was frequented by vessels from the whole of the Levant from Trebizond to Barbary. The cargoes which they here took in consisted of Moldavian timber (oak, deal and cornel), grain, butter, honey and wax, salt and nitre. Kilias, at the north mouth of the Danube, was also frequented by trading vessels, including Venetian and Ragusan. Moldavian wine was exported to Poland, Russia, Transylvania, and Hungary; that of Cotnari was in Cantemir’s opinion superior to Tokay. The excellence of the Moldavian horses is attested by a Turkish proverb; and annual droves of as many as 40,000 Moldavian oxen were sent across Poland to Danzig. Moldavia proper was divided into the upper country or T’erra de sus, and the lower country, or T’erra de josu. Bessarabia had been detached from the rest of the principality and placed under the direct control of the military authorities. It was divided into four provinces: that of Budzak, inhabited by the Nogai Tatars; that of Cetatea Alba, the Greek Monkastron, a strongly fortified place; and those of Ismaila and Kilia. The voivodes owed their nomination entirely to the Porte, and the great officers of the realm were appointed at their discretion. These were the Great Logothete (Marelde Logofetu) or chancellor; the governor of Lower Moldavia—Vornicul de l’era de josu; the Haiman or commander-in-chief; the high chamberlain—Marlede Postelnicu; the great Spahar, or sword-bearer; the great cup-bearer—Marlede Paharnicu; and the treasurer, or Vistiernicu, who together formed the prince’s council and were known as Boiari de Sotu. Below these were a number of subordinate officers who acted as their assessors and were known as boiars of the Divan (Boiari de Divanu). The high court of justice was formed by the prince, metropolitan and boiars: the Boiari de Sotu decided on the verdict; the metropolitan declared the law; and the prince pronounced sentence. The boiars were able to try minor cases in their own residences, but subject to the right of appeal to the prince’s tribunal. Of the character of the Moldavian people Cantemir does not give a very favourable account. Their best points were their hospitality and, in Lower Moldavia, their valour. They cared little for letters, and were generally indolent, and their prejudice against mercantile pursuits left the commerce of the country in the hands of Armenians, Jews, Greeks and Turks. The pureblood Moldavian population, noble and simple, continued to inhabit the cities and towns or larger villages; the peasantry were mostly of Little Russian and Hungarian race, and were in a servile condition. There was a considerable gipsy population, almost every boiar having several Zingar families in his possession; these were mostly smiths.

From this period onwards the character of the Ottoman domination in Moldavia is in every respect analogous to that of Walachia. The office of voivode or hospodar was farmed out by the Porte to a succession of wealthy Greeks from the Phanar quarter of Constantinople. All formality of election by the boiars was now dispensed with, and the princes received their cation or office at Constantinople, where they were consecrated by the Greek patriarch. The system favoured Turkish extortion in two ways: the presence of the voivode’s family connexions at Stamboul gave the Porte so many hostages for its obedience; on the other hand the princes themselves could not rely on any support due to family influence in Moldavia itself. They were thus more tempted to rely on the Porte itself, and were dependent and shifted with the same facility as so many pashas—an object of Turkish policy, as each change was a pretext for a new levy of bakshesh. The chief families that shared the office during this period were those of Mavrocordato, Ghica, Callimachi, Ypsilanti and Murusi. Although from the very conditions of their creation they regarded the country as a field for exploitations, they were themselves often men of education and ability, and unquestionably made some praiseworthy attempts to promote the general culture and well-being of their subjects. In this respect, even the Phanariote régime was preferable to mere pasha rule, while it had the further consequence of preserving intact the national form of administration and the historic offices of Moldavia. Gregory Ghica (1744–77), who himself spoke French and Italian, founded a school or “gymnasium” at Jassy, where Greek, Latin and theology were taught in a fashion. He encouraged the settlement of German Protestant colonists in the country, some of whom set up as shoemakers in Jassy, where they were further allowed to build an evangelical church. J. L. Carra, a Swiss who had been tutor to Prince Ghica’s children, and who published in 1781 an account of the actual state of the principalities, speaks of some of the boiars as possessing a taste for French literature and even for the works of Voltaire, a tendency actively cultivated by the patriarch of Constantinople.

The Russo-Turkish War, which ended in the peace of Kutchuk Kainardji (1774), was fatal to the integrity of Moldavian territory. The house of Austria, which had already annexed Galicia in 1772, profited by the situation to arrange with both contending parties for the peaceable cession of Bukovina to the Habsburg monarchy. This richly wooded Moldavian province, containing Suceava...
In 1804 the Serbs under Karageorge rose against the Turkish dominion, and were secretly aided by the Walachian voivode Ypsilanti. The Porte, instigated by Napoleon's ambassador Sebastiani, resolved on Ypsilanti's deposition, but the hosopard succeeded in escaping to St. Petersburg. In the war that now ensued between the Russians and the Turks, the Russians were for a time successful, and even demanded that the Russian territory should extend to the Danube. They occupied the principalities from 1806 to 1812. In 1808 they formed a governing committee consisting of the metropolitan, another bishop, and four or five boiars under the presidency of General Kutuzov. The seat of the president was at Jassy, and General Engelhardt was appointed as vice-president at Bucharest. By the peace of Bucharest, however, in 1812, the principalities were restored to the sultan under the former conditions, with the exception of Bessarabia, which was ceded to the tsar. The Pruth thus became the Russian boundary.

The growing solidarity between the two Ruman principalities received a striking illustration in 1816, when the Walachian and Moldavian hospodars published together a code applicable to both countries, and which had been elaborated by a joint commission. The Greek movement was now beginning to assume a practical shape. About 1780 Riga Veleslini, a Hellenized Vlach from Macedonia who is also known by the purely Greek name of Rigas Pheroeus, had founded in Bucharest a patriotic and revolutionary association known as the Society of Friends (έραυα των διώκων) which gradually attained great influence. In 1810 Imitzov, the metropolitan of Walachia, founded a Greek literary society in Bucharest which soon developed into a political association, and many similar bodies were formed throughout the Greek world, and finally united into one powerful secret society, the Hetairia. Some of the members even cherished the fantastic hope of restoring the ancient Byzantine empire. In 1811 Alexander Magalov, the son of the voivode of a branch of the same family, Alexander I, entered Moldavia at the head of the Hetairia, and, representing that he had the support of the tsar, prevailed on the hospodar Michael Sutzu to aid him in invading the Ottoman dominions. To secure Walachian help, Ypsilanti advanced on Bucharest, but the prince, Theodore Vladimirescu, who represented the national Ruman reaction against the Phanariotes, repulsed his overtures with the remark "that his business was not to march against the Turks, but to clear the country of Phanariotes." Vladimirescu was slain by a Greek revolutionary agent, but Ypsilanti rashly continuing his enterprise after he had been repudiated by the Russian emperor, his forces were finally crushed by the Turks at Dragashani, in Walachia, and at Skulemi, in Moldavia; and the result of his revolt was a Turkish occupation of the principalities. In 1822 the Turkish troops, who had committed great excesses, were withdrawn on the combined representations of Russia, Austria and Great Britain. The country, however, was again ravaged by the retiring troops, quarters of Jassy and Bucharest burned, and the complete evacuation delayed till 1824, when the British government again remonstrated with the Porte (see Eastern Question; Greece; Ypsilanti; Alexander).

By the convention of Akkerman between the Russians and the Turks in 1826 the privileges of the principalities were once more confirmed, and they were again ratified in 1829, under Russian guarantee, by the peace of Adrianople. By this peace all the towns on the left bank of the Danube were restored to the principalities, and the Porte undertook to refrain from fortifying any position on the Walachian side of the river. A Russian army occupied the country until the Porte fulfilled its promises. The principalities were to enjoy commercial freedom, and the right of establishing a quarantine cordon along the Danube or elsewhere. The internal constitution of the countries was to be regulated by an "Organic Law," which was drawn up by assemblies of bishops and boiars at Jassy and Bucharest, acting, however, under Russian control. The Organic Law thus elaborated was by no means a liberal character, and amongst other abuses maintained the feudal privileges of the boiars. It was ratified by the Porte in 1834, and the Russian army of occupation thereupon withdrew. The newly elected hospodars, Alexander Ghica (1834-42) and George Bibescu (1842-48) in Walachia, and Michael Sturdza (1834-49) in Moldavia, ruled in accordance with the Organic Law. Their reigns were marked by the social, financial and political predominance of Russia, which had steadily increased since 1771. The treaty of 1774 had given Russia a firm foothold in Rumanian politics.
had been strengthened by the hattiserh of 1802; while the treaties of 1812, 1826 and 1829 had respectively yielded up Bessarabia, the Sulina mouth of the Danube and the St George mouth to the tsar. From 1834 to 1848 the Russian consul at Bucharest was all-powerful.

The revolutionary movement of 1848 extended from the Roumanians of Hungary and Transylvania to their kinsmen of the Transalpine regions. Here its real object was the overthrow of Russian influence. In Moldavia the agitation was mostly confined to the boiars, and the hospodar Michael Sturdza succeeded in arresting the ringleaders. In Walachia, however, the outbreak took a more violent form. The people assembled at Bucharest, and demanded a constitution. Prince Bibescu, after setting his signature to the constitution submitted to him, fled to Transylvania, and a joint Russo-Turkish dictatorship restored the Organic Law. By the Balta-Liman convention of 1849 the two governments agreed to the appointment of Barbâ Stirbeu (Stirbey) as prince of Walachia, and Gregory Ghica for Moldavia.

On the release of the Russian troops into the principalities in 1853, the hospodars fled to Vienna, leaving the government in the hands of their ministers. During the Danubian campaign that now ensued great suffering was inflicted on the inhabitants, but in 1854 the cabinet of Vienna induced the Russians to withdraw. Austrian troops occupied the principalities, and the hospodars returned to their posts. One important consequence of the revolution had been the banishment of many rising politicians to western Europe, where they were brought into contact with a higher type of civilization. The practice initiated by the more liberal Phanariots of sending Rumanian students to the French, German and Italian universities tended in the same direction. Statesmen such as I. C. Brătianu, D. A. Sturdza, S. I. Ghica, D. Ghica and Lascăr Catargiu (whose biographies are given under separate headings) received their political training abroad, and returned to educate their countrymen. To this fact the surprisingly rapid progress of Rumania, as compared with the Balkan States, may very largely be attributed.

By the treaty of Paris in 1856 the principalities with their existing privileges were placed under the collective guarantee of the contracting Powers, while remaining under the suzerainty of the Porte—the Porte on its part engaging to respect the complete independence of their internal administration. A strip of southern Bessarabia was restored to Moldavia, so as to push back the Russian frontier from the Danube mouth. The existing laws and statutes of both principalities were to be revised by a European Commission, sitting at Bucharest, and their work was to be assisted by a Divan or national council which the Porte was to convocate for the purpose in each of the two provinces, and in which all classes of Walachian and Moldavian society were to be represented. The European commission, in arriving at its conclusions, was to take into consideration the opinion expressed by the representative councils; the Powers were to come to terms with the Porte as to the recommendations of the commission; and the final result was to be embodied in a hattiserh of the sultan, which was to lay down the definitive organization of the two principalities. In 1857 the commission arrived, and the representative councils of the two peoples were convoked. On their meeting in September they at once proceeded to vote with unanimity the union of the two principalities into a single state under the name of Romania (Rumania), to be governed by a foreign prince elected from one of the reigning dynasties of Europe, and having a single representative assembly. The Powers decided to undo the work of national union. By the convention concluded by the European congress at Paris in 1858, it was decided that the principalities should continue as heretofore to be governed each by its own prince. Walachia and Moldavia were to have separate assemblies, but a central commission was to be established at Fokshani for the preparation of laws of common interest, which were afterwards to be submitted to the respective assemblies. In accordance with this convention the deputies of Moldavia and Walachia met in separate assemblies at Bucharest and Jassy, but the choice of both fell unanimously on Prince Alexander John Cuza (January 1859).

(g) Rumania.—Thus the union of the Rumanian nation was accomplished. A new conference met in Paris to discuss the situation, and in 1861 the election of Prince Cuza as king was ratified by the Powers and the Porte. The two assemblies and the central commission were preserved till 1862, when a single assembly met at Bucharest and a single ministry was formed for the two countries. The central commission was at the same time abolished, and a council of state charged with preparing bills substituted for it. In May 1864, owing to difficulties between the government and the general assembly, the assembly was dissolved, and a statute was submitted to universal suffrage giving greater authority to the prince, and creating two chambers (of senators and of deputies). The new constitution enabled all citizens, a cumulative voting power being reserved, however, for property, and the peasants were emancipated from forced labour. Up to this point the prince had ruled wisely; he had founded the universities of Bucharest and Jassy; his reforms had swept away the last vestiges of feudalism and created a class of peasant freeholders. But the closing years of his reign were marked by an attempt to concentrate all power in his own hands. He strove to realize his democratic ideals by despotic methods. His very reforms alienated the goodwill of all classes; of the nobles, by the abolition of forced labour; of the clergy, by the confiscation of monastic estates; of the masses, by the introduction of a tobacco monopoly and the inevitable collapse of the inflated hopes to which his agrarian reforms had given rise. His own absolute conduct increased his unpopularity, and at last the leading statesmen in both provinces, who had long believed that the national welfare demanded the election of a foreign prince, conspired to dethrone him. In February 1866 he was compelled to abdicate; and a council of regency was formed under the presidency of Prince Ion Ghica. The count of Flanders, brother to the king of the Belgians, was proclaimed hospodar of the united provinces, but declined the professed honour.

Meanwhile a conference of the Powers assembled at Paris and decided by a majority of four to three that the new hospodar should be a native of the country. The principalities, however, determined to elect Prince Charles, the second son of Prince Charles Antony of Hohenzollern-Sigmaringen. On a referendum, 685,969 electors voted in his favour, against 224 dissentients. Prince Charles was an officer in the Prussian army, twenty-seven years of age, and was related to the French imperial family as well as to the royal house of Prussia: his nomination obtained not only the tacit consent and approval of his friend and kinsman King William of Prussia, but also the warm and more open support of Napoleon III. The king of Prussia, however, had agreed that the new hospodar should be a native of the principalities, and could not therefore openly approve of Prince Charles’s election. Acting on the advice of Bismarck, the prince asked for a short leave of absence, resigned his commission in the Prussian army on crossing the frontier, and hastened down the Danube to Rumania, under a feigned name and with a false passport. On the 20th of May he landed at Turnu Severin, where he was enthusiastically welcomed. He reached Bucharest on the 22nd, and on the same day, in the presence of the provisional government, took the oaths to respect the laws of the country and to maintain its rights and the integrity of its territory. In October Prince Charles proceeded to Constantinople and was cordially received by his suzerain, the sultan, who bestowed on him the firman of investiture, admitted the principle of hereditary succession in his family, and allowed him the right of maintaining an army of 30,000.
men. Rumania was to remain part of the Ottoman empire within the limits fixed by the capitulations and the treaty of Paris.

The first Rumanian ministry formed under the new prince was composed of the leading statesmen of all political parties, care being taken that the two provinces should be equally represented. A new constitution was unanimously provided for by the chamber on the 11th of July. It was included in a Upper and Lower House of Representatives, and conferred on the prince the right of an absolute and unconditional veto on all legislation. Other reforms were urgently needed. There was an empty treasury, and the floating debt amounted to £7,000,000; maladministration was rampant in every department of the state; the national guard was mutinous, while the small army of regulars was badly organized and inefficient. The existence of famine and cholera added to the difficulties of the government, and, in March 1867 the Lower House, by a majority of three, passed the lasonic resolution, "The chamber inflicts a vote of blame on the government." As the result of this vote M. Kretzulescu, a Moderate Conservative, was called to the head of affairs, and I. C. Bratianu entered the government as minister of the interior. The new ministry, of which Bratianu was the leading spirit, showed considerable energy: a concession was granted for the construction of the first Rumanian railway, from Bucharest to Giurgevo, and the reorganization of the army was undertaken. Among other less judicious measures, a decree was passed ostensibly directed against all vagabonds foreigner, but really aimed at the Jews, large numbers of whom, including many respected landowners and men of business, were imprisoned, or expelled, from Jassy, Bacau and other parts of Moldavia. This harsh treatment created intense indignation abroad, especially in France and Great Britain, and the emperor Napoleon wrote personally to Prince Charles, protesting against the persecution. The country could not afford to lose the goodwill of the emperor of the French, at that time one of the most powerful factors in Europe—in July 1869 Bratianu, although immensely popular, found it necessary to resign office, and with him fell the rest of the cabinet.

On the 15th of September 1869, Prince Charles married Princess Elizabeth of Wied, afterwards celebrated under her literary name of Carmen Sylva.1 In the same year the army was reorganized, and a rural police created. Every able-bodied citizen was rendered liable to give three days' work yearly towards the construction of roads, or to pay a small tax as an equivalent. An important railway concession, which subsequently caused grave political complications, was granted to the German contractors Strausberg and Offenheim.

Much excitement was aroused in Rumania by the outbreak of the war between Prussia and France. The sympathies of the Rumanians were entirely on the side of the French, whom they regarded as a kindred Latin race, while those of the prince were naturally with his native country. The excitement culminated in a revolution at Ploesci, where a Radical deputy, Candianu Popescu, after having stormed the militia barracks, issued a proclamation deposing Prince Charles and appointing General Golescu regent. Owing to the loyalty of the regular army the insurrection was speedily quelled. But the feeling in the country was strong against the German sovereign, who seriously thought of abdicating when a jury acquitted the accused rebels. On the 7th of December he wrote confidentially to the sovereigns whose representatives had signed the treaty of Paris, suggesting that the future of Rumania should be regulated by a European congress.

A few days subsequently the prince learned that the German railway contractor Strausberg was unwilling or unable to pay the coupons of the railway bonds due on the 1st of January 1871, which were mostly held by influential people in Germany. This threw the responsibility of payment on Rumania, and was a severe blow to the prince, through whose instrumentality the loan had been placed. Matters were brought to a crisis by the Russian government threatening to force the Rumanian government to provide for the unpaid coupons. The country was financially in no condition to comply. Bitter indignation prevailed against everything German, and culminated in an attack on the German colony in Bucharest on the 22nd of March 1871. On the following morning the prince summoned the members of the council of regency of 1866, and informed them of his intention to place the government in their hands. Lascar Catargiu and General Golescu, the only two members present, as well as Dimitrie Sturdza and other influential persons, declined to accept the responsibility. Catargiu offered to unite the different sections of the Conservative party in order to deal with the crisis. The prince accepted his offer. The elections took place early in May 1871, and the government, to which all the most respectable elements in the country had rallied, obtained a large majority. When parliament met in May the prince had a most enthusiastic reception. The anti-German feeling in the country had greatly subsided, in consequence of the crushing defeat of France; and in January 1872 the chambers passed a law by which Rumania undertook to pay the railway coupons. The German syndicate was satisfied, and the railway crisis ended.

Catargiu's ministry was the tenth that had held office in five years since the prince's arrival, but it was the first one that was stable. In March 1875 the budget for 1876, amounting to £4,000,000, nearly double in amount that of the year 1866, was passed without difficulty, and on the 28th of the month the parliamentary session closed. It was the first occasion in Rumania that the same chamber had sat for the whole constitutional period of four years, and also the first time that the same ministry had opened and closed the same parliament.

Only the fall of the Catargiu ministry saved the country from revolution. The leading Liberals promoted a conspiracy for the arrest and expulsion of the prince, and the formation of a provisional government under General Dahia. The prospect of a return to power put an end to these machinations. Catargiu's ministry was succeeded by an administration under General Florescu, known as "the cabinet of the generals," and, a month later, by the so-called "ministry of conciliation," under M. Jepureanu. A commission of the chambers drew up an indictment against Catargiu and his late colleagues, accusing them of violating the constitution and the public liberties, squandering the state revenues, and other abuse of power. Unable to stem the tide of popular passion, which was crying for the impeachment of Catargiu, Jepureanu resigned office, and Bratianu formed a new Liberal cabinet, destined to guide the country through many eventful years.

The re-opening of the Eastern Question was destined to bring to a climax the great struggle of Rumania for existence and independence, and temporarily to throw into the shade all domestic questions. The insurrection in Bulgaria, with its accompanying horrors, followed by the deposition of Sultan Murad and the succession of the sultan Abdul Hamid, contributed to indicate the near approach of a Russo-Turkish war. Russia had shown symptoms of anger against Rumania for not having taken up a decided attitude in the approaching struggle, and the Russian ambassador Ignatiev had some months previously threatened that his government would seize Rumania as a pledge as soon as the Turks occupied Servia and Montenegro. Prince Charles decided to send a mission, composed of Bratianu and Colonel Slanicu (the minister of war), to the imperial headquarters at Livadia. They were well received by the emperor (October 1876), but in spite of mixed threats and cajoleries on the part of Gorchakov, Ignatiev and others, Bratianu returned without having definitively committed his country to active measures.

On the 14th of November six Russian army corps were mobilized to form the army of the south under the grand duke

---

1 For biographical details, see Charles, king of Rumania; and Elisabeth, queen of Rumania.
Nicholas. A few days later two secret envoys arrived at Bucharest, the one M. de Nelidov, to negotiate on the part of the Russian government for the passage of their army through Rumania, the other Ali Bey, to arrange on behalf of the sultan a combination with Rumania against Russia. Prince Charles cleverly temporized with both powers. Negotiations with Russia were continued, and Bratianu was sent to Constantinople to put pressure upon Turkey to secure certain rights and privileges which would practically have made Rumania independent, except that it would still have paid a fixed tribute; but the conference of the powers assembled at that capital came to a definite end on the 10th of January 1877, when the Turkish government declined every proposal of the conference. Meanwhile the Porte, in issuing Midhat Pasha’s famous scheme of reforms, had greatly irritated Rumanian politicians by including their country in the same category as the other privileged provinces, and designating its inhabitants as Ottoman subjects. A secret convention was signed between Russia and Rumania on the 10th of April, by which Rumania allowed free passage to the Russian armies, the tsar engaging in return to maintain its political rights and to protect its integrity, while all matters of detail connected with the passage of the Russian troops were to be regulated by a special treaty. On the 23rd of April Russia declared war against Turkey, and the grand duke Nicholas issued a proclamation to the Rumanian nation, announcing his intention of entering their territory in the hope of finding the same welcome as in former wars. The Rumanian government made a platonic protest against the crossing of the frontier, and the Rumanian troops fell back as the Russians advanced; provisions and stores of all kinds were supplied to the invading army against cash payments in gold, and the railways and telegraphs were freely placed at its disposal. The Rumanian chambers were assembled on the 26th of April, and the convention with Russia was sanctioned. The Ottoman government immediately broke off diplomatic relations with Rumania, and on the 11th of May the chambers passed a resolution that a state of war existed with Turkey. (For a detailed account of the subsequent campaign, in which Prince Charles and the Rumanian army contributed greatly to the success of the Russian armies, see Russo-Turkish Wars, and Plevna.) The fall of Plevna placed the Rumanian army free to march on Constantinople, and on the 4th of January 1878, the terminities of peace were signed at Adrianople. They stipulated that Rumania should be independent and receive an increase of territory.

Peace between Russia and Turkey was signed at San Stefano on the 3rd of March. On the 29th of January the Rumanian agent at St. Petersburg was officially informed of the intention of the Russian government to regain possession of the Rumanian portion of Bessarabia, i.e. that portion which was ceded to Moldavia by Russia after the Crimean War. Rumania was to be indemnified at the expense of Turkey by the delta of the Danube and the Dobrudja as far as Constantza. The motive assigned was that this territory had not been ceded to Rumania, but to Moldavia, and had been separated from Russia by the almost obsolete treaty of Paris (1836). But the proposed exchange of territory aroused the most bitter indignation at Bucharest. Bratianu and Cogălniceanu were sent to Berlin to endeavour to prevail on the representatives of the Powers there assembled in June 1878 to veto the cession. The Rumanian delegates were not permitted to attend the sittings of the congress until the Powers had decided in favour of the Russian claim. The treaty of Berlin in dealing with Rumania decided to recognize its independence, subject to two conditions: First (Art. xlv.), that the principality should restore to the emperor of Russia that portion of the Bessarabian territory detached from Russia by the treaty of Paris in 1856, bounded on the west by the mid-channel of the Pruth, and on the south by the mid-channel of the Kilia branch and the Staryi Stambul mouth. Second (Art. xlv.), that absolute freedom of worship should be granted to all persons in Rumania; that no religious beliefs should be a bar to the enjoyment of any political rights; and, further, that the subjects of all the powers should be treated in Rumania on a footing of perfect equality. Article xlv. declared that the islands forming the delta of the Danube, the Isle of Serpents, and the province of Dobrudja, as far as a line starting from the east of Silistria and terminating on the Black Sea south of Mangalia, should be added to Rumania. Other articles defined the international position of Rumania, while Article liii. decreed that it should have a representative on the European commission of the Danube. Bratianu wrote with some truth that the Great Powers by sacrificing Rumania were able to obtain more concessions for themselves from Russia, and Lord Beaconsfield was constrained to admit that “in politics ingratitude is often the reward of the greatest services.” The Rumanians submitted reluctantly to the retrocession of Bessarabia; and the Dobrudja was occupied by Rumanian troops on the 26th of November 1878.

But Article xlv. of the treaty of Berlin caused tremendous agitation throughout the country, and almost provoked a revolution. Article vii. of the constitution of 1866 laid down that “only Christians would be naturalized in Rumania.” In other words, all Jews were excluded from the rights of citizenship; and as no foreigner could own land in Rumania outside the towns, no Jew could become a country proprietor. Public opinion in Rumania rendered it almost impossible for any government to carry out the wishes of the Berlin tribunal. To do so involved a change in the constitution, which could only be effected by a specially elected constituent assembly. This body met on the 3rd of June, and sat through the entire summer. The irritation of the powers at the unexpected delay was so great that Great Britain proposed a collective note on the subject, to be executed by the Austrian cabinet; while Prince Bismarck threatened, if the Berlin proposition were not carried out, to refer to the suzerain power at Constantinople. At last, however, on the 18th of October, Article vii. was repealed, and it thus became possible for Rumanian Jews to become naturalized and to hold land. It was further decided to admit to naturalization the 883 Jewish soldiers who had served in the war; but with all other Jews individual naturalization was required, and this was impossible to so many difficulties, a special vote of the legislature being required, with a two-thirds majority in each individual case, that although the compromise thus effected was accepted by the powers, the actual result was that, from 1880 to 1884, out of 385 persons who were naturalized in Rumania, only 71 were Rumanian Jews. As the process of naturalization has never been accelerated, the 300,000 Jews said to inhabit Rumania are still regarded as foreigners; and although liable to military service and to the payment of taxes, are unable to own rural land or possess electoral or other civil rights.

Italy was the first of the Powers to notify its recognition of Rumanian independence (December 1879); but Bismarck succeeded in prevailing on the Western Powers not to give official recognition until Rumania should have purchased the railways from their German owners. This unpopular measure caused some delay; but eventually, Great Britain, France and Germany formally recognized the independence of the country on the 20th of February 1880. Early in 1881 it was generally felt that the time had arrived for Rumania to be created a kingdom. On the 13th of March the tsar Alexander II. was assassinated, and the Rumanian opposition chose this occasion to accuse the Liberal government of aiming at republican and anti-dynastic ideals. To refute this charge, the ministry proposed the elevation of the Rumanian principality into the kingdom of Rumania. The prince accepted the resolution; within ten days the new kingdom was recognized by all the Great Powers, and the coronation took place at Bucharest on the 22nd of May 1881. The royal crown was constructed of steel made from Turkish cannon captured at Plevna.
RUMANIA was now comparatively, but not entirely, free from fears of serious foreign complications. Austria and Russia alike resented the decision to fortify Bucharest and the Sereth line, adopted by the Rumanian government in 1882. Relations with Russia had remained strained ever since the war. The delimitation of the Dobrudja frontier was still unsettled, and owing to Russian opposition it was not finally disposed of until 1884. Expenses incurred during the war led to much controversy, especially when the Russian government claimed the return of £120,000 advanced to enable the Rumanians to mobilize, and considered by them as a free gift. A compromise was made, both parties withdrawing their claims, in April 1882.

Relations with Austria-Hungary were also on a very unpleasant footing. There were two principal subjects of discord— the navigation of the Danube (q.v.) and the “national question,” i.e. the status of the Vlach communities outside Rumania, and especially in Transylvania and Macedonia (see VLACHS AND MACEDONIA). The Danube question became acute in 1881, 1883 and 1889; the national question is a more permanent source of trouble, affecting Austria-Hungary, Greece, Turkey and Bulgaria. King Charles, who naturally favored territory of Germany, and Bratianu, who regarded Russian policy with suspicion, endeavored to promote a better understanding with Austria-Hungary. But there was a strong anti-German party in the country, especially among the old boiers and the peasantry. Community of creed, ancient traditional influence, the entire absence of Russian merchants, and the consequent avoidance of many small commercial rivalries, contributed to bring about a sort of passive preference for Russia, while the bitter disputes that had occurred with Germany on the question of railway finance had left a very hostile feeling.

In March 1883 the government decided to introduce various important changes into the constitution. Three electoral colleges were formed instead of four; a considerable addition was made to the numbers of the senate and chamber; trial by jury was established for press offenses, except those committed against the royal family and the sovereigns of foreign states; these were to be tried by the ordinary tribunals without jury. A bill was passed endowing the crown with state lands, giving an annual rent of £24,000. In addition to the civil list fixed in 1860 at £40,000, another measure granted free tenancy on the crown lands and an allowance of £1 daily during the sitting of parliament to all senators and deputies. The revision of the constitution had estranged the two heads of the Liberal party, I. C. Bratianu, who was mainly responsible for the new measures, and C. A. Rosetti, who unsuccessfully advocated reforms of a far more democratic character. These two had been united by a most intimate friendship. One had never acted without the other. Rosetti was said to be the soul whilst Bratianu was the voice of the same personality. Henceforward Bratianu had sole control of the Liberal government. The revising chamber having fulfilled their special mandate, were dissolved in September 1884, and a new parliament assembled in November, the government, as usual, obtaining a large majority in both houses.

Since 1876 Bratianu had exercised an almost dictatorial power, and anything like a powerful parliamentary opposition had ceased to exist. But he had been too long in power; the numerous state departments were exclusive of his nominees; and some pecuniary scandals, in which the minister of war and another high officials were implicated, helped to augment his fast-growing unpopularity. New parties were formed in opposition, and the National Liberal and Liberal-Conservative parties combined to attack him. The first of these maintained that the government should be essentially Rumanian, and, while maintaining friendly relations with foreign Powers, should in no wise allow them to interfere with internal affairs. They also advocated reduction of expenditure and the independence of the magistracy. The Liberal-Conservatives held generally the same views, but had as their ideal of foreign policy a guaranteed neutrality. Another party which now attracted considerable attention was that of the Junimists, or Young Conservatives. The name was taken from the Junimea, a literary society formed in Jassy in 1874 by P. Carp, T. Rosetti, and Maiorarescu, and transformed into a political association in 1881. Their programme for home affairs involved the amelioration of the position of the peasantry and artisan classes, whose progress they considered had been overlooked, the irremovability of the magistracy, and a revision of the communal law in the sense of decentralization. In financial matters they advocated the introduction of a gold standard and the removal of the agio on gold, also the introduction of foreign capital to develop industries in the country; and as regards foreign policy, they were strong advocates of intimate and friendly relations with Austria-Hungary. Elections for a new chamber took place in February 1885, and the whole of the leaders of the opposition were elected, including Dimitrie Bratianu, the premier's brother, and Lascar Catargiu. I. C. Bratianu definitely retired on the 4th of April, after having held the premiership for twelve eventful years. Had he continued much longer in office it is probable that there would have been a revolution in the kingdom.

During the previous parliament a Conservative manifesto, signed by Catargiu, D. Bratianu and other leaders of the opposition, openly threatened that if the ministers were not removed before the general election, the responsibility would be thrown, “not on those who served the crown, but on him who bore it”; and the name of Prince George Biscescu had been openly mentioned as a possible successor.

In the new chamber elected in October 1888 only five members of Bratianu's party retained their seats. The most prominent statesman in the new Conservative-Junimist administration was P. Carp, who in the spring of 1889 succeeded in passing a bill which authorized the distribution of state lands among the peasantry. Despite this admirable measure, he was unable to retain office, and three changes of ministry followed. The Conservative-Junimist parliament nevertheless restored tranquillity to the country. On the 22nd of May 1891, the 25th anniversary of the king's accession was celebrated with great enthusiasm. Meanwhile the gold standard had been adopted (1889), and the financial measures were satisfactory. In December 1891 a stable cabinet was at last formed by Lascar Catargiu. The new ministry during their four years' tenure of office passed several useful measures through parliament. The state credit was improved by the conversion of the public debt; the sale of the state lands to the peasantry was actively continued; a law was passed making irremovable the judges of the court of appeal and the presidents of tribunals, and other important judicial reforms were carried out; a mining law was passed with the object of introducing foreign capital; and the commercial marine was developed by the formation of a state ocean service of passengar and cargo steamers. Great reforms, which had been unsuccessfully attempted by former governments, were made in the service of public instruction and in the organization of the clergy. In 1893 and 1894 commercial and extradition treaties and a trade-mark convention were made with Great Britain, Austria-Hungary and Germany. Meanwhile the Liberal opposition was being reorganized. On the death of I. C. Bratianu, in 1891, his brother Dimitrie was proclaimed chief of the united Liberal party, but he also died in June 1892, when the statesman Dimitrie Sturdza was recognized as the head of the Liberals. In 1894 he started a very violent agitation in favour of the Rumanians in Hungary. Another popular opposition cry was “Rumania for the Rumanians.” The new mining law, among other concessions, gave foreigners the right to lease lands for long periods for the working of petroleum, and this was denounced by the opposition as being hostile to national interests, and also as being against the spirit of the constitution,
which prohibited foreigners from holding lands. The bill was carried by the government in April 1895, as well as another important measure favouring the construction of local railways by private contractors. The Liberal opposition protested, retired from the chamber, and took no further part in legislative proceedings. The Liberal party had been out of office for eight years, the Conservative-Junimist coalition had practically carried out its complete programme, and legislation was at a deadlock owing to the abstention of the Liberal opposition. As the electorate showed itself in favour of a change of ministry, Catargiu resigned, and a new Liberal government was formed by D. Sturza.

The advent to power of a statesman who had recently been making such violent attacks on the Hungarian government caused some anxiety in Austria-Hungary. When once office was obtained, it was to the interest of the new government that the agitation should subside. The official opening by the emperor of Austria of the new channel through the Iron Gates of the Danube, on the 27th of September 1896, was the means of bringing about a great improvement in the relations between the two countries. It led to an exchange of visits between the emperor and King Charles, who also visited the tsar Nicholas II. in August 1898. The visit was the symbol of a reconciliation between the Rumanians and the Russians, the relations between whom had been the reverse of cordial since 1878. As regards home politics, the overwhelming majority of the Liberal party at the elections of 1895, instead of being a source of strength, proved the very reverse. It caused the party to split up into factions—Sturdzists, Aurelialists and Flevists, so called after the names of their respective chiefs. Sturza himself soon had to retire. The head of the Orthodox Church, the metropolitan Gennadius, had for some years past, as head of the philanthropic foundations established by the princess Brancovan, desired to obtain the entire management of these wealthy foundations, and had made violent attacks on the two administrators, Prince George Bibescu and Prince Stribe, both members of the Brancovan family. In the quarrel that ensued the prelate was openly accused of simony, of heresy, and other matters more suitable for a criminal court. After a public trial before the Holy Synod, he was found guilty of certain canonical offences, and sentenced to be deposed. The same night, he was seized by the police, and removed by force to a neighbouring monastery. This harsh treatment of the head of the Church led to an attack on Sturza. On the 3rd of December 1896, the president of the council, M. Aurelian, was assassinated. This was a blow to the Liberal party, the object of calming public opinion by the settlement of this question. Aurelian then appealed to the patriotic sentiments of the Conservative party to help to solve the difficulty, and with the aid of Lascar Catargiu and Tache Ionescu the following decision was reached: the Holy Synod was to reverse its judgment, and the metropolitan was to be restored to his ecclesiastical rank; but, after holding it for a few days, he was voluntarily to resign and to receive as compensation a handsome pension. Calm was thus restored, but Aurelian and his colleagues were not inclined to hand over their portfolios to Sturza and his partisans. The struggle terminated in the success of Sturza, who in April 1897 returned to power and remained president of the council until 1899. Few of the important measures promised in the liberal programme were passed, one for the reform of public instruction being the most notable. Sturza's government, which had risen to power mainly on the national question, was also destined to fall on it. A popular agitation was raised on the subject of certain subsidies made by the Rumanians for the support of the Rumanian schools at Kronstadt in Transylvania, and Sturza was accused of too great subserviency to the Hungarian government. The agitation culminated in street riots at Bucharest. On the same evening that Sturza tendered his resignation to the king (April 1899) the veteran Conservative statesman Lascar Catargiu suddenly died.

The Conservatives, led by G. G. Cantacuzene, returned to office with an overwhelming majority. They were immediately confronted by an acute economic crisis. The financial position of the country had hitherto on the surface been very satisfactory. The public debt, mostly placed in Germany, amounted to about £51,000,000. The interest had been regularly paid. But the facility with which money had always been borrowed gave rise to great extravagance. Expenses which ought to have been defrayed out of the ordinary budget, such as the erection of magnificent public offices at Bucharest, were frequently defrayed out of the loans; and the custom had arisen when money was scarce of issuing treasury bonds. When the Conservatives came into office they found that the payment of 2½ millions of these bonds would shortly become due, and there were no resources in the treasury to meet them. Owing to the Transvaal War and other causes, the money market was most unfavourable, especially in Germany; and there was an almost entire failure of the harvest. The value of cereals exported in 1898 was about £7,000,000, in 1899 only £3½ millions. The government managed to extricate itself from its immediate difficulties in the autumn of 1899, by raising a loan of £7,000,000 in Berlin, but on very stringent terms. Besides paying a much higher rate of interest than heretofore, it bound itself not to contract any further loans until this one was paid. The Conservatives were united in wishing to meet the financial crisis by a moderate reduction of expenditure and a large increase of taxation, while the Liberal opposition advocated the permanent reduction of the annual expenditure of £800,000, which would necessitate the raising of £200,000 only by fresh taxation. The Conservative programme was naturally unpopular; Carp and the Junimists were unwilling to co-operate with the government, and, on the 20th of February 1900, D. Sturza again became premier. His administration lasted until the 31st of December 1904, and averted the impending bankruptcy of Rumania by a policy of strict retrenchment. In 1904 Sturza was able to exceed the proposed limit of annual expenditure, £8,740,000, owing to a great increase in the value of the tobacco monopoly. Even a recurrence of agricultural depression during the same year left the national credit intact. Another financial reform was undertaken by the Conservatives, who returned to power on the 4th of January 1905, with G. G. Cantacuzene as prime minister, and in May floated the conversion loan, already described.

The chief causes of the agrarian insurrection in March 1907 have been outlined above (under Land Tenure). But an additional cause was the harsh treatment of the Jews in the Reign of 1907.

Rumania and the Macedonian question.
propaganda most often refers to Rumanian nationalism. An
iradie of the most significant Rumanian public figures, the
Kutzu-Vlachs, as part of the influential "Rumanian school,"
and forming an integral part of the Rumanian Church. This
decision was regarded by the Greeks as a blow to their own
interests, and Greek revolutionary bands were accused of
persecuting the Kutzu-Vlachs. (See also MACEDONIA.) Even
before 1906 there had been rivalry between Greece and
Rumania, and the "Macedonian question" was the under-
lying cause of the disputes which, arising ostensibly from
to the rupture of diplomatic relations between Greece and
Rumania in 1905, 1906, and 1910.

BIBLIOGRAPHY.—No scientific history of Rumania was published
up to the 20th century, but the task of collecting and editing original
documents was partially carried out by the Rumanian Academy and
to a certain extent by students, especially after 1850. The so-called
Chronicle of Hurul, a modern forgery, and to the 14th century
the only valid authorities are Slavonic, Hungarian, and Byzantine
chronicles. Thenceforward a great mass of material is available.
It is partly preserved in the yearly Annalele de istoria Românilor
2nd series, from 1880; and in the 30 volumes of E. de Duremuziak's
Documente privind o parte de istoria Românilor (Bucharest, 1876,
&c.). Other important original documents, or works containing
such documents, are De la origine et du drapeau des Roms, by
Moldavie, Transilvania, to Kovachich's Scripores rerum Hungar-
carum minores (Bucharest, 1798); G. Urechia's late 16th-century
Chronique de Moldavie, ed. J. Picot (Paris, 1878); Rumanian text
in Old Slavonic characters, with French translation and notes of
oara, Dacie, and Transilvania; and Thesaurus de la
România, ed. V. A. Urechia (Bucharest, 1886); A. M. del Chiari,
"Istoria moderni rezoluta della Valacchia con la descrizione del paese (Venice,
1798); the early 18th-century Opretele principale D. Comaru,
edit., Bucharest, 1838; the 16th- & 17th-century documents,
more recently, of the transatlantic" romani, by
the so-called
Lamachine, Mémoire sur l'état ancien et actuel de la Moldavie,
presented à S.A.S. le prince A. Ypsilanti in 1787 (Bucharest, 1902); D. A.
Sturdza, Acte și documente referitoare la istoria românilor (Bucharest,
1903, &c.), ed. J. Picot; E. D. Xemeno, Istoria Românilor din Dacia Traiană (Jassy, 1888-93, 6 vols.,
— abridged French edition entitled Histoire des Romainiens, 2 vols.,
Paris, 1896); and P. Negulesco, Histoire du droit et des institutions de
la Roumanie (Paris, 1894, &c.). The above authors are given in A. Sturdza,
"La terre et les races roumaines" (Paris, 1905); and W. Miller, The Balkans (London, 1896). For a comprehensive
bibliography of Rumanian history, see N. Iorga's introduction to vol.
9 of his work, Notice historique, Politique et Social de la
Bibliografia Românească veche 1508-1830, by C. Bianu and H. Hodos

române (Bucharest, 1898).

LANGUAGE

Rumanian is, geographically, an isolated eastern member of
the group of Romance languages (g.e.), being squeezed from all
the rest by countries in which the predominant speech is Slavonic
or Magyar. It represents the original rustic Latin of the Roman
provincials in Moesia and Dacia, as modified by centuries of alien
rule. Structurally, it shows characteristics that have been well
preserved; but its vocabulary has undergone great changes,
becoming so far Slavonized that the ratio of words of Slavonic
origin to words of Latin origin is approximately as three to
two; large numbers of loan-words have also been added from
Turkish, Greek, Magyar and other sources. It is noteworthy,
however, that where Latin words have survived they are
sometimes purer than in the Romance languages of the West
11 The so-called Daco-Rumanian, spoken by the vast majority
of Romans over the whole of Rumania, in Transylvania, Bukovina,
the Carpathians, and the western part of the Roman province of
Bithynia, is very much like the dialect spoken by the Rumanians
on the south bank of the Danube. The two most important dialects are
the Istro-Romanian, spoken in part of Istria but rapidly becoming
extinct, and the Macedo-Romanian, spoken by the Kutzu-Vlachs
(see CHRONICLE). The Istro-Romanian forms, as it were, a link—now
completely severed—between the Romance of the Balkans and the
Romance of the West. In the Macedo-Romanian there are no
Magyar loan-words, but there is a large Albanian element, and Greek
loan-words are more numerous than Slavonic.

(e.g. Lat. domina is better represented by Rum. donna, "lady," than by Ital. donna, Span. doña, Port. dona, Fr. dame). Some
Rumanian words indeed have a laudable, to retain unaltered to lead
retain unaltered the forms under which they were used by Virgil and Cicero. A feature of the language which dis-

RUMANIA

LITERATURE

The intellectual development of Rumania has never until modern times been affected by Latin culture, but it has been profoundly influenced first by Slavonic literature, then by the Greek or Byzantine literature, and last, by the Western, notably French and Italian novels. The history of Rumanian literature can be divided into three distinct periods: the Slavonic, from the beginnings of Rumanian literature, the middle of the 16th century down to 1750; the Greek, 1710-1830, corresponding with the era of Phanariote rule; and the modern period, from 1830 to the present. The change from Slavonic to Rumanian was very gradual. Slavonic had been the language of the Church from the early middle ages, and was therefore hallowed in the eyes of the people and the clergy; through the political connexion with the Slavonic kingdoms of the south, Bulgaria and Servia, it had also been the language of the chancelleries and of the court. Even when the Rumanian language at last supplanted the Slavonic, it did not emancipate itself from the original; the new was merely a translation from the old, and at the beginning it was as literal as possible. We have therefore in the first period a medieval literature transplanted to Rumania and consisting of translations from the Slavonic. The reason of the change from Slavonic into Rumanian is to be sought in the influence the Reformation had among the Rumanian inhabitants of Transylvania.

The second period is marked by a complete waning of Slavonic influence, through the literary activity of the Greek hospodars. The Slavonic kingdoms of the south had lost their independence; they had ceased to produce anything worth having, whilst the Greeks brought with them the old literature from Byzantium and thus drove out the last remnants of Slavonic. They also treated Rumanian as an uncouth and barbarian language, and imposed upon the Church their own Greek language, Greek literature and Greek culture. This literature may be taken to represent the period of the Renaissance in the West; but when the yoke of the Phanariotes was shaken off, the link that connected Rumanian literature with Greek was also broken, and under modern influences began the romantic movement which has dominated Rumanian literature since 1830.

Much of the Rumanian literature of the first two periods has been preserved only in MSS.; few of these have been investigated, and a smaller number have been reproduced with their original. The Rumanian Academy keeps jealously watch over the treasures it has accumulated, and few have had access to the riches entombed in its archives; nor has any private or public collection been catalogued. An exhaustive history of Rumanian literature is, for the time being, a pious wish.

First Period: 1550-1710—Rumanian literature begins, like all modern European literature, with translations from the Bible. The oldest of these are direct translations from Slavonic texts, following the original word for word, even in its grammatical construction. The first impetus towards the printing of the Rumanian translations came from the necessity felt in Transylvania. It is under their orders and often at their expense that the first Slavonic printing-presses were established in places like Kronstadt (Brashov) Orșia, Sâschești and Belgrad (Alba Iulia) (Transylvania) whereas Slavonic and Rumanian books appeared. The foremost printer and translator was a certain Diaconus Koresi, of Greek origin, who had emigrated to Walachia and thence to Transylvania. He was assisted in his work by the "popes" (parish priests) of those places where he worked. The very first book published in Rumanian is the Gospel printed in Kronstadt between 1560 and 1561. An absolutely identical Slavonic text of the Gospel appeared in the same year, or one year earlier, which no doubt was the original for the Rumanian translation. Following up the list of publications of the books of the Bible in chronological order, we find Diaconus Koresi immediately afterwards—

The Bible.

A MS. Psalter more recently discovered shows close affinity to this edition, and, in spite of the opinions held by some critics, must be considered as a copy of it made about 1585; it even reproduces the verse numbers. In this copy, errors of transcription begin to belong to the first attempts to translate the historical books of the Old Testament which appeared in Orșia in 1582, under the title Psaita. The example thus set could not fail to react upon the Rumanians of the south and with whom Koresi was in commercial and political connexion. The Slavonic language still reigned supreme in the Church; yet once the example had been set in Transylvania, and the influence of the Slavonic nations had begun to slacken, it was inevitable that the Rumanian language should sooner or later come to its own. It was in Transylvania that the first complete Rumanian translation of the New Testament appeared (Belgrad, 1648). This translation was based upon the Slavonic original, but this had been translated into a Calvinistic translation, and had been collated with the Greek.

The chief author of this translation, which may be termed classical, seems to have been a certain Hieronim Sylvestre who lived in Walachia and who had undertaken, by order of the prince Biserica, to translate the whole Bible. Upon this version, no doubt, are based the editions of Fârâdash Cantacuzene (Bucharest, 1682), and that of Şerban Greceanu (Bucharest, 1693), in which for the first time the Greek text is printed side by side with the Rumanian. The Rumanian text was collated with the Hebrew, and the Greek original of the Old Testament which appeared in Orșia in 1582, under the title Psaita.

In these editions may be traced a few reminiscences of the older version by Koresi, of which a copy, made by Radu Gramatic (1574), and once the property of Peter Cercel, is now in the British Museum; these reminiscences are perhaps not even those of a part of his Bible (Belgrad, 1631), verifying the text by reference to the Hebrew and Greek originals. The first edition of the complete Bible was published (1688) by order of Prince Ioan Şerban Cantacuzene, who himself translated Genesis and the New Testament and by Metroman the bishop of Buzău. This may be considered as the supreme monument of Rumanian literature in Walachia in the 17th century. No other Rumanian translation approaches it in importance. In the 18th century we find a number of older translations, and for the New Testament and the Psalter they utilized Sylvestre's work. At least a hundred years had to pass ere a new edition of the whole Bible was undertaken, nor was the task had been completed, and corrected, by comparison included in the lessons read in church. These were compiled independently by Dositheu under the title of Pirstirat (Jassy, 1683), and were almost the last work that came from his prolific pen. As far back as 1593 Dositheu had made a new translation of the Psalter from the Slavonic, and in the prayerbooks printed in 1660-61. Upon this translation he based the rhyâmed Psalter at which he had worked from 1660-73, when it appeared in Unie. This is the first example of rhyâmed psalms in Rumanian, the author following the Polish model. Koresi had translated a French rhyâmed Psalter into Hungarian (1667) and this served as the basis for a liturgical translation made by Janos Viski (1697). About the same time Teodor Kurbca attempted to vary the Psalter and dedicated his work to Peter the Great of Russia. A new translation of the Psalter from Slavonic, with a commentary, the first of its kind, was made in 1697 by Alexander Dascălul (Alexander Preceptor Polonus). All these last-mentioned Psalters were intended for the church.

Turning from the Bible to homilies and the liturgy, we find the ancient collections of homilies in Rumania to be due to the same proselytizing movement. Almost the first book printed by the Sfântu Gheorghe Monastery of the extension of the Salve (Foro Mirlaus, c. 1570), seems to have been a translation from some classical compilation of homilies, one for every Sunday in the year. A Slavonic original sent by the metropolitan Serafin of Walachia served as the basis for a second collection of homilies known as Evanghelul teiului (dialogues, 1580), where the rhyâmed tendency and tendency and proves that Koresi was only a translator and printer. The first collection of homilies, henceforth known as Careni, appeared in Diligiope, i.e. Chițchir, in Walachia, in 1645, and is compiled from the homilies of the Russian Orthodox Church. Very voluminous is the next collection, Evanghelul teiului (translated from the Russian by Sylvestre (Govan, 1643). One year later appeared the first book printed in Moldavia, the collection of homilies Carte românească de iemânt (Jassy, 1643). It is a volume of 1000 folio pages, of which the first half is absolutely identical with Sylvestre's collection. A similar unacknowledged loan was made by Meletie the Macedonian, compiler of the homilies which appeared at Deal in 1644. Of special interest
is the next publication of homilies Cheoa intelesului, "the Key of understanding," by the Walachian metropolitan Varlaam, translated from the Greek and printed at Bucharest in 1678. This, the first book printed in Bucharest, begins the long series of editions which characterized the early press of the town. From this press originated also the no less important presses at Buzet and Rămnicu Valcea, where in the following two centuries almost all the books for the Church service were printed. Two or three more long-lived presses remained—those of the "Golden treasury," by Ioan of Vinti (Sasebehes, 1668), also from some Hungarian Calvinistic collection of obituary sermons; and the "Pearls, Margăriare, an anthology made from the Greek Formulary of the Church."

The most important formulary known to Walachian literature, the "Formulary of the Saints," was printed from the press of the Church of Sinaia, &c., and translated from the Greek by the brothers Radu and Serban Grecianu. This was the first to issue books in Arabic and even in Georgian from his printing-presses in Bucharest. The Didaskal were published at Bucharest in 1888.

Since the Rumanian language was not yet introduced into all the Church service books were printed in Slavonic, but during this period most of them were translated, and some of them printed, although not yet officially used. The burial service seems to have been the first to be printed. Two Ectoigia appeared in the second half of the 17th century, the first, the Didashie (Jassy, 1679), which remained almost unknown, and the other based upon the Slavonic, by Ioan Vinti (Belgrad, 1689). This MS. hannas been the basis of all subsequent editions of the Rumania Pravilni. The Didashie was also translated by bishop Dosisbei in 1679, but a translation from the Greek, by Jeremias Kakavela (Jassy, 1697), was the one adopted in the churches. Passing over the numerous editions of the Akvaticus and other church books in both Rumanian and the language of the bishops, one finds the first time in Transylvania in 1696, but certainly printed or reprinted by the metropolitan Anthim the Iberian (Tirguvista, 1715). In 1694 Alexander Dascalu translated, and the bishops Mirzan of Buzet and the metropolitan of Rămnicu Valcea printed (among other church books) the twelve volumes of the Mineu in Slavonic with Rumanian rubrics, and short lives of the saints, as well as the Triod and the Anthology. In 1696 the first edition of the church books in Rumanian was published in Bucharest; there was also a Roman Catholic propaganda in Rumania, and the Orthodox Church found it necessary to synode in Jassy for the purpose of formulating anew its own dogmatic system. It was during the 17th century that the present form of the Orthodox creed was drawn up. An answer to the Lutheran Catechism of Heidelberg (translated into Rumanian and printed at Fogaras in 1649) was also prepared by Bishop Varlaam K. Grecianu translated the formulary from Greek into Rumanian under the title Pravilnicii mănăstiriști (Bucharest, 1692). Of more decided polemical character is the Luminous of Maximi of Polpennous, translated from the Greek (Bucharest, 1699). This work is concerned with the lives of saints, real or apocryphal, intended to teach by example. Such are the maxims, from the Evangelia, translated from the Greek (Sneagov, 1700), and going back to the Italian Fiore di Ginestra, or the "Life of St. Christopher," by Daniel of Filoteiu (ibid., 1700), the short moral guide, Carare pre scurt, by Ioan of Vinti (Belgrad, 1685), translated from some Hungarian original; the Mănăstirea paschiolos, or "Salvation of sinners," a translation of the first book of the Ponticulus, which is a house of a medieval exemplum; and above all the Mirror of Kings, ascribed to Prince Neagoe Basarab, written "originally in Slavonic (or Greek, if the prince was really the author), and published in 1699, a work which is considered the first attempt to give a popular exposition of its class in purity of language and excellence of style. Of the lives of saints, the Prolog, translated from the Slavonic at the beginning of the 17th century (MS.), and the Veliep Similor, by Ioan Bacelari (Bucharest, 1696), are the most important books. The second of which is a popular exposition of the latter, which is his greatest work. Dosisbeiu uses not only Greek texts, but also Slavonic legends and other MS. material; and he includes a good number of the apocryphal legends of saints. To this kind of literature belongs also the Lifestyles, i.e., the Historia Lausiacon of Pauladiua, differing, however, in some points from the original. The legends of the saints of the Pecheria were in Katharina in Kiev were printed by Alexander Dascalu. All these are still in MS.

Law

Rumania. In 1640 there appeared in Govora the first canonical law book, printed by the first Rumanian book printed in Walachia. This Praviln (code) was printed by the historian Moxa or Moxalea. In 1652 Evtregi the Logoteot (logoteo) also translated a Praviln from the Greek, which remains in MS. In 1652 appeared the Praviln alama, or "Selected Code," compiled, no doubt, by Evtregi. It was published with the written consent of the then reigning Prince Vasile Lupul (Basil the Wolf), hence known as the Code of Vasile. In 1652 there appeared in Bucharest a complete code of laws, translated from the Greek and Slavonic and adapted to local needs under the direction of the prince of Walachia, Matthias Bassaraba. The Indreptarea legii, in which Praeval of Vasile was incorporated without acknowledgment, remained the supreme law book in Walachia down to 1676. It embraces the canons as well as the civil law. The chief authors were Uril Năsturel and Danil M. Panomeanul.

The earliest historical works are short annals, written originally in Slavonic and then called the "Great Imperial Chronicle of the Byzantine emperors," it includes the legend of Troy, the history of Pope Sylvester and the description of the various church councils; and it concludes at the year 1636. The second is the History of the Domesday Book, written in Slavonic by a certain Ion Buburea. Both are still in MS. The Old Slavonic chronicles were later on translated and new notes were added, each subsequent writer annexing the work of his predecessor, and prefixing his name to the entire compilation. Ancient Rumanian chronography is thus difficult to unravel. In Moldavia, where the influence of Poland had been great and Western writings were accessible, we find the best chronicles. The writers are often actors in the drama of history, and also the vicissitudes.

The first to be printed in Transylvania in 1696, but certainly printed or reprinted by the metropolitan Anthim the Iberian (Tirguvista, 1715). In 1694 Alexander Dascalu translated, and the bishops Mirzan of Buzet and the metropolitan of Rămnicu Valcea printed (among other church books) the twelve volumes of the Mineu in Slavonic with Rumanian rubrics, and short lives of the saints, as well as the Triod and the Anthology. In 1696 the first edition of the church books in Rumanian was published in Bucharest; there was also a Roman Catholic propaganda in Rumania, and the Orthodox Church found it necessary to synode in Jassy for the purpose of formulating anew its own dogmatic system. It was during the 17th century that the present form of the Orthodox creed was drawn up. An answer to the Lutheran Catechism of Heidelberg (translated into Rumanian and printed at Fogaras in 1649) was also prepared by Bishop Varlaam. K. Grecianu translated the formulary from Greek into Rumanian under the title Pravilnicii mănăstiriști (Bucharest, 1692). Of more decided polemical character is the Luminous of Maximi of Polpennous, translated from the Greek (Bucharest, 1699). This work is concerned with the lives of saints, real or apocryphal, intended to teach by example. Such are the maxims, from the Evangelia, translated from the Greek (Sneagov, 1700), and going back to the Italian Fiore di Ginestra, or the "Life of St. Christopher," by Daniel of Filoteiu (ibid., 1700), the short moral guide, Carare pre scurt, by Ioan of Vinti (Belgrad, 1685), translated from some Hungarian original; the Mănăstirea paschiolos, or "Salvation of sinners," a translation of the first book of the Ponticulus, which is a house of a medieval exemplum; and above all the Mirror of Kings, ascribed to Prince Neagoe Basarab, written "originally in Slavonic (or Greek, if the prince was really the author), and published in 1699, a work which is considered the first attempt to give a popular exposition of its class in purity of language and excellence of style. Of the lives of saints, the Prolog, translated from the Slavonic at the beginning of the 17th century (MS.), and the Veliep Similor, by Ioan Bacelari (Bucharest, 1696), are the most important books. The second of which is a popular exposition of the latter, which is his greatest work. Dosisbeiu uses not only Greek texts, but also Slavonic legends and other MS. material; and he includes a good number of the apocryphal legends of saints. To this kind of literature belongs also the Lifestyles, i.e., the Historia Lausiacon of Pauladiua, differing, however, in some points from the original. The legends of the saints of the Pecherska in Kiev were printed by Alexander Dascalu. All these are still in MS.

Influence at Rumania Catholicism

Second Period: 1710-1830—The Phanariote period has been described as one of total decay; the political degradation of Rumania was thought to be reflected in its spiritual life. But the facts do not warrant this opinion. The few who had taken the trouble to study Rumanian literature paid not the slightest attention to the vast MS. material accumulated during the years of the Phanariote dominion, and out of sheer ignorance and political bias condemned this period as sterile. Another influence was far more potent than the conduct of the Greek princes, though some of them were real benefactors of the people. In Transylvania one section of the Rumanian population had accepted the spiritual rule of the pope; they became now Greek-Catholic, inscribed the Greek Orthodox. Rome took good care to educate the Rumanian Orthodox priests, and continued an extensive proselytizing activity. So long as the Rumanians were spiritually united with the other Orthodox nations, and so long as they used the Slavonic or Cyrillic alphabet, they would practically be cut off from the Latin West. If, however, they could be induced to discard the old Slavonic alphabet and substitute for it the Latin, and could be brought to recognize their national and ethnical unity with ancient Rome, it was hoped that then they would be more easily induced to enter into the unity of faith. Thus a great change was wrought towards the end of the 18th and in the
first half of the 19th century in the whole current of Romanian literature. It suited the promoters of that movement to pretend that they started a new era. But the Latin or Transylvanian movement brought great havoc in Romanian literature and caused the greatest confusion in the language. Only now are some authors beginning to free themselves from the evil influence.

By the end of the 17th century Rumanian had become the authorized language of the Church, and the Rumanian translation of the Gospels (printed 1693) had become the Authorized Version. Most of the liturgical books officially adopted and revised in this period were also used by church services in the Carpathian mountains, revised by Bishop Nicolae of Râmnicu Vâlcea (1745), the Euhologion (1764), the Kataphnesta (1753). The monumental publication of the Lives of Saints, also in 12 huge volumes, by Bishops Kesarel and Filaret, Râmnicu Vâlcea (1776-80), is certain importance if it be not superior to the less monumental publication of the Lives of Saints, also in 12 huge volumes, printed under the direction and with the assistance of the metropolitan Vesanin of Moldavia. The latter was translated into Russian, appeared in Neamtuz (1809-12), and was reprinted in Bucharest (1835-36). In beauty, richness and lucidity of language, and in dignity of style, these two books resemble the Bible of 1688.

Shocked at finding these sources, many Rumanian writers and translators turned to Greek originals and for more than a century were busy translating into Rumanian the most important works of the older Fathers of the Church. Some of these translations were so successful that they were printed in Russia. The Great and (of Epiphanius) translated in the middle of the 18th century, was printed in Bucharest in 1827. The Scala Coeli of Joh. Klimakus, the Treasury of St. Damascen us (MS. 1747 by a certain Mihalaca), the Summa Theologica of St. Thomas Aquinas, the Psalter of the Syrian, were printed at Neamtuz in 1818. The Panoplia of Euthymius Zygabenus (1775) and the Commentary of Theophylyct on the Bible were printed by Veniamin (Jassy, 1805). The homilies of Theodor Studescu (1805) were also published in Bucharest. The Psalter at Râmnicu Vâlcea in 1784; a translation of Gregory of Nazianzus appeared at Bucharest in 1727. The great polemical work of Simeon of Tessonolica, the Greek original of which was published by Bishop Kesarel, in the early 18th century, had been translated into Rumanian before it was printed (Bucharest, 1756). The Lapsatikon, mentioned above, was printed at Bucharest in 1754. All these translations are written in good Rumanian. One can see how a language not oriental, which had been exposed to many influences, was slowly but surely improved and made capable of expressing profound and subtle ideas.

In Transylvania, with the conversion to Greek-Catholicism of Bishop Athanasius in 1701, the Greek Orthodox had to place themselves down to 1850 under the protection of the Servant metropolitan of Karlowitz. No writer of any consequence arose among them. The Uniate "fared better, and many a gifted young Rumanian was sent there to be trained from the sources of Greek observation and occasionally also temporal promotion. With a view probably to counteract the literary activity in Rumania, the bishops P. F. Aaron and Ioan Bobb were indefatigable in the translation of Latins' books into Rumanian. Bishop Cornar Iosif of Bucovina, who translated the Bible was undertaken by Samuel Klain. It appeared in Blaț (1793-95). It falls short of the older version of 1688; it was modernized in its language, and no doubt a careful examination would reveal deep marks of his control. Most of the authorized books published in this style, in which the Catholic tradition differs from the Eastern. Bobb translated Thomas à Kempis's Imitatio Christi (Blaț, 1812); he wrote a Theologia moralis (ibid. 1801) and adapted the Rumanian service to the new order of things. Popular catechisms and various histories of the Church were then written. Mention may be made of a few more moral treatises such as the Șapă pocați, "Gate of Penitence" (Kronstadt, 1812); Oglinda omului din punctul moral (1815); the "Philosophical Saws and Maxims" (Tîrgoviste, 1715). The most important was the collection of fables with their "moral" translated and modified from the Servian of Obrenovich—Fabule moralești, by Tâzdeanul (Budapest, 1814). These are heavy and follow the original too literally. Tâzdeanul (d. 1818) and his contemporaries in Hungary had lost contact with the Rumanian literature in Walachia and Moldavia, and the same was the case with the other writers of the Greek books. The most prolific was the Walachian boyar, who was one of the first Rumanians to describe a journey in Western Europe, is also the author of a collection of maxims and parables, Adumare de padele hiștorice și filosofice (Bucharest, 1807) and a larger collection in MS. partly edited by him in his Proverbs Rominilor (Bucharest, 1817).

After 1727 Rumanian was recognized as the language of the law-courts, and through the annexion of Bukovina by Austria (1774) and of Bessarabia by Russia (1812), codes for the civil law and political administration of those provinces were drawn up in Rumanian, either in accordance with the established law of the land or in consonance with the laws of Austria and Russia. Such legal codes reflect the German or Russian original. They were, however, of importance as they served as models (to some extent) for the new legislative code compiled in Moldavia under Prince Caliman; this was originally published in Greek (1816), and afterwards in Rumanian by the Api of Asaki (Jassy, 1833). The Walachian civil laws and local usages were collected and arranged under the direction of Prince Ypsilanti (1780) in Greek and Rumanian; and under Prince Caragases another history of the country was published in Rumanian in 1832, when the "Organic Law" changed the whole trend of legislation. One more collection, an abstract from the Greek Basilica, published by Donici (Jassy, 1814), must be mentioned, for through it the legal terminology of the modern codes was more or less founded. It might be mentioned here, the "Organic Law" was translated into prose, and the Arabian Nights, after undergoing an extraordinary change in Italian and modern Greek, appear in Rumanian literature at the middle of the 19th century under the name of Hâtalin. The Glycor and his manuscripts (19th century) seem to have found their way into the Rumanian literature. The epic of Vincenzo Comnaro was translated into prose.
with verse, first under the name of Evocari and then slightly changed as Filor și Antusa. Anton Fann printed it as his own composition. Kriti și Andronius (Jassy, 1794) is almost the last novel or story translated direct from the Greek. The young men of Walachia had come into contact with Western literature, which they were anxious to transplant to their own country. Some had been sent to Paris for their education, such as Poteca, Marcovic, the Voinescus, Moroiu and others, who developed an almost feverish activity in translation. Most of the writings of Florian, Marmontel, Le Sage, Montesquieu and some of the French romantic writers were translated by various Walachian scholars. A novel Lizarde de Tornes also found its translator, and appeared in 1839, Paul and Virginia in 1831. Campe’s German Robinson Crusoe (1816) and his Discovery of America were translated by D. Bratianu & C. Bratianu. The same year Belinin developed a similar activity. Beldinam copied a number of ancient chronicles, wrote a satire on the Greeks, and translated and adapted a number of French tragedies and dramas, in verse and prose.

Nowhere were they more important than in the history of civilization than in Walachia and Moldavia, more in the former than in the latter. It formed the rallying-ground for the new generation which chafed under the tyranny of a Greek court. A certain Aristide, of Greek origin, who was accustomed to his surroundings as teacher at the high school in Bucharest, was the first to adapt foreign dramas for the Rumanian stage. These were first performed in Greek and afterwards translated into Rumanian. The plays produced on the Rumanian stage included most of the dramas of Molire, some of Corneille, Kotsbue and Metastasos, whose Achille in Schiro was the first Rumanian play translated into Rumanian (by Iordache Stăineanu, printed at St Petersburg 1797). Schiller was also translated, and a few plays of Shakespeare (Hamlet & Macbeth). Hugo’s Angelo and Maria Tudor were translated by Constantin Negrunț. Those who kept in touch with the old literature—men such as Beldinam, Marcovic and Negrunț—were able even in their very youth to deal with the great for the same time not to distort the character of the Rumanian language. Among such translators was Skavinschi, who came originally from Transylvania to Jassy, and translated Regnald’s Democrit into verse. The lyric poetry of the Rumanian 19th century, produced some of the most popular poets. Among them were Vasile Aaron (1770-1822) and Ion Barak (1779-1848). Aaron wrote the Passion, in 10,000 verses (1802; often reprinted); the gloomy and pessimistic Socrat & Hristi (1821); and the humorous Leonat și Donoflos, a satire on bad women and on drunken husbands, now a chapbook. Barak wrote Răsăritirea Iesuismului (1821), “The Destruction of Jerusalem,” almost as long as Aaron’s Passion; and he versified a Magyar fairy tale, a Hungarian romance which had previously been interpreted as a political poem with a hidden meaning. He also translated the Arabian Nights from the German. In Walachia a certain Ion Budai Deleanu, a man of great learning, author of a hit-and-miss, satirical epic on the Walachian peasants. Velcu’s Văzăre are of similar type. Deleanu’s satirical epic won in which gipsies play the chief part. It is called Tișanița (1812) and consists of 12 songs and of many thousand verses. The author displays a profound knowledge of the life and the manners of the great variety of scenes and sounds from the folk literature from the Batrâncuțamachia to the Pucelă of Voltaire.

The love-songs of the time are primitive imitations of the Neo-Greek lyric dithyrambs and rhapsodies, which through the teaching of the Greek churches Walachia were considered as the fountain of poetic inspiration. But a closer acquaintance with the West led to greater independence in poetical composition. In the three generations of the Văcărescu one can follow this process of rapid evolution. I. Văcărescu, author of the first native Rumanian grammar on independent lines, was more inclined toward poetry, following Greek examples. He then studied Italian, French and German poetry, and made translations from Voltaire and Goethe. His son Alecu (1795) followed his example. Both were for a time in partnership, and both were attacked as plagiarists by anyone other than any other man both the representative of an epoch fast vanishing and the harbinger of the new spirit that was stirring young Rumania. The collected poems of I. Văcărescu were published in 1834. Alecu’s Văcărescu was an able and popular poet like his father, although the poet is not as adventurous as his father. Alecu, which were confused with his own work. In this volume, Colectă din poezii domnilor mare logofet I. Văcărescu, there are odes, hymns, patriotic poems, ballads, lyrical and didactic poems, some works of old Princely times, the best of the works of Alecu. They have been published in the Caracal (Bucharest, 1828) Latin forms are common. One more poet, and a real one, is Vasile Carău (1809–1831), whose Raimes of Vărgoșnuicc sufficed to place him among the foremost Rumanian poets of the 19th century.

In Moldavia a similar development took place, translations leading up to independent production. The most prominent figure is that of the scholar and linguist Constantin Konaki (1777–1849), who might be termed the Rumanian Longfellow for the facility and felicity of his translations from Western poetry and for his short poems, easily set to music and very popular. His Alcolūri și Lăzărcei appeared in 1858. Constantin Negrunț, who was at first influenced by the Russian poets, notably Pushkin, successfully translated poems of Victor Hugo, and rivalled Konaki in his dexterity and fidelity to the original.

**Third Period: 1830–1871.**—The agitation for the transliteration of the alphabet, the elimination of all non-Latin words from the language and the ostracism of the old literature, completely crippled all literary activity, first in Transylvania and then in Rumania. The Latin movement was first brought into Walachia by a certain George Lazar from across the mountains. Lazar was appointed teacher at the St Sava school of Bucharest, where he spread the new doctrine of the Latin origin of the Rumanians; Latinizing tendencies were, however, not yet imported into the language. Of his pupils there was one whose influence became decisive: Ion Eliade (Heliade), afterwards also known as I. E. Bocșa, an act of immense influence, of great power of initiative and of still greater imagination. He it was who ushered in the new epoch, and for close upon forty years he stood at the head of almost every literary undertaking.

There were two periods in his life—the latter the exact opposite and negation of the former. Up to 1848 he was closely connected with the Latinists and the school—he was the successor to Lazar; he wrote grammars, and the introductions to his grammars are models of lucidity, combined with a wide historical view. He was the founder of the first political and literary review, and he had a great deal of eminence and the merit of assisting it. Through his reviews he trained the middle-class to read and to take an active interest in literary problems. Through his Curier de ams sezo (1837–41) he disseminated transmissions from political and other works. He began a new period of development, and the period of change of 1848. About this time he turned to philosophy and fell into the Transylvanian school. Slowly he developed his theories about language and writing, and he ended as a fanatic wedded to extra-ordinary views. He was a prolific writer and translator of dramas and romances, often translated from French into Rumanian, and mostly in his periodical. The number of his publications is legion.

All the prominent Rumanians of that period were politicians; they strove to obtain the emancipation of the country from Turkish domination and to break the power of Walachia. Everything was placed at the service of this national aspiration, which is the keynote of the poems of Bolintineanu (1826–1873). He also was discovered by Rădulescu, who published his first and best known poem, The Dying Virgin. In 1848 he was exiled, together with the other leaders of the revolution, and he spent the next nine years in travel in the East. There he gathered the materials for his lyrical poems “Macedone” and “Florice Bofororul” returning in 1857 to Wallachia, he occupied high administrative posts, and he wrote up to the Spanish historical novels (Traian, Mireca, Stafan, &c.), dramas (Lăpușaneau, Mihnea, Mihaiu, &c.), longer poems (Sorin, Conrad), and his political-philo-sophical novel Elena. These mostly Romantic compositions were as rule less felicitious than his political, the latter appearing mostly in his periodical. The number of his publications is legion.

A contemporaneous poet Bolintineanu was Grigore Alexandru (1817–1849), who, with a pupil, Eliade, was the origin of his rhythm and his poetry, his poetry of a didactical nature, and his best poems are rhytymes fables, many of which are thinly disguised political satires. He also translated the Alace (1818) of Victor Hugo, and a number of other satirical poems may be mentioned G. Creteanu (1829–1887) and A. Silheanu (1834–1857), who left some weak poems of a sentimental and patriotic character. A Deparațion (1835–1865), which language shows traces of the Latin, and the Caracal, which in the hands of Nicolae (1853–1871), whose powerful poems, full of deep and often tragic feeling, lead on from Alexandru to Eminescu, all three being the poets of pessimism. In Teodor Sebiș (b. 1839) we find the reflex of Bolintineanu of the earlier period, in the beauty and simplicity of his lyrical poems—not yet published in complete form. Like Bolintineanu, Vasile Alecsandri (1821–1890), the greatest of Rumanian lyrical poets (see ALECSANDRI), was a Moldavian. In France, under the influence of Béranger and the romantic school, he was led to turn to popular
apoetry for inspiration. He collected Rumanian popular songs and ballads (Doine, 1844) (Lăcramioare, 1853). In Postelari
Ales-
sandri (1867) he introduced admirable pictures of popular life into
Rumanian poetry. In Legende (1871) and Ostazii nostri
(1877) he continued his efforts on the
tone of poetry alone, which retains some of the charm of popular poetry.
Alesandri is less successful in his dramas, most of which are adapta-
tions from French originalis; the only merit of his novels is that
amid the pretentious and philological turmoil he kept to the puer-
lar language of the people.
From Alesandri there is a national transition to his great rival,
who was also his superior in depth of thought and in mastery of
language, the creator of the masterpiece of Rumanian romantic
poetry, Cemescu. E. Cemescu (1848). Mention may also be made of
Matilde Cugler Poni (b. 1853), who published some admirable short
poems in the Rumanian reviews (Poezi, 1888). Veronica Micle (1853–1886)
belonged to the group of women whose work was contemporaneous.
But all these men or women disappear with the appearance of
Eminescu, who, like Bolestineanu, started a new school of poetry
and left a deep and growing influence upon the new generation.
His poems express a theme, though possessing originality of its own, is A.
Vlahuţă (b. 1859). C. Volcu, who has depicted
the poet of the unfortunate Rumanian peasant, emancipated
only in name and on paper, and a prey to greedy landowners and to
a medieval administration. The poets of this school drew their
inspiration from the social and political upheavals of the age, and
lowered middle class or of peasants, who by dint of heavy work
and great hardship were able to rise above the narrow social condi-
tions in which they were born.
Somewhere in the development of the Rumanian
prose writers. They suffered in consequence of the philological
confusion brought about by Eliade and his assistants,
mostly men who after 1848 immigrated from Transylvania
and the Banat to the town of November.
Prose Writers.
One of the most important among these was the
Bălescu, was a consummate scholar of ancient and medieval
antiquities, and wrote a history of ancient art. His Pseudonymeticos is
an unsurpassed model of elegant writing and of fine irony.
What Alexander Dohotariu and Delia Stangaai have created
is the Rumanian historical novel, by his Mitmea Vedăt (1858) and
Doamna Kajna (1860). The first novel describing human nature in
everyday life is the Cocior echi și noi (1863) of Nicolae Filimon
(1850–1865). In Moldavia where the knowledge of the old
chronicles had not entirely died out and disturbing philological
influences were not so acutely felt, we find the vigorous writings of
Mihail Cogălînceanu—one of the leading spirits of the 19th century,
the greatest of the national founders of Rumanian literature. He
published various reviews, some of a political, others of a more
literary character, such as the Dacia literară (1840) and Archita
românească (1845–46); he has also the great merit of having published
for the first time a selection of the Rumanian religious
legends—several editions of which have been published since
(1785–1787), a second Eliade, to help in inaugurating a literary
reform in Moldavia; but the result was disappointing, until the
literary journal known as the Junimea was started, in the seventies, by
T. Titu (1830–1893), who edited it at first. Titu Maiorescu put a stop to the prevailing Latinism, and turned
the current of Rumanian literature into a more healthy channel,
by the publication of his Critice (1874).
Ioan Ghica, a contemporary of the revolutionaries of 1848,
was the first to collect and collate those agitated times into two volumes.
Aminiri (1890) and Scriitori către V. Alesadri (1887), which
besides their historical value have become a model of Rumanian
prose. Among writers of fiction three names stand out prominently:
F. I. Dinca, who published the narrative of two Transylvanian peasants,
in short stories, Nume din popor. Barbu Stefănescu de la Vrancea (b. 1858),
also wrote short popular stories characterized by a wealth of imagery and
richness of language; but the characters are all very unreal and not
enough a vivid picture of the modern Rumanian peasantry. Barbu
I. Dragomir (b. 1859), the most popular Rumanian dramatist of
modern times, who has brought on the stage living types of
the lower classes. His works are translated into various
languages, as are also the author of the powerful
short novel Pascale de pasă. Dobrogneanu Ghebca (b. 1853) has in his
Scrii critice (1890 sq.) been a ruthless but none the less judicious
critic.
Curiously enough, there is not a single novel in the Rumanian
literature with a sustained plot; none which presents a study of the
development of human character amid the multifarious vicissitudes of
life. The reason for this deficiency is perhaps the unsettled
conditions of Rumanian life, and the lack of a profound and long-
established civilization; or it may be found in the unstable
fickle character of the people. Whatever the cause may be, while
Rumanian poetry could well compare with that of any Western
nation, in the domain of prose writing, and of novels in particular,
one must look to the future to fill up the gap now existing.
There existed in Rumania another set of literary monuments
at least as old as any of the books hitherto enumerated,
but which appeared to a wider circle. Rumanian
folk-literature contains both popular written books
and oral songs, ballads, &c. It is advisable to group
the material in three sections: (1) the romantic
and secular literature; (2) the religious literature—both
-Prose literature:
folklore, Ballads, Tales.

To the first belong the oldest books, such as the History of
Alexandru the Great, which was known in Rumania in the 17th century.
It rests mostly upon a Slovacko-Greek text and is of the utmost
interest for the study of this cycle of legends. The first
printed copy appeared in 1794, and has been reprinted in innumerable
editions. Some of the Seven Masters has also been
written— and (3) the modern collections
of ballads, songs, tales, &c.

It rests mostly upon a Slovacko-Greek text and is of the utmost
interest for the study of this cycle of legends. The first
printed copy appeared in 1794, and has been reprinted in innumerable
editions. Some of the Seven Masters has also been
written. In addition to these there is the history of St Sylvester and the
conversion of Constantine, &c., all still in MS. The History of
Constantine the Great was published in 1769 in MS. And
Asaki Titu, in addition to an
history of the
people, has also mentioned a for the people not so much for its
religious interest as for the romantic career of the hero.

The parables and parables contained in the legend were incorporated
in their oral form in the collection of legends called the
similar original impression is the Dream of Mamer, the interpretation
of which goes back to the Pancharanta, and must have reached
Rumania early in the 18th century, probably in Slavonic. The
first collection of legends by M. Nasi, printed in 1681, is
translated from the Greek version. To the same
The first cycle of oriental tales belongs to the B photographers, already
mentioned, which G. Jorciu (printed 3 vols., 1835–37) as his own
work. The second cycle of oriental tales belongs to
another MSS, in the black MSS, in the new famous Old Testament
apocryphal of
The Wise, mentioned in Tobit and found in many languages.
In Rumania it rests on an older Greek-Slavonic text, and owes
much of its charm to its folkish manner of describing
the story. Besides the edition of the Rumanian church service-books
with musical notation, he published a series of tales, proverbs and
songs either from original texts or from oral information; and he made
a large collection of proverbs ingeniously connected
with one another and leading up to or starting from
a popular tale exemplifying the proverb. The Fabule et anecdotes
(1812–1815) is a collection of short popular stories in
the Hospital of Love (1850–53), with tunes either composed by himself
or obtained from the gypsy musicians who alone performed them.
Of his numerous writings two or three are of the greatest interest
for the student of Rumanian language and literature; and

Far larger than the secular is the religious popular literature; it
comprises many apocryphal tales from the Old and the New
Testa-
mints, and not a few of the heretical tales circulated in the various
sects of Asia Minor and Thracia, which percolated into Rumania
through the medium of Slavonic. A brief enumeration of the

848
RUMANIA

[LITERATURE]
chief tales must suffice. Only a few of them have hitherto been published. They exist in numerous MSS., which testify to their great popularity; in the popular songs one finds many traces of their influence upon the people's imagination. They include the *Apostles*, the *History of the City*, the *Legends of Solomon*: numerous New Testament apocryphal tales, starting with legends of St John the Baptist; a very remarkable version of the *Gospel of St Thomas*; *Apocalypse of Peter*; and thousands of copies are certain apocalyptic legends dealing with eschatological problems. The ancient *Apocalypse of Peter* appears here under the name of Paul, then there is an *Apocalypse of the Virgin Mary*, who, like Peter, is carried by the Archangel through the Heaven. In the *History of the City*, and through whose intervention sufferers are granted pardon on certain days of the year. Combined with these is the *Sunday Epistle*, sent from Heaven, enjoining strict observance, not only of Sunday, but also of Fast. W. W. (vol. i., pp. 97-107). Most of the tales date in their Rumanian form from the 16th and 17th centuries; the *Sunday Epistle* is well known in connexion with the Flagellants. In the same pamphlet as the *Sunday Epistle* was published the legend of St Sisoe and sometimes that of N. P. who saved the children of his sister from the attacks of the devil, who had devoured them and had to restore them alive; the latter is the female child-stealing demon, who is prevented by an angel from carrying out her evil design. In both cases the repetition of the same ideas is striking, and it would appear that the tales borrowed, like some other tales, apocryphal and otherwise, as amulets, to protect from the devil. Upon the recitation of some of these texts rest many popular charms and incantations. Therein lies their power, and their efficacy, for to those who have not clued to much that now lives in the mouths of the people, and is by some considered to be of immemorial antiquity. A number of astrological calendars and *prognosticae* are among the best known and oldest. One would hardly conceive that tales of love and the lives of St Alexius, Xcphonon, &c. have become chapbooks.

The whole of this popular literature belongs to what may be called the cycle of the Balkan nations, in every one of which exact parallels can be found. Not only the legends, but also the deliberate borrowing by one nation from the other, but all of them have stood for a long time under identical psychological influences and have developed on similar lines. The superstitions of one are often found to be those of the others, and in such a form as they could not have been taken over independently from a third source; they show too much family likeness. Thus also the popular songs of Rumania, the “doine,” the “hora,” the “cântec”, “colinde”, “legende,” i.e. the love songs, the heroic ballads, legends, songs at the ring-lance, hymns and carols, the tales of Argesh, or the ballad of Jorgovan, found in the Malorussian Byliny. One of the first to collect these treasures of Rumanian poetry was V. Alecsandri (1849–1896), who, however, retained only their poetical beauty, and worked in harmony with that strict accuracy which modern study of folklore demands. A. M. L., who collected those of Transylvania (1896); S. F. Marian, those of the Bukovina (1873); T. T. Burada, those of the Dobrudja (1880); the most complete collection is that of G. Dem. Teodorescu, *Poezi popula de românie* (Bucharest, 1885). The collection of fairy tales started later than that of the ballads. The first collection is the German translation of tales heard by the Brothers Schott (1845). The most important collections, now deservedly considered as classical from every point of view, are the successive publications of P. Ispirescu. The collected tales of the Moldavian Ion Creanga (1837–89) appeared in his *Opere complete* (1938). Excellent collections are those of D. Stancescu, *Opere* (1885–1893); I. G. Mironescu, *Poezi de românie* (1885–1889). The whole of the tales and folklore will be found in G. Weigand, *Die Aromaten*, vol. ii. The only review devoted to the study of folklore is the *Zesate*, founded in 1902.

In this period of stagnation there has seemed to have overtaken Rumania, and although attempts have been made to place the intellectual life of the nation on a sounder basis, the work of transition from the past to the present has hitherto absorbed more energy than appears necessary. Whatever the causes may have been, the fact remains that now there is a great dearth of talent and great poverty in output.

**RUMELIA, or RUMELI** (Turkish Rumili, “the land of the Romans,” i.e. the East Roman or Byzantine empire), a name commonly used, from the 15th century onwards, to denote that part of the Balkan peninsula which was subject to Turkey. More precisely it was the country bounded N. by Bulgaria, W. by Albania and S. by the Morea, or in other words the ancient provinces, including Constantinople and Salonica, of Thrace and Macedonia. The name was ultimately applied more especially to the province composed of central Albania and western Macedonia, having Monastir for its chief town. Owing to administrative changes effected between 1870 and 1875, the name ceased to correspond with any political division. Eastern Rumelia was constituted an autonomous province of the Turkish empire by the Berlin treaty of 1878; but on the 18th of September 1885, after a bloodless revolution, it was united with Bulgaria (q.v.).

**RUMFORD, BENJAMIN THOMPSON, COUNT (1753–1814),** British-American man of science, philanthropist and administrator, was born at Woburn, in Massachusetts, on the 26th of March 1753. The Thompson family had been settled in New England since the middle of the previous century, and belonged to the class of moderately wealthy farmers. His father died while he was very young, and his mother speedily married a second time. But he seems to have been well cared for, and he was at the age of fourteen sufficiently advanced in algebra, geometry, astronomy, and even the higher mathematics, to calculate a solar eclipse within four seconds of accuracy. In 1766 he was apprenticed to a storekeeper at Salem, in New England, and when he had become an able merchant, he occupied himself in chemical and mechanical experiments, in which he attained to some proficiency. The commencement of the American War put a stop to the trade of his master, and he thereafter left Salem and went to Boston, where he engaged himself as assistant in another store. He was at that period between seventeen and eighteen years old, and at nineteen, he says, “I married, or rather I was married.” His wife was the widow of Colonel Benjamin Rolfe, and the daughter of Timothy Walker, “a highly respectable minister, and one of the first settlers at Rumford,” now called Concord, in New Hampshire. His wife was possessed of considerable property, and was his senior by fourteen years.

This marriage was the foundation of his success. Soon after it he became acquainted with Governor Wentworth of New Hampshire, who conferred on him the majority of a local regiment of militia. He speedily became the object of distrust among the friends of the American cause, and it was considered prudent that he should seek an early opportunity of leaving the country. On the evacuation of Boston by the royal troops, therefore, in 1776, he was selected by Governor Wentworth to be the representative of New Hampshire to England. On his arrival in London Lord George Germain, secretary of state, appointed him to a clerkship in his office. Within a few months he was advanced to the post of secretary of the province of Georgia, and in about four years he was made under-secretary of state. His official duties, however, did not interfere with the prosecution of scientific pursuits, and in 1779 he was elected a fellow of the Royal Society. Among the subjects to which he especially directed his attention were the explosive force of gunpowder, the construction of firearms, and a system of signalling at sea. In connexion with the last, he made a cruise in the Channel fleet, on board the “Victory,” as a volunteer under the command of Admiral Sir Charles Hardy. On the resignation of Lord North’s administration, of which Lord George Germain was one of the least popular members, he left the civil service, and was nominated to a cavalry command in the revolting provinces of America. But the War of Independence was practically at an end, and in 1783 he finally quitted active service, with the rank and half-pay of a lieutenant-colonel. He now formed the design of joining the Austrian army, for the purpose of campaigning against the Turks, and so crossed over from Dover to Calais with Gibbon, who, writing to his friend Lord Sheffield, called his fellow-passenger “Mr Secretary-Colonel-Admiral-Philosopher Thompson.” At Strassburg he was introduced to Prince Maximilian, afterwards elector of Bavaria, and was by him invited to enter the civil and military service of that state. Having obtained the leave of the

---

**RUMELIA—RUMFORD** 849
government to accept the prince’s offer, he received the honour of knighthood from George III., and during eleven years he remained at Munich as minister of war, minister of police, and grand chamberlain to the elector. His political and courtly employments, however, did not absorb all his time, and he contributed during his stay in Bavaria a number of papers to the *Philosophical Transactions*. But that he was sufficiently alert as the principal adviser of the elector the results of his labours in that capacity amply prove. He reorganized the Bavarian army; he immensely improved the condition of the industrial classes throughout the country by providing them with work and instructing them in the practice of domestic economy; and he did much to suppress mendicity. The multitude of beggars in Bavaria had long been a public nuisance and danger. In one day he caused no fewer than 2600 of these outcasts and depredators in Munich and its suburbs alone to be arrested by military patrols, and transferred by them to an industrial establishment which he had prepared for their reception. In this institution they were both housed and fed, and they not only supported themselves by their labours but earned a surplus for the benefit of the electoral revenues. The principle on which their treatment proceeded is stated by him in the following remark: “Shall I order the master of the workshops to make vicious and indolent people happy,” he says, “it has generally been supposed necessary first to make them virtuous. But why not reverse this order? Why not make them first happy, and then virtuous?”

In 1791 he was created a count of the Holy Roman Empire, and chose his title of Rumford from the name as it then was of the American township to which his wife’s family belonged. In 1795 he visited England, one incident of his journey being the loss of all his private papers, including the materials for an autobiography, which were contained in a box stolen from off his postchaise in St Paul’s Churchyard. During his residence in London he applied himself to the discovery of methods for curing smoky chimneys and the contrivance of improvements in the construction of fireplaces. But he was quickly recalled to Munich, being threatened at once by an Austrian and a French army. The elector fled from his capital, and it was entirely owing to Rumford that a hostile occupation of the city was prevented. It was now proposed that he should be accredited as Bavarian ambassador in London; but the circumstance that he was a British subject presented an insurmountable obstacle. He, however, again came to England, and remained there in a private station for several years.

In 1798 he presented to the Royal Society his “Enquiry concerning the Source of Heat which is excited by Friction,” in which he combated the current view that heat was a material substance, and regarded it as a mode of motion. In 1799 he, in conjunction with Sir Joseph Banks, projected the establishment of the Royal Institution. It received its charter of incorporation from George III. in 1800, and Rumford himself selected Sir Humphry Davy as scientific lecturer there. Until 1804 he lived at the Royal Institution in Albemarle Street, London, or at a house which he rented at Brompton, and he then established himself in Paris, marrying (his first wife having died in 1792) as his second wife the wealthy widow of Lavosier, the celebrated chemist. With this lady he led an extremely uncomfortable life, till at last they agreed to separate. He took up his residence at Auteuil, where he died suddenly on the 21st of August 1814, in the sixty-second year of his age.

Rumford was the founder and the first recipient of the Rumford medal of the Royal Society. He was also the founder of the Rumford medal of the American Academy of Arts and Sciences, and of the Rumford professorship in Harvard University. His complete works with a memoir by G. E. Ellis were published by the American Academy of Arts and Sciences in 1870-75.

**RūMĪ** (1207-1273). Mahommed b. Mahommed b. Husain albalkhi, better known as Maulānā Jalāl-uddīn RūMī (or simply Jalāl-uddīn, or Jalāl-eddīn), the greatest Sūfī poet of Persia, was born on the 30th of September 1207 (604 H. 6th of Rabī’ I.) at Balkh, in Khūrāsān, where his family had resided from time immemorial. He claimed descent from the caliph Abūbekr, and from the Khwārizm-Shāh Sūlān ‘Alā-uddīn b. Tukush (1109-1220), whose only daughter, Malikah-i-Jalāh, had been married to Jalāl-uddīn’s grandfather. Her son, Mahommed, commonly called Bahā-uddīn Walad, was famous for his learning and piety, but being afraid of the sultan’s jealousy, he migrated to Asia Minor in 1212. After residing for some time at Malatía and afterwards in England, Bahā-uddīn was called to Lāranda in Asia Minor, as principal of the local college. Here young Jalāl-uddīn grew up, and in 1226 married Jauhar Khâtūn, the daughter of Lālā Shāraf-uddīn of Samarkand. Finally, Bahā-uddīn was invited to Iconium by ‘Alā-uddīn Kaikūbād (1216-1236), the sultan of Asia Minor, and, as it is commonly called in the East, Rūm—whence Jalāl-uddīn’s surname (takhhaltus) RūMī.

After Bahā-uddīn’s death in 1231, Jalāl-uddīn went to Aleppo and Damascus for a short time to study, but, dissatisfied with the exact sciences, he returned to Iconium, where he became by and by professor of four separate colleges, and devoted himself to the study of mystical theosophy. His first spiritual instructor was Sayyid Būrān-uddīn Husainī of Tirmidh, one of his father’s disciples, and, later on, the wandering Sūfī Shams-uddīn of Tabriz, who soon acquired a most popular character as mystic and ascetic. Shams-uddīn’s aggressive character roused the people of Iconium against him, and during a riot in which Jalāl-uddīn’s eldest son, ‘Alā-uddīn, was killed, he was arrested and probably executed; at least he was no more seen. In remembrance of these victims of popular wrath Jalāl-uddīn founded the order of the Maulawī (in Turkish Mevlevi) dervishes, famous for their piety as well as for their peculiar garb of mourning, their music and their mystic dance (samā), which is the outward representation of the circling movement of the spheres, and the inward symbol of the circling movement of the soul caused by the vibrations of a Sūfī’s fervent love to God. The establishment of this order, which still possesses numerous cloisters throughout the Turkish empire, and the leadership of which has been kept in Jalāl-uddīn’s family in Iconium uninterruptedly for the last six hundred years, gave a new stimulus to his zeal and poetical inspiration. Most of his matchless odes were composed in honour of the Maulawī dervishes, and even his *opus magnum*, the Mathnawi (Mesnevi), or, as it is usually called, *The Spiritual Mathnawi* (mathnawi-i-ma’navi), in six books or daftars, with 30,000 to 40,000 double-thymed verses, can be traced to the same source. The idea of this immense collection of ethical and moral precepts was first suggested to the poet by his favourite disciple Hasan, better known as Husām-uddīn, who in 1258 became Jalāl-uddīn’s chief assistant. Jalāl-uddīn dictated to him, with a short interruption, the whole work during the remaining years of his life. Soon after its completion Jalāl-uddīn died, on the 17th of December 1273 (672 A.H. 5th of Jamādā II.). His first successor in the rectorship of the Maulawi fraternity was Husām-uddīn himself, after whose death in 1284 Jalāl-uddīn’s younger and only surviving son, Shāhī Bahāuddīn-īn Ahmad, commonly called Sultan Walad, and favourably known as author of the mystic mathnawi Rab’dīnma, or the Book of the Guitar (died 1312), was duly installed as grand-master of the order.

Jalāl-uddīn’s life is fully described in Shams-uddīn Ahmad Afshar’s *Mandāb-ul ur flu’fīn* (written between A.D. 1318 and 1353), the first part of which was written in Constantinople, and the second at Constantinople, in 1353, in the Redhouse in the preface to his English metrical version of The Mesnevi, *Book the First* (London, 1881); there is also an abridged translation of the Mathnawi, with introduction by E. H. Wharton (2nd ed. 1898). Complete editions have been printed in Bombay, Lucknow, Tabriz, Constantinople, and in Bulaq (with a Turkish translation, 1268 A.H.), at the end of which a seventh daftar is added, the genuineness of which is refuted by a remark of Jalāl-uddīn himself in one of the Bodleian copies of the poem, Ouseley, 294 (f. 328a seq.). A revised edition was made by ‘Abd-ullatif between 1024 and 1032 A.H., and the same author’s commentary on the Mathnawi, *Lātīf-ul-ulma’na*, and his glossary, *Lātīf-ul-ulaghī*, have been lithographed in Cawnpore (1876) and Lucknow (1877) respectively, the latter under the title Farhang-i-mathnawi. For the other numerous commentaries and for further biographical and literary particulars of Jalāl-uddīn, see Rieu’s Cat. of the Persian MSS.

RUMINANTIA—RUNEBERG

RUMINANTIA, a term employed by Cuvier to include all the existing artiodactyle ruminating ungulate mammals now classed under the groups Pecora, Tylopoda, and Tragulina. By Professor Max Weber it is employed as a collective designation for these groups, together with the extinct Anarcrotherioda and Dichobunioidea; but its use seems best restricted to a general term rather than a definite systematic group. (See ARTIODACTYLA, PECORA, TYLOPODA.)

RUMKER, CARL LUDWIG CHRISTIAN (1758-1862), German astronomer, was born in Mockenlen on 28th of May 1758. He served in the British navy from 1807 until 1817, and was director of the school of navigation at Hamburg from 1819 till 1820. In 1821 he went to New South Wales as astronomer at the observatory built at Parramatta by Sir Thomas Brisbane. He returned to Europe in 1830 and took charge of the observatory at Hamburg. His chief work was concerned with the cataloguing of stars: a preliminary catalogue of the stars of the S. hemisphere was published in 1832 at Hamburg, and in 1840-52 he published his great catalogue of 12,000 stars. In 1837 he went to reside at Lisbon, where he died on the 21st of December 1862.

His son, GEORGE FRIEDRICH WILHELM (1832-1900), born on the 31st of December 1832, at Hamburg, was astronomer at the observatory at Durham, England, from 1853 to 1856. He then became assistant at the Hamburg observatory, and in 1862 was appointed director of the same institution. From 1884 he was the Hamburg delegate for the International Earth Measurement. He died on the 3rd of March 1900.

RUNCIMAN, ALEXANDER (1736-1785), Scottish historical painter, was born in Edinburgh in 1736. He studied at Foulis's Academy, Glasgow, and at the age of thirty proceeded to Rome, where he spent five years. It was at this time that he became acquainted with Fuseli. The painter's earliest efforts had been in landscape; he soon, however, turned to historical and imaginative subjects, exhibiting his "Nausicaa at Play with her Maidens" in 1765 at the Free Society of British Artists, Edinburgh. On his return from Italy, after a brief residence in London, where in 1772 he exhibited in the Royal Academy, he settled in Edinburgh, and was appointed master of the academy in 1774. He was patronized by Sir James Clerk, whose hall at Penicuik House he decorated with a series of subjects from Ossian. He also executed various religious paintings and an altar-piece in the Cowgate Episcopal Church, Edinburgh, and easel pictures of "Cymon and Iphigenia," "Sigismunda weeping over the Heart of Tancred," and "Agrippina landing with the Ashes of Germanicus." He died in Edinburgh on the 4th of October 1785. His works, while they show high intention and considerable imagination, are frequently defective in form and extravagant in gesture. His younger brother, JOHN RUNCIMAN (1744-1786), who accompanied him to Rome, and died at Naples in 1766, was an artist of great promise. His "Flight into Egypt," in the National Gallery of Scotland, is remarkable for the precision of its execution and the mellow richness of its colouring.

RUNCORN, a market town and river-port in the Northwich parliamentary county of Cheshire, England, on the S. of the estuary of the Mersey 16 m. above Liverpool. Pop. of urban district (1901) 16,491. It is served by the London & North-Western railway, and has extensive communications by canal. The modern prosperity of the town dates from the completion in 1773 of the Bridgewater Canal, which here descends into the Mersey by a flight of locks. Runcorn is a sub-port of Manchester, with which it is connected by the Manchester Ship Canal, and has extensive warehouse and warehouse accommodation. The chief exports are coal, salt, and pitch; but there is also a large traffic in potters' materials. A transporter bridge between Runcorn and Widnes, with a suspended car worked by electricity to convey passengers and vehicles (the first bridge of the kind in England) was constructed in 1902. The town possesses shipbuilding yards, iron founders, rope works, tanneries, and soap and alkali works.

Owing to the Mersey being here fordable at low water, Runcorn was in early times of considerable military importance. On a rock which formerly jutted into the Mersey the Ethelheda erected a castle in 916, but of the building there are now no remains; while the rock was removed to further the cutting of the ship canal. Ethelheda is also said to have founded a town, but it is not noticed in Domesday. The ferry is noticed in a charter in the 12th century.

RUNDALE (apparently from "to run" and "dale," valley, originally something separated off, cf. "deal"), the name of a form of occupation of land, somewhat resembling the English "common field" system. The land is divided into discontinuous plots, and cultivated and occupied by a number of tenants to whom it is leased jointly. The system was common in Ireland, especially in the western counties. In Scotland, where the system also existed, it was termed "run-rig" (from "run," and "rig" or "ridge").

RUNEBERG, JOHAN LUDVIG (1804-1877), Swedish poet, son of a sea-captain, was born at Jakobstad, in Finland, on the 5th of February 1804. He was brought up by an uncle at Uleåborg, and entered the university of Åbo in the autumn term of 1822. In 1823 he broke off his studies to act as tutor in two quiet Finnish villages, Saariljärvi and Ruovesi, where he gained a thorough knowledge of the popular life and poetry, and on his return to Åbo he began to contribute verses to the local newspapers. In the spring of 1827 he received the degree of doctor of philosophy. The university had been removed after the great fire of 1827 to Helsingfors, where Runeberg became, in 1830, amanuensis to the council of the university. In the same year he published at Helsingfors his first volume of Dikter (Poems), and a collection of Serbiska folkåktar (Swedish folksongs) translated into Swedish. In 1831 his verse romance of Finnish life, Grafen i Perrho (The Grave in Perrho), received the small gold medal of the Swedish Academy, and the poet married Fredrika Charlotta Tengström, daughter of the archbishop of Finland. In the same year he was appointed university lecturer on Roman literature. In 1832 he published his beautiful little idyll, Elbskytarnerna (The Elk-Hunters); and in 1833 a second collection of lyrical poems. He founded in 1832 the Helsingfors Morgonblad, a paper which dealt chiefly with aesthetic and literary questions, and exercised great influence both in Sweden and Finland. In it appeared many of his own poems and tales. His comedy, Friaren från Landet (The Country Lover, 1834), was not a success, but in 1836 he published Hanna, a charming idyll of Finnish country life, written in hexameters. In 1837 Runeberg accepted the chair of Latin at Borgå College, and resided in that little town for the rest of his life.

He was now recognized in his remote Finland retirement as second only to Tegnér among the poets of Sweden. In 1841 he published Nadeschda, a romance of modern Russian life, and Juliskauren (Christmas Eve), another idyll of Finnish life. The third volume of his Dikter bears the date 1843, and the noble cycle of unrhymed verse romances called Kung Fjalar, the setting of which is taken from old Scandinavian legend, was published in 1844. Finally, in 1848, he achieved a great success both by his splendid series of poems on the war of independence in 1809 and his poems of terror and Finns fought side by side. The series bears the name of Fätor k Sids Stoger (Ensign Steel's Stories); a second series appeared in 1860. From 1847 to 1850 the poet was rector of Borgå College, a post which he resigned to take the only journey out of Finland which he ever accomplished, a visit to Sweden in 1851. In 1854 he collected his prose essays into a volume entitled Smårre Berättelser. In the same year he was made president of a committee for the preparation of a national Psalter, which
issued, in 1827, a poem-book largely contributed by Runeberg for public use. He once more attempted a comedy in his Kan ef (Can't) in 1862, and tragedy, with infinitely more success. In his stately Kungarne på Salamis (The Kings at Salamis) in 1861, Runeberg died at Borgå on the 6th of May 1877. His writings were collected by C. R. Nyblom in six volumes in 1870, and his posthumous writings in three volumes (1878–70).

The poems of Runeberg show the influence of the Greeks and of Goethe upon his mind; but he possesses a great originality. It is hardly possible to over-estimate the value of his patriotic poems as a link between the Swedish and Finnish nations. He has remained one of the most popular Swedish poets, although his whole life was spent in Finland.

An account of his life and works by C. R. Nyblom is prefixed to the Samlade Skrifter of 1870. For a minute criticism of Runeberg's principal poems, with translations, see Gosse's Studies in the Literatures of the North. A reprint of a portion of a poem was published in an English translation by Messrs Magnusson & Palmer in 1878. There are also monographs on Runeberg by Dietrichson and Rancken (Stockholm, 1864), by Cygnus (Helsingfors, 1873), by Ljunggren (Lund, 1882–83), and Pescher (Stuttgart, 1881).

RUNES, RUNIC LANGUAGE AND INSCRIPTIONS. The art of writing with an alphabet appears to have been introduced into Germanic Europe in the Iron Age. Something hieratic and mysterious was involved in the idea of letters as used to convey thought, and from the earliest recorded times they were called runes, from the Gothic runa (rin, in Icelandic), which originally means a secret thing, a mystery, and was later used to describe a letter of the ancient language (see Alphabet and Scandinavian Languages). The Iron Age is supposed to have existed from circa 200 to circa 650, and it is to the close of this epoch that the beginning of the writing on Scandinavian memorials is attributed. There are runes which have been discovered in England, and some also on the Germanic mainland of Europe, but it is in the Scandinavian peninsula that the vast majority of inscribed monuments have been discovered. The custom of erecting runic monuments, i.e. stones engraved in more or less literary statements, over the bodies of the dead, was practised first, there can be no doubt, in Norway and Sweden, then spread to Denmark and over the whole North of Europe. It is remarkable, however, that two of the three runic alphabets from which our knowledge of the whole range of rune-literature is founded, were discovered outside Scandinavia. These three alphabets exist, the first on a thin gold bracteate found in 1774 at Vadstena, in Sweden; the second on a bronze bracelet, dug up at Charnoy, in Burgundy; the third on a knife, found in the Thames in 1857, and now in the British Museum. There are two principal runic alphabets, the older consisting of 24 letters, and beginning with f; the later of 16 letters. During the last century before the introduction of Christianity, the larger alphabet was increased by 3 letters.

The oldest runes which have been examined are those found on the Thorshöj Shield-buckle, which is at present in the King Museum; hence the writing, which runs from right to left, in straight lines, is of the fourth or fifth century. Other invaluable sources of runic knowledge are the diadems of Straarup, the Vimose comb and the brooch of Himlingjöe, which was found in the Vier Fén. Still greater importance has the Golden Horn, discovered at Gellehus, near Tondern, in 1734; this monument was stolen by thieves and melted down, but fortunately not until a careful copy of it had been made, which is now in the Museum at Copenhagen. It is not until the 6th century that the runic stones begin. The most ancient are believed to be those of Einnang, of Tunes, of Strand, of Varnum, of Tanum and of Berga. Perhaps a little later are the stones at Vaanga, Skärkind, Skaaing, Torvik, Bö and others, too numerous to mention, but all, as seems likely, erected between 550 and 600. On the famous Tume-stone, the name of the author of the inscription is preserved, "I Wiwar made these runes," which, though this is not an isolated instance, the original direction of the runic writing was from left to right, like Latin, but quite early the reverse method was introduced. A union of these forms produced more complicated systems, in which much was left to the individual taste.

From the earliest times uninscription memorial stones in Scandinavia, bautasteinar, were raised to preserve the memory of the dead, and these certainly partook of a more or less religious and sacrificial character. It is evident that, during the Iron Age, stones continued to be erected which had no inscriptions, after the runic alphabets had been invented, and that at first the runes were added only in cases of great importance or solemnity. These runic stones were as a rule posed on the top of the grave, or by the side of it, on mounds, of which only one example survives, that of the stone of Einang, in Norway. But runic stones were not infrequently placed in the grave itself. These were smaller than those erected outside the grave, and they did not lend themselves to lengthy or elaborate inscriptions. The majority of graves containing such small rune-stones, bearing merely the name of the deceased or a magical sentence, have been found in Norway. But the antiquity of most of these is questioned, that of Vatn, which is the oldest, being now placed no earlier than the 8th century. The very important stone of Valsky, which is the oldest Norwegian monument employing the shorter alphabet, is attributed to Wimmer to heathen times, indeed, but to a date no earlier than the second half of the 9th century. It is supposed that the most ancient of the runic stones of Sweden, those respectively of Vånga, Skärkind and Kinneved, must have come from the interior of graves, but there is no certain proof of this. The latest criticism tends to the belief that when runes were first inscribed on Scandinavian monuments, they were placed both upon and inside graves, but that after the runic letters had been used for about a century, the latter custom tended to exclude the former. About the year 800 both customs began to invade Denmark, the practice of placing the rune-stones inside, however, soon getting the upper hand. It is a curious fact that in Iceland not a single rune-stone which can be referred back to heathen times is known to exist; the Icelandic runestones all date from a period well advanced in the middle ages. It was the old theory that the ancient stones had mouldered away under stress of weather, but that is abandoned, and it is now supposed that the aristocratic exiles from Norway, who settled in Iceland, had not yet adopted in their old home the practice of inscribed monuments to their dead. There were bautasteinar in Iceland, as we know, but there is no evidence that these bore runes upon them.

It is in Denmark that the runic inscriptions exist which possess the highest literary interest. These are all attributed to the beginning of the 9th century. The Kallerup Stone was discovered in 1826 at the village of Hjørring, a Danish mile E. of Roskilde; it has been lifted and placed in its original position. This monument contains a statement in old Danish, to the effect that it marks the grave of Hornbora, son of Swidi. The Stone of Skoddelev was discovered in 1768, not far from the spot where the Kallerup Stone was found; it is now in the National Museum at Copenhagen; this has a long and important inscription, but is of old Scandinavia, allied to the classical Icelandic. The Stone of Helnaes was found on the island of that name in 1860, and is now at Copenhagen. The other most famous runic monuments are those of Flemöe, Örja, Nörrenaer, Glarendrup, Fryggevælde and Røninge, of all of which Wimmer has published full analytical descriptions.

These inscriptions are of remarkable value as historical documents, from a period of which no other definite records remain in existence. From a literary point of view, they represent what Germanic language was up to the point at which Ulfilas created a new alphabet for his version of the Bible, by adapting to the runic alphabets a number of Greek letters. It was an error, now exploded, to suppose that the notae impressae, which Tacitus describes in his Germania, were written runes; these were simply signs, or mystic marks, which had no linguistic significance. These are described in the staves of the Edda as having been revealed to mankind by the god Odin.
and they were of a higgher character. The suggestion is that the
written runes were introduced from the south of Europe by a
Phoenician agency, and that they were copied from Greek or
Roman coins which had found their way to Scandinavia. In
several of the sagas it is recorded that runes were inscribed
on round pieces of wood, called keflí, or runic sticks. It has
been suggested that the Eddaic poems were preserved in this
way, but the only authority for this is that the Sonatorrekk is said
to have been taken down on a keflí. In Christian times runes
came to be regarded as an archaic curiosity, and were engraved
on sticks, chairs and spoons; a loto stick with runes on it is
preserved in the Bodleian library. In the Fornevíðgar runes
are mentioned as carved on the blade of an oar. Even cases
occur in which the normal Latin alphabet was called ráunamál
or a language of Runes. A runic letter was called a rúnastaf in
Icelandic.

Runden (Göttingen, 1821); Olsen, Runerne i den oldinslæske Literatur
(Christiania, 1891).

RUNG, a short round bar or stick used as a cross-bar or rail
in a chair, and particularly as one of the steps or rounds of a
ladder. In Scottish the word retains the original meaning of a
staff or stick, especially a short thick cudgel. The O.E. hrung
is used only of a bar or rail in a wagon; the word also occurs
in D.U. runge, beam of a plough, Ger. Rungen, pin, bolt.

RUNIMEDE, or RUNYMED, a meadow on the S. bank of the
river Thames, England, in the county of Surrey and the
parish of Egham. It is celebrated in connexion with the signa-
ture of Magna Carta (q.v.) by King John on the 15th of June
1215. It has been disputed whether the ceremony took place
actually in the meadow or on Magna Carta or Charter Island
lying off it. The charter itself indicates Runimeede by name,
but this may have included the island, which is the traditional
site and was in 1217 the meeting-place of Henry III. and Louis
(afterwards Louis VIII.) of France.

RUNING, the most ancient form of athletic exercise
considered as a sport. Athletic apparatus of every kind has
been improved in modern times, but the spiked running-shoe
may be said to represent the sole advantage enjoyed by the
modern runner over his Olympic prototype. As an athletic
sport running has been in vogue from the earliest times, and
the simple foot-race (δρόμος), run straight away from starting-
point to goal, or once over the course of the stadion (a little
over 200 yds.), formed an event in the Greek penteáthlon,
or quintuple games (see GAMES, CLASSICAL). It was diversified
with the race once over the course and return, and the διδύμος,
a long run many times (often as many as twelve, i.e. about
2½ m.) up and down the stadion. There was also the νόμος
πρακτική, a short race for warriors, who wore full armour
and carried sword and shield, which has been imitated by the
modern military race in full marching order. Except in the
warriors' race the Greek runners were naked, save occasionally
for a pair of light shoes. No records of the times made by the
runners in the Greek races have been handed down. It may
be interesting to note that the ancient Olympic chronicles preserve the memory of several runners,
of whom Ladas was the most conspicuous, who fell dead at
the completion of the long course, and were buried in state
with their brows encircled by the victor's chaplet. In ancient
Italy running was practised in circus exhibitions, as described
by Virgil (Aen. v. 286 seq.).

In the middle ages the best runners were oftentimes found
among the couriers maintained by potentiates and munici-
palities, those of Tartary, England, Scotland, Italy and the
Basque country having enjoyed the greatest reputation, while
the Pechis, or Persian couriers of the Turkish sultans, often
ran from Constantinople to Adrianople and back, a distance
of about 220 m., in two days and nights. Many couriers carried
silver beads in their mouths to obviate thirst. Couriers (syrki),
who run before the carriages of their masters are still in use
in the East. In the districts of India not traversed by railways,
dak runners are still employed to carry the mails from village
to village, many wearing belts about their necks to frighten
away the tigers. The runners of the American Indians were
famous, and extraordinary tales are told of their swiftness and
endurance.

In all parts of Great Britain, running at short distances, as
well as steepleschases and cross-country runs, has been popu-
lar for many centuries, each district and period having its
champions, some of whom achieved national reputation. Dur-
ning the Puritan rule and that of Charles II. athletic sports all
but died out in England, only to be revived with renewed vigour
in the early part of the 19th century, when the public schools
and universities began to pay more attention to them. A
significant event in the history of running was the institution
of the famous "Crack Run" (cross-country) at Rugby in 1837.
The establishment of the Cambridge University sports (1857),
the Oxford sports (1860), and the British championship meet-
ings of the Athletic Union (1873), were important steps in the
back of running. Records made thereafter received the stamp of authenticity,
those made in former years being doubtful on account of lack
measurements and timing. In the United States and Canada
authentic records date from the institution of the American
Championships in 1876. The National Association of Amateur
Athletes of America was formed in 1880.

Running at the present day is divided into sprinting (dis-
tances up to one-quarter of a mile), middle-distance running
(from one-quarter of a mile to 1000 yds.) and long-distance
running (over 1000 yds.).

Sprinting consists of running over short distances with a
full and continuous burst of speed, the chief distances being
100 yds., 220 yds. and quarter-mile. Distances up to and
including 220 yds. are in America called dashes. The course for
sprinting races, when run in the open air, is marked off in lanes
for the individual runners by means of cords stretched upon
short iron rods. Starting in sprints has now become very
expert. The old method of dropping a handkerchief was the
only possible way to give the starting signal, since the muscles
react most slowly to impressions of sight, less so to those of
touch, and most quickly to those of sound, a difference of 4½
of a second in reaction amounting to over one foot in a run of
100 yds. All modern foot-races are therefore started by the
pistol; the runners wait for the signal in a crouching attitude,
with the fingers of both hands resting on the ground on each
side of the body, from which position they spring upwards and
forwards at the sound of the pistol. The crouching start
was found to be much quicker in getting off the mark than the
upright attitude formerly adopted, and by 1892 had been
adopted by all first-class sprinters in America, and a year or
two later in Great Britain. Another advantage is that the
runner is steadier on the mark, and since its adoption the
prescribed penalty of being placed one yard behind the mark
for starting before the pistol-shot has been very seldom enforced,
and the risky experiment of "beating the pistol," i.e. letting
the body fall forward in the hope that the shot would come
before the feet had to be moved, has practically disappeared.
The improved time in running and the adoption of the crouch-
ing start have resulted in the continued reduction of sprinting
records. "Even time," or 10 secs., is still considered a fine
performance for the hundred yards, but has been repeatedly
beaten both in England and America. A. F. Duffey, who,
like C. A. Bradley and J. W. Morton, won the English champi-
donship in four successive years, shares with D. J. Kelly the
record, 9½ secs., for 100 yds.; and J. W. Morton, a Scot, as well
as J. H. Hempton and W. T. Macpherson of New Zealand, are
credited with 9¾ secs. The excellence of American runners
in the sprints is probably accounted for partly by tempering
influenced by climate; but the American practice of running
short races of from 50 to 75 yds. during the numerous indoor meetings held in winter-time offers excellent training in starting and getting into full stride. The best time for the eighth mile (220 yards), a distance often run in America, is 212 sec., made in 1896 on a straightaway track by B. J. Webers.

The quarter-mile (440 yards) is almost always run on a curved track, and hence a quick start is important, for should the runner who has the advantage of the inside position allow himself to be outrun in the distance to the first turn, one of his opponents is likely to cut in and deprive him of it, while on the other hand a runner on the outside must actually outrun the inside man in order to be on even terms after the turn. The element of strategy, unknown in straight sprints, thus enters into the quarter. Speed is, of course, the chief requisite for a quarter-miler, but a certain amount of staying power is also necessary. The standard time for the quarter is 50 sec., which means an average speed of 11.23 sec. for each 220 yds. round the course. That of M. W. Long of Columbia University, who made the record, 47 sec., in 1900, was on that occasion 10.68 sec. for each hundred yards.

The system of "relay races," usually run by four men each going a quarter of the distance, is a popular variety. The favourite distance is a mile, each man running a quarter at top speed. This method of racing was introduced in the United States about the year 1890 on the model of the Massachusetts firemen's "bean-pot" races, and has since become very popular there. The old method was for the men running the second quarter of the course to wait on the mark for the first relay men to arrive, and then, snatching small flags from their hands, to continue the race, handing over the flags to the third relay upon completing their quarter. The flags, being cumbersome, were afterwards abandoned, and the new runners are more referred to the preceding contestants. The record, 3 min, 212 sec., was made in 1898 by B. J. Webers, M. W. Long, T. E. Burke and H. S. Lyons of the New York Athletic Club.

Middle-Distance Running.—The chief middle distances are 600 yds., 660 yds., 880 yds. (half-mile) and 1000 yds., but of these the half-mile is the only one commonly recognized in championship sports. Endurance is more important at these distances, though speed is essential, and the element of strategy increases. An element unknown to sprinting enters into middle- and long-distance runs, namely that of pace-making; even when the real race is between two individuals at least one other runner on each side takes part in the contest, in order to "make the pace" for his principal. Emil Longhi (U.S.A.) holds the half-mile world's record of 1 min. 524 sec., made in 1909. J. F. K. Cross of Oxford University ran the half-mile at Oxford in 1888 in 1 min. 54 sec. The record for 1000 yds., 2 min. 13 sec., was made in 1903 by E. L. Myers (U.S.A.). The distance of three-quarters of a mile is seldom run now at large meetings.

Long-Distance Running.—This includes all flat races of 1 m. or more, as well as steeplechasing, hare-and-hounds, and other forms of cross-country running. Great Britain has always been the home of long-distance running, different forms of cross-country racing having been popular all over the kingdom for centuries. In England at the championship meeting the distance events on the flat are the 1 m., 4 m. and 10 m. races, and in the inter-university sports the 1 m. and 3 m.; in America the distances are 1 m., 2 m. and 5 m.; but any and all of these distances are often included in important British and American programmes. Hard daily training is necessary for a distance runner. Good pace-making and strategy in general are of great importance. The runner must learn to "run to the watch," i.e. to cover the different portions of the distance in a certain time in order to be placed most advantageously for the finish. The mile race requires speed as well as stamina. Most champion milers are capable of doing the half under 2 min. The record for the mile, made in 1886 at Lillie Bridge by W. G. George, as a professional, is 4 min. 12 sec.; the amateur record is 4 min.

In addition to the records for the above-mentioned distances, Shrub held in 1908 the records for 6, 7, 8, 9 and 11 m., and also for the greatest distance covered in 1 h., namely, 11 m. 1516 yds. He won the 4 m. and the 10 m. British championship 1901-4 inclusive, and the 1 m. championship 1903 and 1904; and also the French 1 m. and 10 m. championships 1904-5 inclusive. Shrub was moreover a first-rate cross-country runner also; he won the British 10 m. cross-country championship 1901-4 inclusive, and the international 8 m. cross-country championship 1902-4. In 1863 a full-blooded Seneca Indian, L. Bennet, known as "Deerfoot," ran 12 m. in 1 h. 2 m. 21 sec.

Real cross-country running is a fast jog up hill and dale. It may take the form of a race from the gymnasiaum or club-house across the fields to a given spot and back again, passing certain objects or buildings; or of a practice run behind the coach preparatory to a long-distance race on the track; or of a paper-chase, or hare-and-hounds, the "hares," two or three in number, starting a few minutes before the "hounds," and leaving a trail of scraps of paper dropped from bags, which must be followed by the "hounds." In Great Britain the standard distance is 10 m., but in America it is somewhat less, the distance for the intercollegiate championship race being 6.5 m.

Steeplechasing was originally only a cross-country run over a course plentifully provided with natural obstacles, such as brooks, ditches, fences and hedges; but at the present day the steeplechase takes place in the inner enclosure of an athletic field and the obstacles are artificial. They are placed about 70 or 80 yds. apart, and consist of hurdles, a stone wall about 3 ft. high and 2 or 3 ft. broad, and a water-jump, a ditch about 6 ft. broad filled with water and guarded by a wall or fence covered with thick furze or other thick shrubbery. Steeple-chase courses differ widely, but the usual distance both in Great Britain and America is 2 m. The time necessary to cover this distance varies according to the difficulties of the course, but a few seconds under 11 m. is considered very fast time.

Team-racing is a favourite form of distance running, each team consisting of 10 men and the distance usually 4 m., the standard of the modern Olympic Games. Different systems of scoring are used, but the common system is as follows: the first team to arrive nine, and so on, the ninth arrival scoring one. The team aggregating the highest number of points wins.

Among modern distance events the Marathon Run of about 40 km. (24.4 m. 1900 yds.) is the most important. It was introduced in the first revived Olympic Games at Athens in 1896 (see Athletic Sports) in memory of the famous Greek runner who was said to have brought the news of the battle of Marathon in Athens, dropping dead when his task was finished.

RUODLIEB, a romance in Latin verse by an unknown German poet who flourished about 1090; he was almost certainly a Benedictine monk, and in any case a Baio. He was one of the earliest German romances of knightly adventure, and its vivid picture of feudal manners gives it a certain value as an historical document. The poet was probably an eye-witness of the episode (I. 4231-5321) which represents the meeting of the emperor Henry II. with Robert of France on the banks
of the Maas in 1623. Ruodlieb left unfinished, and furthermore the MS. was cut up and used for binding books, so that the fragments were only gradually discovered (from 1867 onwards) and pieced together. The framework of the story is borrowed from a popular märchen of the youth who takes service away from home, and is paid in wise saws instead of current coin. He receives at the same time a loaf, with instructions not to cut it until he is once more at home. This contains the coins. The proverbs, usually three in number, were increased in Ruodlieb to twelve, each of which was the starting-point of an episode by which the hero was made to appreciate its value.

RUPAR, a town of British India, in Umballa district of the Punjab, on the left bank of the river Sutlej, 43 m. N. of Umballa, 1120 ft. above sea-level. Pop. (1901) 8888. It was the scene of Ranjit Singh's visit to Lord William Bentinck when governor-general in 1831. Here are the head works of the Sirhind canal. Rupar has manufactures of cotton twill and hardware. Hindu and Mahomedan fairs are held. Rupee (Hindustani rupiya, from Sanskrit rupiya), the standard coin of the monetary system in India. A silver coin of 175 grains Troy, called tanka, approximating to the rupee, was struck by the Mahomedan rulers of Delhi in the 13th century; but the rupee itself, of 179 grains, was introduced by Sher Shah in 1542. The English at first followed various indigenous standards; but since 1835 the rupee has uniformly weighed 180 grains, containing 165 grains of pure silver. The weight of the rupee (one tola) is also the unit upon which the Indian standard of weights is based. Down to about 1873 the gold value of the rupee was 2s., and ten rupees were thus equal to £1; but after 1873, owing to the depreciation of silver, the rupee at one time sank as low as 1s. 4d. Therefore a lakh of rupees, which before 1873 was worth £10,000, is now only worth £6666, and a crore of rupees, which was formerly a million sterling, now only amounts to £666,666. The rupee is divided into sixteen annas, now worth 2d. each, and the anna is subdivided into 92 pice. (See India, and Money.)

RUPERT (HISODERZO), ST., according to the *Gesta Sancti Hodoberti*, which dates from the 9th century, was a bishop of the Merovingian house, and bishop of Worms under Childebert III. (605-711). At the invitation of the duke of Bavaria, Theodo II., Rupert went to Regensburg (Ratisbon), where he began his apostolate. He founded the church of St Peter near the Wallersee, and subsequently, at Salzburg, the church of St Peter, together with a monastery and a dwelling for the clerks, as well as a convent for women "in superiori castro Iuvavensium." He died and was buried at Salzburg. He is regarded as the apostle of the Bavarians, not that the land was up to that time altogether heathen, but because of his services in the promotion and consolidation of its Christianity.

See Bibliotheca hagiographica Latina (Brussels, 1890), n. 7300-7403; W. Levison, "Die älteste Lebensbeschreibung Rupert von Salzburg in Neues für die ältere deutsche Geschichtskunde, xxviii. 283 seq.; Hauck, Kirchengeschichte Deutschland (3rd ed.). i. 372 seq.

RUPERT, PRINCE, COUNT PALATINE OF THE RHEIN AND DUKE OF BAVARIA (1610-1682), third son of the elector palatine and "winter king" of Bohemia, Frederick V., and of Elizabeth, daughter of James I. of England, was born at Prague on the 17th of December 1619. A year later his father was defeated at the battle of the Weisser-Berg, near Prague, and driven from Bohemia. After many wanderings the family took refuge in Holland, where Rupert's boyhood was spent. In 1633 the boy was present at the siege of Rheinberg in the suite of the Prince of Orange, and in 1635 he served in this prince's bodyguard. In 1636 he paid his first visit to England, was entered as an undergraduate, though only nominally, at St John's College, Oxford, and was named as the governor of a proposed English colony in Madagascar. But this scheme did not mature, and Charles sent his nephew back to Holland, having, however, formed a high opinion of his energy, talent and resolution. In 1637 he was again serving in the wars, and in 1638, after displaying conspicuous bravery, he was taken prisoner by the imperialists at the action of Vlotho (17th October) and held in a not very strict captivity for three years. In 1641 he was released, and, rejoining his mother in Holland, was summoned to England to the assistance of his uncle, for the Great Rebellion was about to break out.

In July 1642 he landed at Tynemouth. Charles at once made him general of the horse and independent of Lord Lindsey, the nominal commander of the whole army. From this point until the close of the first Civil War in 1646 Prince Rupert was the dominant figure of the war. His battles and campaigns are described in the article GREAT REBELLION. He was distinctively a cavalry leader, and it was not until the battle of Marston Moor in 1644 that the Royalist cavalry was beaten. The prince's strategy was bold as well as skilful, as was shown both in the Royalist movements of 1644 which he proposed, and in the two far-ranging expeditions which he carried out for the relief of Newark and of York. In November 1644, in spite of the defeat at Marston Moor, he was appointed general of the king's army. But this appointment, though welcome to the army, was obnoxious to the king's counsellors, who resented the prince's independence of their control, to some of the nobility over whose titles to consideration he had ridden roughshod, and to some of the officers whose discipline and rapacity were likely to be repressed with a heavy hand. These dissensions culminated, after the prince's surrender of Bristol to Fairfax, in a complete breach with Charles, who dismissed him from all his offices and bade Rupert and his younger brother Maurice seek their fortunes beyond the seas.

Rupert's character had been tempered by these years of responsible command. By 1645, although the parliamentary party accused him not merely of barbarity but of ingratitude for the kindnesses which his family had received from English people in the days of the Palatinate War, Rupert had in fact become a good Englishman. He was convinced, after Marston Moor, that the king's cause was lost, in a military sense, and moreover that the king's cause was bad. When he surrendered Bristol without fighting to the uttermost, it was because Fairfax placed the political issue in the foreground, and after the capitulation the prince rode to Oxford with his enemies, frankly discussing the prospect of peace. Already he had deliberately advised Charles to make peace, and had come to be suspected, in consequence, by Charles's optimistic adviser Digby. But to Charles himself the news of the fall of Bristol was a thunderbolt. "It is the greatest trial to my constancy that has yet befallen me," he wrote to the prince, "that one that is so near to me in blood and friendship submits himself to so mean an action." Rupert was deeply wounded by the implied stain on his honour; he forced his way to the king and demanded a court-martial. The verdict of this court smoothed over matters for a time, but Rupert was now too far estranged from the prevailing party at court to be of any assistance, and after further misfortunes and quarrels they separated, Charles to take refuge in the camp of the Scots, Rupert to stay, as a spectator without command, with the Oxford garrison. He received at the capitulation a pass from the parliament to leave England, as did also his faithful comrade Maurice.

For some time after this Rupert commanded the troops
formed of English exiles in the French army, and received a
wound at the siege of La Bassée in 1647. Charles in misfortune
had understood something of his nephew's devotion, and wrote
to him in the friendliest terms, and though the prince had by
no means forgiven Digby, Colepeper and others of the council,
he obtained command of a Royalist fleet. The king's enemies
were now no longer the Presbyterians and the majority of
the English people but the stern Independent community, with
whose aims and aspirations he could not have any sympathy
whatsoever. A long and unprofitable naval campaign followed,
which extended from Kinsale to Lisbon and from Toulon to
Cape Verde. But the prince again quarrelled with the council,
and spent six years (1654–60) in Germany, during which
period nothing is known of him, except that he vainly attempted
(as also before and afterwards) to obtain the apanage to which
as a younger son he was entitled from his brother the elector
palatine. At the Restoration he settled in England again,
receiving from Charles II. an annuity and becoming a member
of the privy council. He never again fought on land; but,
turning admiral like Blake and Monk, he bore a brilliant part
in the Dutch Wars. He died at his house in Spring Gardens,
Westminster, on the 29th of November 1682.

Apart from his military renown, Prince Rupert is a distin-
guished figure in the history of art as one of the earliest
mezzotinters. It has often been said that he was the inventor
of mezzotint engraving, but this is erroneous, as he obtained
the secret from a German officer, Ludwig von Siegen. One
of the most beautiful and valuable of early mezzotints is his "Head
of St John the Baptist." He was also interested in science,
experimented with the manufacture of gunpowder, the boring of
guns and the casting of shot, and invented a modified brass
called "prince's metal."

Prince Rupert was duke of Cumberland and earl of Holdern-
ness in the English peerage. He was unmarried, but left two
natural children: one a daughter who married General Emmanuel
Scrope Howe and died in 1745, and the other a son, whose
mother (who claimed that she was married to the prince) was
Frances, daughter of Sir Henry Bard, Viscount Bellamont.
The son was killed in 1686 at the siege of Buda.

See E. Warburton's Life of Pr. Rupert (London, 1849) and addi-
tional authorities quoted in the memoir by C. H. Firth in the Dict.
Nat. Biog.

RUPERT (1352–1410), German king, and, as Rupert III.,
elector palatine of the Rhine, was a son of the elector
Rupert II. and Beatrice, daughter of Peter II., king of Sicily. He
was born at Amberg on the 5th of May 1352, and from his early
years took part in the government of the Palatinate to which
he succeeded on his father's death in 1398. He was one of the
electors who met at Oberlahnstein in August 1400 and
declared King Wenceslaus deposed. This was followed by the
election of Rupert as German king at Renze on the 21st of that
month, and by his coronation at Cologne on the 6th of the
following January. Winning some recognition in S. Germany,
he made an expedition to Italy, where he hoped to receive the
imperial crown, and to crush Gian Galeazzo Visconti, duke of
Milan. In the autumn of 1401 he crossed the Alps, but his
troops, checked before Brescia, melted away, and in 1402
Rupert, too poor to continue the campaign, returned to Ger-
many. The news of this failure increased the disorder in
Germany, but the king met with some success in his efforts to
restore peace, and in October 1403 he was recognized by Pope
Boniface IX. It was only the indolence of Wenceslaus that
prevented his overthrow, and in 1406 he was compelled to make
certain concessions. The quarrel was complicated by the papal
schism, but the king was just beginning to make some headway
when he died at his castle of Landskron near Oppenheim on the
18th of May 1410 and was buried at Heidelberg. He married
Elizabeth, daughter of Frederick IV. of Hohenzollern, burgrave
of Nuremberg, and left three sons and four daughters. Rupert,
who earned the surname of elementes, was brave and generous,
but his resources were totally inadequate to bear the strain of
the German kingship.
RUSH, B.—RUSHWORTH

857

to Grosseto. The ruins are now thickly overgrown with
brushwood; but the walls, nearly 2 m. in circumference, are
in places well preserved. They consist of large unworked
blocks of a travertine which naturally splits into roughly rect-
gular blocks; these are quite irregular, and often as much
as 0 ft. long by 4 ft. wide; in the interstices smaller pieces are
inserted. The walls are embanking walls, with a low breastwork
in places. Within the circuit which they enclose, now under
cultivation, are two summits, one occupied by a Roman amphithe-
ater [the other by a tower (?) of uncertain date]; a Roman
cistern also is visible. Some 2 m. S.S.W. are modern baths,
fed by hot springs, which were in use in Roman times also, as
the discovery of remains of Roman buildings shows.

See G. Dennis, Cities and Cemeteries of Etruria (London, 1883).

RUSH, BENJAMIN (1745-1813), American physician, was
born in Byberry township, near Philadelphia, on a homestead
founded by his grandfather, a Quaker gunsmith, who had followed
Penn from England in 1683. In 1760 he graduated at Princeton.
After serving an apprenticeship of six years with a doctor in
Philadelphia, he went for two years to Edinburgh, where he
attached himself chiefly to William Cullen. He took his medical
degree there in 1767, spent a year in the hospitals of London,
and began practice in Philadelphia at the age of twenty-four, undertaking at the same time the chemistry
class at the Philadelphia medical college. He was a friend of
Franklin, a member of Congress for the state of Pennsylvania in
1776, and one of those who signed the Declaration of Indepen-
dence the same year. He had already written on the Test Laws,
"Sermons to the Rich," and on negro slavery; and in 1774 he
started along with James Pemberton the first anti-slavery
society in America, and was its secretary for many years.
In 1787 he was a member of the Pennsylvania convention
which adopted the Federal constitution, and thereafter he
retired from public life, and gave himself wholly to medical
practice. In 1790 he exchanged his chemistry lecture-
ship for that of the theory and practice of physic; and when
the medical college, which he had helped to found, was absorbed
by the university of Pennsylvania in 1791 he became professor of
the institutes of medicine and of clinical practice, succeeding
in 1816 Henry Drinker, his first pupil.

He gained great credit when the yellow fever devastated Phila-
delphia, in 1793, by his assiduity in visiting the sick, and by his
bold and apparently successful treatment of the disease by
bloodletting. He died in Philadelphia on the 19th of April
1813, after a five days' illness from typhus fever. His son
Richard is separately noticed. Another son, James (1786-1860),
was a physician, and author of various books, such as Philosophy
of the Human Voice (1827) and Analysis of the Human Intellect
(1863).

Benjamin Rush's writings covered an immense range of sub-
jects, including language, the study of Latin and Greek, the moral faculty,
capital punishment, medicine among the American Indians, maple
sugar, the blackness of the negro, the cause of syphilis, drinking
spirit, drinking, as well as many more strictly professional
topics. His last work was an elaborate treatise on the Diseases of the
Mind (1812). He is best known by the five volumes of Medical
Treatises and Observations, which he brought out at intervals from
1789 to 1798 (two later editions revised by the author).

See eulogy by his friend Dr David Hosack (Essays, i., New York,
1824), with biographical details taken from a letter of Rush to
President John Adams; also references in the works of T. M.
Gross and Bowditch on the history of medicine in America. His part
in the yellow fever controversies is indicated by La Roche (Yellow
Fever in Philadelphia from 1793 to 1854, 2 vols., Philadelphia, 1855)
and Burrows (Rush and the Fever, London, 1811). His services as an abolitionist pioneer are recorded in Clarkson's History
of the Abolition of the African Slave Trade.

RUSH, RICHARD (1780-1859), American statesman and
diplomatist, son of Dr Benjamin Rush, was born in Philadelphia,
Pennsylvania, on the 20th of August 1780. He graduated at
Princeton in 1797, and was admitted to the bar in 1800. He
was attorney-general of Pennsylvania in 1811, comptroller of
the treasury of the United States in 1811-14, attorney-
general in the cabinet of President James Madison in 1814-17,
acting secretary of state from March to September 1817, minister
to Great Britain in 1817-25, secretary of the treasury in the
credit of President J. Q. Adams in 1825-26, and candidate for
vice-president on the Adams ticket in 1828. In 1818, while
minister to Great Britain, he, in association with Albert Gallatin,
concluded with British plenipotentiaries the important treaty
which determined the boundary line between the United States
and Canada from the Lake of the Woods to the Rocky Moun-
tains and provided for the joint occupation of Oregon for ten
years. He also conducted the negotiations with Canning in
1823 relating to the S. American policy of the Holy Alliance.
He followed the Adams-Clay faction of the Democratic-
Republican party in the split of 1825-28, but returned to the
Democratic party about 1834 on the bank issue. In 1835
he and Benjamin C. Howard, of Baltimore, Maryland, were
sent by President Jackson to prevent an outbreak of hostilities
in the Ohio-Michigan boundary dispute. In 1836-38 Rush was
commissioner to receive the Smithsonian legacy (see SMITHSONIAN
INSTITUTION), and in 1847-49 he was minister to France.
He died at Philadelphia on the 30th of July 1839.

He published A Narrative of a Residence at the Court of London
from May, 1812, to March, 1815 (2 vols., London, 1816), and after the first
edition of the 1st volume are entitled Memoranda of a Residence,
&c.; Washington in Domestic Life (1857), compiled from letters
written by Washington to his private secretary in 1790-98; and
Obituary of President Rush (Philadelphia, 1880); and the
Miscellaneous (1880), and while attorney-general he suggested the plan for the
compilation, Laws of the Nation (5 vols., 1815), edited by John B.
Colvin.

RUSH. Under the name of rush or rushes, the stalks
or hollow stem-like leaves of several plants have minor industrial
applications. The common rushes (species of Juncus; see JUNCACEAE)
are used in many parts of the world for chair-
bottoms, mats and basket-work, and the pith serves as wicks
in open oil-lamps and for tallow candles—whence rushlight.
The fibrous stems and leaves of the bulrush or reed-mace,
Typha angustifolia, are used in N. India for ropes, mats
and baskets. Scirpus and other Cyperaceae are used for chair-
bottoms, mats and thatch; the rush mats of Madras are made
from a species of Cyperus. The sweet-rush, yielding essential
oil, is a grass, Andropogon Schenckii, known also as lemon
grass. Large quantities of the "horse-tail," Equisetum hie-
male, are used under the name of Dutch or scouring rush for scouring metal
and other hard surfaces on account of the large
proportion of silica the plant contains. Flowering rush is
Butomus umbellatus (see ALISMACEAE); wood-rush is the
common name for Lysula (see JUNCACEAE). Acorus Calamus,
sweet-flag, is also known as sweet-rush.

RUSHDEN, an urban district in the E. parliamentary division
of Northamptonshire, England, 66 m. N.N.W. from London
by the Midland railway. Pop. (1901) 24,453. The church of St Mary is a fine cruciform
building with western tower and spire. It is mainly decorated, with perpendicular addi-
tions, but retains some Early English details. The growth of Rushden as a town is modern. The industrial population is
employed in boot and shoe making, the local staple.

RUSHWORTH, JOHN (c. 1612-1690), the compiler of the
Historical Collections commonly described by his name, was
the son of Lawrence Rushworth of Acklington Park, Wark-
worth, Northumberland. When he was the degree of
M.A. at Oxford in 1649, he was said to belong to Queen's
College, but there are no traces of his presence at the university.
He was bred to the law, and in 1658 was appointed solicitor
to the town of Berwick. He was enrolled in Lincoln's Inn in
1641, and was called to the bar in 1647. He made a point of
attending on all public occasions of a political and judicial
character, such as proceedings before the Star Chamber or the
Council, and of making shorthand notes of them. On the 25th
of April 1649 he was appointed an assistant clerk to the House
of Commons. He was on duty when King Charles I. came
down to arrest the five members on the 4th of January 1642,
and made notes of his speech. The king insisted on taking
the notes, and ordered them to be published. Rushworth
attended the trial of the earl of Strafford, and took shorthand notes of the proceedings. He was much employed as a messenger between the king and the parliament, and from the 11th of April 1644 till the 9th of March 1647 was licensor of pamphlets. When the new model army was formed he was appointed secretary to the parliamentary general, Sir Thomas Fairfax. He was present at the battle of Naseby, of which he wrote an account. When Fairfax, who was offended by the execution of the king, resigned his command, Rusworth was for a short time secretary to Cromwell. He was afterwards employed by the council of state and during the protectorate, and sat in Cromwell's parliament for Berwick. When Richard Cromwell resigned the protectorate, Rusworth was employed by the Rump after it had been re-established by Monk. He made his peace with the government of Charles II., and though he was threatened with trial as a recidive he was not seriously molested. During the reign of Charles II. he continued to act as agent for the town of Berwick, and he sat for it in parliament. He was also for a time agent for Massachusetts, but the colony complained that it received no advantage from his services. During the last years of his life he fell into poverty, and from 1684 till his death on the 12th of May 1690 he was a resident in the King's Bench prison. At this time he had destroyed his memory by over-indulgence in drink. The collection of papers which he made was published in eight volumes folio between 1690 and 1701. The volumes from the fourth onwards appeared after his death. The first, which appeared with a dedication to Richard Cromwell, was recalled and the dedication was suppressed.

RUSKIN, JOHN (1819-1900), English writer and critic, was born in London, at Hunter Street, Brunswick Square, on the 8th of February 1819, being the only child of John James Ruskin and Margaret Cox. They were Scots, first cousins, the grandchildren of a certain John Ruskin of Edinburgh (1732-1780). In Præterita the author professes small knowledge of his ancestry. But the game of tracing the history of the family trace their descent to the Adairs and Agnew of Galloway. In this family tree are men famous in arms and in the public service: Sir Andrew Agnew of Lochnaw, Admiral Sir John Ross, Field-Marshal Sir Hew Dalrymple Ross, Dr John Adair, in whose arms Wolfe died at Quebec, and the Rev. W. Tweddle of Glenluce, to whom the original Covenant, now in the Glasgow Museum, had been confided. The name Ruskin is said to be a variant of Erskine, or Rosken, or Rogerkin, and even Roughskin. It is more probably Rusking, an Anglian family, which passed northwards and became Rusksyn, Rusken and Ruskin.

John Ruskin, the author's grandfather, a handsome lad of twenty, ran away with Catherine Tweddle, daughter of the Covenanting minister and of Catherine Adair, then a beautiful girl of sixteen. He settled in Edinburgh and engaged in the wine trade, lived liberally in the cultivated society of the city, lost his health and his fortune, and ended his days in debt. His son, John James Ruskin (1785-1864), father of the author, was sent to the High School at Edinburgh under Dr A. Adam, received a sound classical education, and was well advised by his friend Dr Thomas Brown, the eminent metaphysician. When of age, John James was sent to London to enter the wine trade. There, in 1809, he founded the sherry business of Ruskin, Telford & Domecq; Domecq being proprietor of a famous vineyard in Spain, Telford contributing the capital of the firm, and Ruskin having sole control of the business. John James Ruskin, a typical Scot, of remarkable energy, probity and foresight, built up a great business, paid off his father's debts, formed near London a most hospitable and cultured home, where he maintained his taste for literature and art, and lived and died, as his son proudly wrote upon his tomb, "an entirely honest merchant." He was also a man of strong brain, generous nature and fine taste. After a delay of nine years, having at last obtained an adequate income, he married his cousin, Margaret Cox, who had already lived for eighteen years with his mother, the widow of John Ruskin of Edinburgh. When this marriage of the two cousins, who had known each other all their lives, took place in 1818, neither of them was young. John James was then thirty-three and Margaret was thirty-seven. In the following year (8th February 1819) their only child, John, was born in Hunter Street, London.

Margaret Ruskin, the author's mother, was a handsome, strong, stern, able, devoted woman of the old Puritan school, Calvinist in religion, unsparing of herself and others, rigid in her ideas of duty, proud, reserved and ungracious. She was the daughter of Captain Cox, of Yarmouth, master mariner in the herring fishery, who died young; whereupon her widow maintained herself as landlady of the King's Head Inn at Croydon. Her younger daughter married Mr Richardson, a baker, of Croydon; the elder, Margaret, married John James Ruskin. Jessie, a sister of John James, married Peter Richardson, a tenant, of Perth, so that the author had cousins of two Richardson families, unconnected with each other. In his own memoirs he speaks much more of these than of any Ruskins, Tweddales, Adairs or Agnews. The child was brought up under a rigid system of nursing, physical, moral and intellectual; kept without toys, not seldom whipped, watched day and night, but trained from infancy in music, drawing, reading aloud and observation of natural objects. When he was four the family removed to a house on Herne Hill, then a country village, with a garden and rural surroundings. The father, who made long tours on business, took his wife, child and nurse year after year across England as far as Cumberland and Scotland, visiting towns, cathedrals, castles, colleges, parks, mountains and lakes. At five the child was taken to Keswick; at six to Paris, Brussels and Waterloo; at seven to Perthshire. At fourteen he was taken through Flanders, along the Rhine, and through the Black Forest to Switzerland, where he first imbibed his dominant passion for the Alps. His youth was largely passed in systematic travelling in search of what he calls, "true beauty in art. And to one so precocious, stimulated by a parent of much cultural and means and great ambition, this resulted in an almost unexampled aesthetic education. In childhood also he began a systematic practice of composition, both in prose and verse. His mother trained him in reading the Bible, of which he read through every chapter of every book year by year; and to this study he justly attributes his early command of language and his pure sense of style. His father read to him Shakespeare, Scott, Don Quixote, Pope and Byron, and most of the great English classics; and his attention was especially turned to the formation of sentences and to the rhythm of prose. He began to compose both in prose and verse as soon as he had learned to read and write, both of which arts he taught himself by the eye.

His first letter is dated 1823, when he was only four. In it he corrects his aunt, who had put up the wooden pillars of his Waterloo bridge "upside down." At five he caught bookworm. At seven he began a work in four volumes, with "cooper-plates printed and composed by a little boy, and also drawn." His first poem, correct in rhyme and form, was written before he was seven. At nine he began "Eudoxia, a poem of the Universe." From that year until his Newdigate Prize, at the age of twenty, he wrote enormous quantities of verse, and began dramas, romances and imitations of Byron, Pope, Scott and Shelley. What remain of these effusions have no special quality except good sense, refined feeling, accuracy of phrase, and a curious correctness of accent and rhythm. Of true poetry in the higher sense there is hardly a single line.

His schooling was irregular and not successful. At the age of eleven he was taught Latin and Greek by Dr Andrews, a scholar of Glasgow University. About the same time he had his lessons in drawing and in oil painting from Runciman. French and Euclid were taught by Rowbotham. At fifteen he was sent for two years to the day-school of the Rev. T. Dale of Peckham, and at seventeen he attended some courses in
RUSKIN 859

literature at King's College, London. In painting he had lessons from Copley Fielding and afterwards from J. D. Harding. But in the incessant travelling, drawing, collecting specimens and composition in prose and verse he had gained but a very moderate classical and mathematical knowledge when he matriculated at Oxford; nor could he ever learn to write tolerable Latin. As a boy he was active, lively and docile; a good walker, but ignorant of all boyish games, as naff and as innocent as a child; and he never could learn to dance or to ride. He was only saved by his intellect and his fine nature from turning out an arrant prig. He was regarded by his parents, and seems to have regarded himself, as a genius. As a child he had been "a savant in petticoats"; as a boy he was a poet in breeches. At the age of seventeen he saw Adèle, the French daughter of Monsieur Doreseuq, Mr Ruskin's partner, a lovely girl of fifteen. John fell rapturously in love with her; and, it seems, the two fathers seriously contemplated their marriage. The young poet wooed the girl with poems, romances, dramas and mute worship, but received nothing except chilling indifference and lively ridicule. To the gay young beauty, familiar with Parisian society, the raw and serious youth was not a possible parti. She was sent to an English school, and he occasionally saw her. His unspoken passion lasted about three years, when she married the Baron Duquesne. Writing as an old man, long after her death, Ruskin speaks of her early love without any sort of rapture. But it is clear that it deeply coloured his life, and led to the dangerous illness which for some two years interrupted his studies and made him a wanderer over Europe.

As the father was resolved that John should have everything that money and pains could give, and was one day to be a bishop at least, he entered him at Christ Church, Oxford, as a gentleman-commoner—then an order reserved for men of wealth and rank. Ruskin's Oxford career, broken by the two years passed abroad, was not very full of incident or of usefulness. Though he never became either a scholar or a mathematician, he did enough accurate work to be placed in the honorary fourth class both in classics and in mathematics. By the young bloods of the "House" he was treated pleasantly as a raw outsider of genius. By some of the students and tutors, by Liddell, Newton, Acland and others, he was regarded as a youth of rare promise, and he made some lifelong friendships with men of mark and of power. Both he and his college took kindly the amazing proceeding of his mother, who left her husband and her home to reside in Oxford, that she might watch over her son's health. The one success of his Oxford career was the prize essay, "The New World," and the poem "Elephant and Elephants," which he recited in the Sheldonian Theatre (June 1839). Two years of ill-health and absence from home ensued. And he did not become "a Graduate of Oxford" until 1842, in his twenty-fourth year, five years after his first entrance at the university. In fact, his desultory school and college life had been little more than an interruption and hindrance to his real education—the study of nature, of art and of literature. Long before Ruskin published books he had appeared in print. In March 1834, when he was but fifteen, Loudon's Magazine of Natural History published an essay of his on the strata of mountains and an inquiry as to the colour of the Rhine. He then wrote for Loudon's Magazine of Architecture, and verses of his were inserted in Messrs Smith & Elder's Friendship's Offering, by the editor, T. Pringle, who took the clad to see the poet. "At seventeen," wrote for Blackwood a defence of Turner, which the painter, to whom it was first submitted, did not take the trouble to forward to the magazine. At eighteen he wrote a series of papers, signed Kata Phusin, i.e. "after Nature," for Loudon's Magazine, on "The Poetry of Architecture." In 1838 (he was then nineteen) Mr Louden wrote to the father, "Your son is the greatest natural genius that ever it has been my fortune to become acquainted with."

Having recovered his health and spirits by care and foreign travel, and having taken his degree and left Oxford, Ruskin set to work steadily at Herne Hill on the more elaborate defence of Turner, which was to become his first work. Modern Painters, vol. i., by "a Graduate of Oxford," was published May 1843, when the author was little more than twenty-four. It produced a great and immediate sensation. It was vehemently attacked by the critics, and cooledly received by the painters. Even Turner was somewhat disconcerted; but the painter was now known to both Ruskins, and they freely bought his pictures. The family then went again to the Alps, that John might study mountain formation and "Truth" in landscape. In 1845 he was again abroad in Italy, working on his Modern Painters, the second volume of which appeared in 1846. He had now plunged into the study of Bellini and the Venetian school, Fra Angelico and the early Tuscans, and he visited Lucca, Pisa, Florence, Padua, Verona and Venice, passionately devoting himself to architecture, sculpture and painting in each city of north Italy. He wrote a few essays for the Quarterly Review and other periodicals, and in 1849 (ad 30) he published The Seven Lamps of Architecture, with his own etchings, which greatly increased the reputation acquired by his Modern Painters.

On the 10th of April 1848, a day famous in the history of Chartism, Ruskin was married at Perth to Euphemia Chalmers Gray, a lady of great beauty, of a family long intimate with the Ruskins. The marriage, we are told, was arranged by the parents of the pair, and was a somewhat hurried act. It was evidently ill-assorted, and brought no happiness to either. They travelled, lived in London, saw society, and attended a "Drawing-room" at Buckingham Palace. But Ruskin, immersed in various studies and projects, was no husband for a brilliant woman devoted to society. No particulars of their life have been made public. In 1854 his wife left him, obtained a nullification of the marriage under Scots law, and ultimately became the wife of John Everett Millais. John Ruskin returned to his parents, with whom he resided till their death; and neither his marriage nor the annuling of it seems to have affected seriously his literary career.

Ruskin's architectural studies, of which The Seven Lamps was the first fruit, turned him from Turner and Modern Painters. He planned a book about Venice in 1845, and The Stones of Venice was announced in 1846 as in preparation. After intense study in Italy and at home, early in 1851 (the year of the Great Exhibition in London) the first volume of The Stones of Venice appeared (ad 32). It was by no means a mere antiquarian and artistic study. It was a concrete expansion of the ideas of The Seven Lamps—that the buildings and art of a people are the expression of their religion, their morality, their national aspiration and social habits. It was, as Carlyle wrote to the author, "not a work of the time," "a new era," "a new Renaissance." It appeared in the same year with the Construction of Sheepfolds—a plea for the reunion of Christian churches—in the same year with the essay on Pre-Raphaelitism, the year of Turner's death (10th December). The Stones of Venice was illustrated with engravings by some of the most refined artists of his time. The author spent a world of pains in having these brought up to the highest perfection of the reproductive art, and began the system of exquisite illustration, and those facsimiles of his own and other sketches, which make his works rank so high in the catalogues and price-lists of collectors. This delicate art was carried even farther in the later volumes of Modern Painters by the school of engravers whom Ruskin inspired and gathered round him. And these now rare and coveted pieces remain to rebuke us for our modern preference for the mechanical and artificial chiaroscuro of photogravure—the successor and destroyer of the graver's art. Although Ruskin was practised in drawing from the time that he could hold a pencil, and had lessons in painting from some eminent artists, he at no time attempted to paint pictures. He said himself that he was unable to compose a picture, and he never sought to produce anything that he would call a work of original art. His drawings, of which he produced an enormous quantity, were always intended by himself to be studies or memoranda of buildings or natural objects precisely as they appeared to his eye. Clouds, mountains, landscapes, towers,
churches, trees, flowers and herbs were drawn with wonderful precision, minuteness of detail and delicacy of hand, solely to recall some specific aspect of nature or art, of which he wished to retain a record. In his gift for recording the most subtle characters of architectural carvings and details, Ruskin has hardly been surpassed by the most distinguished painters.

In 1853 The Stones of Venice was completed at Herne Hill, and in that year (34) he opened the long series of public lectures wherein he came forward as an oral teacher and preacher, not a little to the alarm of his parents and amongst a storm of controversy. The Edinburgh Lectures (November 1853) treated Architecture, Turner, and Pre-Raphaelitism. The Manchester Lectures (July 1857) treated the moral and social uses of art, now embodied in A Joy for Ever. Some other lectures were reprinted in On the Old Road and The Two Paths (1859). These lectures did not prevent the issue of various Notes on the Royal Academy pictures and the Turner collections, works on the Harbours of England (1856); on the Elements of Drawing (1857); the Elements of Perspective (1859); and at last, after protracted labour, the fifth and final volume, Modern Painters (1860). This marks an epoch in the career of John Ruskin; and the year 1860 closed the series of his works on art strictly so called; indeed, this was the last of his regular works in substantial form. The last forty years of his life were devoted to expanding his views, or rather his doctrines, on social and industrial problems, on education, morals and religion, wherein art becomes an incidental and instrumental means to a higher and more spiritual life. And his teaching was embodied in an enormous series of Lectures, Letters, Articles, Selections and serial pamphlets. These are now collected in upwards of thirty volumes in the final edition. The entire set of Ruskin's publications amounts to more than fifty works having distinctive titles. For some years before 1860 Ruskin had been deeply stirred by reflecting on the condition of all industrial work and the evils of modern society. His lectures on art had dealt bitterly with the mode in which buildings and other works were produced. In 1854 he joined Mr F. D. Maurice, Mr T. Hughes, and several of the new school of painters, in teaching classes at the Working Men's College. But it was not until 1860 that he definitely began to propound a new social scheme, denouncing the dogmas of political economy. Four lectures on this topic appeared in the Cornhill Magazine until the public disapproval led the editor, then W. M. Thackeray, to close the series. They were published in 1862 as Unto this Last. In the same year he wrote four papers in the same sense in Fraser's Magazine, then edited by J. A. Froude; but he in turn was compelled to suspend the issue. They were completed and ultimately issued under the title Munera Pulvaris. These two small books contain the earliest and most systematic of all Ruskin's efforts to depict a new social Utopia: they contain a vehement repudiation of the orthodox formulas of the economists; and they are for the most part written in a trenchant but simple style, in striking contrast to the florid and discursive form of his works on art.

In 1864 Ruskin's father died, at the age of 70, leaving his son a large fortune and a fine property at Denmark Hill. John still lived there with his mother, aged 85, infirm, and blind, in sight, to whom came as a companion their cousin, Joanna Ruskin Agnew, afterwards Mrs Arthur Severn. At the end of the year 1864 Ruskin delivered at Manchester a new series of lectures—not on art, but on reading, education, woman's work and social morals—the expansion of his earlier treatises on economic sophisms. This afterwards was included with a Dublin lecture of 1869 under the fantastic title of Sesame and Lilies (perhaps the most popular of his social essays), of which 44,000 copies were issued down to 1900. He made this, in 1871, the first volume of his collected lectures and essays, the more popular and didactic form of his new Utopia of human life. It contains, with Fors, the most complete sketch of his conception of the place of woman in modern society. In the very characteristic preface to the new edition of 1871 he proposes never to reprint his earlier works on art; disclaims many of the views they contained, and much in their literary form; and specially regrets the narrow Protestantism by which they were pervaded. In the year 1866 he published a little book about girls, and written for girls, a mixture of morals, theology, economics and geology, under the title of Ethics of the Dust; and this was followed by a more important and popular work, The Crown of Wild Olive. This in its ultimate form contained lectures on “Work,” “Traffic,” “War,” and the “Future of England.” It was one of his most trenchant utterances, full of fancy, wit, eloquence and elevated thought. But a more serious volume was Time and Tide (1867), a series of twenty-five letters to a workman of Sunderland, upon various points in the Ruskinian Utopia. This little collection of “Thoughts,” written with wonderful vivacity, ingenuity and fervour, is the best summary of the author's social and economic programme, and contains some of his wisest and finest thoughts in the purest and most masculine English that he had at his command. In 1869 he issued the Queen of the Air, lectures on Greek myths, a subject he now took up, with some aid from the late Sir C. Newton, was followed by some other passages reduced in the same manner to the Slade professor of art in the university of Oxford. He now entered on his professorial career, which continued with some intervals down to 1881, and occupied a large part of his energies. His lectures began in February 1870, and were so crowded that they had to be given in the Sheldonian Theatre, and frequently were repeated to a second audience. He was made honorary fellow of Corpus Christi, and occupied rooms in the college. In 1871 his mother died, at the age of 90, and his cousin, Miss Agnew, married Mr Arthur Severn. In that year he bought from Mr Linton, Brantwood, an old cottage and property on Coniston Lake, a lovely spot facing the mountain named the Old Man. He added greatly to the house and property, and lived in it continuously until his death in 1900. In 1871, one of the most eventful years of his life, he began Fors Clavigera, a small serial addressed to the working men of England, and published only by Mr George Allen, engraver, at Keston, in Kent, at 7a., and afterwards at 10d., but without discount, and not through the trade. This was a medley of social, moral and religious reflections interspersed with casual thoughts about persons, events and art. Fors means alternatively Fate, Force or Chance, bearing the Clavis, Club, Key or Nail, i.e. power, patience and law. It was a desultory position of the Ruskinian ideal of life, manners and society, full of wit, play, inventive and sermons on things in general. It was continued with intervals down to 1884, and contained ninety-six letters or pamphlets, partly illustrated, which originally filled eight volumes and are now reduced to four.

The early years of his Oxford professorship were occupied by severe labour, sundry travels, attacks of illness and another cruel disappointment in love. In spite of this, he lectured, founded a museum of art, to which he gave pictures and drawings and £5000; he sought to form at Oxford a school of drawing; he started a model shop for the sale of tea, and model lodgings in Marylebone for poor tenants. At Oxford he set his pupils to work on making roads to improve the country. He now assumed “St. George's Guild,” himself contributing £5000, the object of which was to form a model industrial and social movement, to buy lands, mills and factories, and to start a model industry on co-operative or Socialist lines. In connexion with this was a museum for the study of art and science at Sheffield. Ruskin himself endowed the museum with works of art and money; a full account of it has been given in Mr E. T. Cook's Studies in Ruskin (1880), which contains the particulars of his university lectures and of his economic and social experiments. It is unnecessary to follow out the history of these somewhat unpromising attempts. None of them came to much good, except the Sheffield museum, which is an established success, and is now transferred to the town. In Fors, which was continued month by month for seven years. Ruskin poured out his thoughts, proposals and rebukes on
society and persons with inexhaustible fancy, wit, eloquence and freedom, until he was attacked with a violent brain malady in the spring of 1875 (act. 50); and, although he recovered in a few months sufficiently to do some occasional work, he resigned his professorship early in 1876. The next three years he spent at Brantwood, mainly in retirement, and unhappy in finding nearly all his labours interrupted by his broken health. In 1880 he was able to travel in northern France, and began the *Bible of Amiens*, finished in 1885; and he issued occasional numbers of *Fors*, the last of which appeared at Christmas 1884. In 1882 he had another serious illness, with inflammation of the brain; but he recovered sufficiently to travel to his old haunts in France and Italy—his last visit. And in the following year he was re-elected professor at Oxford and resumed his lectures; but increasing brain excitement, and indignation at the establishment of a laboratory to which vivisection was admitted, led him to resign his Oxford career, and he retired in 1884 to Brantwood, which he never left. He now suffered from frequent attacks of brain irritation and exhaustion, and had many causes of sorrow and disappointment. His lectures were published at intervals from 1870 to 1885 in *Art, Life, Penetlecti, The Eagle's Nest*, *Lover's Melange*, *Ariadne Florentina*, *Val d'Arno, Prometheus, Desolation, The Feet of Rosalit, The Bible of Amiens, The Art of England and The Pleasures of England*, together with a series of pamphlets, letters, articles, notes, catalogues and circulars.

In the retirement of Brantwood he began his last work, *Procrasteria*, a dotalolo autobiography with personal anecdotes and reminiscences. He was again attacked with the same mental malady in 1885, which henceforth left him fit only for occasional letters and notes. In 1887 it was found that he had exhausted (spent, and given away) the whole of the fortune he had received from his father, amounting, it is said, to something like £200,000; and he was dependent on the vast and increasing sale of his works, which produced an average income of £500 a year, and at times on the sale of his pictures and realizable property. In 1872 a correspondent had demonstrated with him in vain as to taking "usury," i.e. interest on capital lent to others for use. In 1874 Ruskin himself had begun to doubt its lawfulness. In 1876 he fiercely assailed the practice of receiving interest or rent, and he henceforth lived on his capital, which he gave freely to friends, dependants, public societies, charitable and social objects. The course of his opinions and his practice is fully explained in successive letters in *Fors*. Until 1889 he continued to write chapters of *Procrasteria*, which was designed to record memories of his life down to the year 1875 (act. 56). It was, in fact, only completed in regular series down to 1885 (act. 30), with a separate chapter as to Mrs. Arthur Severn, and a fragment called *Dilecta*, containing letters and early recollections of friends, especially of Turner. These two books were published between 1885 and 1889; and except for occasional letters, notes and prefaces, they form the last writings of the author of *Modern Painters*. His literary career thus extends over fifteen years. But he has left nothing more graceful, naïve and pathetic than his early memories in *Procrasteria*, a book which must rank with the most famous "Confessions" in any literature. The last ten years of his life were spent in complete retirement, the cost of his living borne by the care of the Severn family. whom the estate was transferred, with occasional visits from friends, but with no sustained work beyond correspondence, the revision of his works, and a few letters and prefaces to the books of others. He wished to withdraw his early art writings from circulation, but the public demand made this practically impossible. And now the whole of his writings are under the control of Mr. George Allen, in several forms and prices, including a cheap series at 5s. per volume.

The close of his life was one of entire peace and honour. He was loaded with the degrees of the universities and membership of numerous societies and academies. "Ruskin Societies" were founded in many parts of the kingdom. His works were translated and read abroad, and had an enormous circulation in Great Britain and the United States. Many volumes about his career and opinions were issued in his lifetime both at home and abroad. His 80th. birthday, 8th February 1900, was celebrated by a burst of congratulations and addresses, both public and private. His strength failed gradually; his mind remained feeble but unclouded, and his spirit serene. An attack of influenza struck him down, and carried him off suddenly after only two days' illness, 20th January 1900. He was buried in Coniston churchyard by his own express wish, the family refusing the offer of a grave in Westminster Abbey.

Ruskin's literary life may be arranged in three divisions. From 1837 to 1860 (act. 15 to 41) he was occupied mainly with the arts. From 1860 to 1871 (act. 41 to 52) he was principally occupied with *Fors*. From 1871 to 1890 (act. 52 to 70) he was again drawn back largely to art by his lectures as professor, whilst prosecuting his social utopia by speech, pen, example and purse. But the essential break in his life was in 1860, which marks the close of his most honest and almost his first attempt to found a new social gospel. With regard to his views of art, he himself modified and revised them from time to time; and it is admitted that some of his judgments are founded on imperfect and unclouded knowledge, i.e. that in his early years he was not sufficiently equipped to express his opinions, and that his later work was not sufficiently influenced by the fact that his was founded, not upon the beauty of nature, but upon the beauty of the mechanical arts. But the negative part of Ruskin's teaching on economics, social and political problems, has been much more effective than the positive part of his teaching. It must be admitted that nearly the whole of his practical experience was either false or unreal. His life is not unnatural, seeing his defiance of the ordinary habits and standards of the world. A more serious defect was his practice of violently assailing philosophers, economists and men of science, of whom he had, in most nothing, and whom he represented as the subjects of some sort of persecution. But he has the respect of all men such as Adam Smith, Comte, Mill, Spencer, Darwin and all who followed them. In art, Ruskin had enjoyed an unexpected training, which made him a consummate expert. In philosophy and science, he was an amateur, seeking to found a new sociology and a utopian polity out of his own inner consciousness and study of nature, poetry and the Bible. It is not wonderful if, in doing this, he poured forth a quantity of crude conceits and some eccentricities, and became the subject of abuse and derision by the most Laputan of his theories, his pure and chivalrous nature, and the marvellous insight into the heart of things which was his genius. The true, real and noble in life, and in his own person, was his own play full of fascination and moral suggestion.

In mastery of prose language he has never been surpassed, when he chose to curb his florid imagination and his discursive eagerness of his headings on art, and the cry of his attention bore away the public from the first, in spite of their heretical dogmatism and their too frequent extravagance of rhetoric. But his later economic and social pieces, such as *Unto This Last*, *Time and Tide* and *Fors* is now very much in the air, and represents the aspirations of the most eminent reformers. But the negative part of Ruskin's teaching on economics, social and political problems, has been much more effective than the positive part of his teaching. lineage from “Hugh de Rozel,” alias “Hugh Bertrand, lord of le Rozel,” a companion of the Conqueror, padding their fiction with the pedigree of certain Russells who are found holding Kingston Russell in Dorset as early as the reign of King John. But the first undisputed ancestor of the Bedford line is Henry Russell, a Weymouth merchant, returned as a burgess for that borough in four parliaments between 1425 and 1442. He may well have been the son of Stephen Russell, another Weymouth merchant, whose name is just before his in the list of those men of substance in Dorsetshire who, in 1434, under the act of parliament, were to be sworn not to maintain breakers of the peace. Stephen Russell, having served the office of bailiff of Weymouth, was returned as burgess to the parliament of 1395, and one William Russell was returned for King’s Melcombe in 1340. Both Stephen and Henry were in the wine trade with Bordeaux, and in 1427 Henry Russell was deputy to the chief butler of England for the port of Melcombe. In 1442 a pardon under the privy seal significantly describes Henry Russell of Weymouth, merchant, as alias Henry Gascoign, gentleman, and it is therefore probable that the ducal house of Bedford springs from a family of Gascon wine-merchants settled in a part of Dorsetshire, a county remarkable for the number of such French settlers.

Henry Russell of Weymouth made a firm footing upon the land by his marriage with Elizabeth Herion, one of the two daughters and co-heirs of John Herion of Chaldon Herion, a Dorsetshire squire of old family, heir of the Winterbournes of Winterbourne Clenston and of the Cernes of Draycot Cerne. John Russell, eldest son of this match, born before 1432, and returned to parliament for Weymouth in 1450, had his seat at Berwick in Swyre, he and his son and heir, James Russell, being buried in the parish church of Swyre. Thus John Russell, son and heir of James, was born in a family of squire’s rank, whose younger branches went on for many generations as merchants and shipowners at Weymouth. A happy accident is said to have brought him to court. The archduke Philip, son of the emperor Maximilian, was driven by heavy weather into Weymouth, whence Sir Thomas Trenchard had him escorted to the king at Windsor. According to tradition, John Russell, Trenchard’s young kinsman, was lately home from his service in the Low Countries, and so he was with the archduke as he probably made in the mercantile interests of his family. As travelling companion, or as a spy upon the strange guests, young Russell was sent with the archduke, who is said to have commended him to King Henry. Certain it is that on the accession of Henry VIII. John Russell advanced rapidly, serving the crown as soldier and as diplomatic agent. He fought well at Thérouanne, saw the Field of Cloth of Gold and the French disaster at Pavia, lost an eye by an arrow at Morlaix. In 1523 he was knight-marshal of the king’s household. In 1526 he married a rich widow, Anne, daughter and co-heir of Sir Guy Sapcotes by the co-heir of Sir Guy Wolston, a match which brought to the Russells the Buckinghamshire estate of Chenes, in whose chapel many generations of them lie buried. His peerage as Lord Russell of Chenes dated from 1539, and in the same year he had the Garter. Having held many high offices—lord high admiral, lord president of Devon, Cornwall, Dorset and Somerset, and lord privy seal—he was named by Henry VIII. as one of his executors. At the crowning of Edward VI. he was lord high steward, and after his defeat on the western rebels was raised, in 1550, to the earldom of Bedford. Queen Mary, like her brother, made him lord privy seal, although he is said to have favoured that Reformation which enriched him. He died in London in 1555, leaving to his son a vast estate of church lands and lands forfeited by less successful navigators of the troubled sea of Tudor politics. In the west he had the abbey lands of Tavistock, which give a marquess’s title to his descendants. In Cambridgeshire he had the abbatial estate of Thorney, in Bedfordshire the Cistercian house of Woburn, now the chief seat of the Russells. In London he had Covent Garden with the “Long Acre.” Thus the future wealth of his house was secured by those “immoderate grants” which made a text for Edmund Burke’s furious attack upon a duke of Bedford.

He left an only son, Francis, second earl of Bedford, K.G. (c. 1527-1582), who, being concerned in Wyatt’s plot, escaped to the Continent and joined those exiles at Geneva whose religious sympathies he shared. He returned in 1557, and was employed by Queen Mary before her death. Under Queen Elizabeth he governed Berwick, and was lord-lieutenant of the northern counties. Three of his four sons died before him, the third, killed in a border fray, being father of Edward, third earl of Bedford, who died without issue in 1627. The fourth son, William, created Lord Russell of Thornhaugh in 1603, was a soldier who fought fiercely before Zutphen beside his friend Sir Philip Sidney, whom he succeeded as governor of Flushing, and was from 1594 to 1597 lord-deputy of Ireland. He died in 1613, leaving an only son, Francis, who in 1627 succeeded his cousin as fourth earl of Bedford. This earl built the square of Covent Garden, and headed the “undertakers” who began the scheme for draining the great fen level. He opposed the king in the House of Lords, but might have played a part as mediator between the sovereign and the popular party when the king’s authority was at its lowest. He was in a way the last of the old school; he could not but be troubled at the sudden death of the smallpox in 1641 on the day of the king’s assessment of the bill for Strafford’s attainder. William, the eldest surviving son, was created as fifth earl, Edward, the youngest son, being father of Edward Russell (1553-1727), admiral of the fleet, who, having held the chief command in the victory of La Hogue, was created in 1697 earl of Orford. The fifth earl of Bedford, after fighting for the parliament at Edgehill and for the king at Newbury, surrendered to Essex and occupied himself with completing the drainage of the Bedford Level. He carried St. Edward’s staff at the crowning of Charles II., but quitted political life after the execution of his son, Lord Russell, in 1683. In 1694 he was created duke of Bedford and marquess of Tavistock, titles to which his grandson, Wrothesley Russell, succeeded in 1700. The “patriot” Lord Russell had added to the family estates by his marriage with Rachel, daughter and co-heir of Thomas Wrothesley, the fourth earl of Southampton, from whom she finally inherited the earl’s property in Bloomsbury, with Southampton House, afterwards called Bedford House. Her son, the second earl of Bedford, married the daughter of a rich citizen, John Howland of Streatham, a match strangely commemorated by the barony of Howland of Streatham, created for the bridegroom’s grandfather, the first duke, in 1605. The third duke, another Wrothesley Russell (1708-1732), died without issue, his brother John (1710-1777) succeeding him. This fourth duke, opposing Sir Robert Walpole, became, by reason of his rank and territorial importance, a recognized leader of the Whigs. In the duke of Devonshire’s administration he was lord-lieutenant of Ireland, and he served as lord high constable at the coronation in 1760. His son Francis, styled marquess of Tavistock, was killed in 1769 by a fall in the hunting field, and Lord Tavistock’s son Francis (1765-1802) became the fifth duke. This was the peer whom Burke, smarting from a criticism of his own pension, assailed as “the Leviathan of the creatures of the crown,” enriched by grants that “outraged economy and even staggered credibility.” He pulled down Bedford House, built by Inigo Jones, Russell Square and Tavistock Square rising on the site of its being unmarried he was succeeded by his brother John, the sixth duke (1766-1830), whose third son was the statesman created in 1861, Earl Russell of Kingston Russell, better known as Lord John Russell. Lord Odo Russell, a nephew of “Lord John,” and ambassador at Berlin from 1871 to his death in 1884, was created Lord Amphill in 1881. Herbrand Arthur Russell (b. 1858), the eleventh duke and fifteenth earl, succeeded an elder brother in 1893. (O. B.A.)

**RUSSELL, ISRAEL COOK (1832-1895)**, American geologist, was born at Graftonville, New York, on the 10th of December 1832. He graduated at New York University in 1872, and later studied at the School of Mines, Columbia, where he was assistant professor of geology from 1875-77. He was assistant
Russell, J.—Russell, 1st Earl

Geologist on the United States Geographical and Geological Surveys in 1857, and in 1880 became attached to the Geological Survey of the United States. In 1882 he was appointed professor of geology in the university of Michigan.

His publications include: Sketch of the Geological History of Lake Lahontan (1885); The Newark System (Bulletin No. 85 U.S. Geol. Survey. 1892); Present and Extinct Lakes of Nevada (1896); Glaciers of North America (1897); Volcanoes of North America (1897); Glaciers of Mount Rainier (Ann. Rep. U.S. Geol. Survey, 1898); and North America (1900).

Russell, John (1745-1806), British portrait painter in pastel, was born at Guildford, Surrey. At an early age he entered the studio of Francis Cotes, R.A., from whom he derived his artistic education, and set up his own studio in 1767. Russell was a man of remarkable religious character, a devout follower of Whitefield. He began an elaborate introspective diary by Byrom's shorthand in 1766 and continued it to the time of his death. In it he records his own mental condition and religious exercises, entering with a certain morbid ingenuity into long disquisitions, and only occasionally recording information concerning his sitters. His religious life is the key to his complex character, as it actuated his whole career. He was elected a member of the Royal Academy in 1770 and exhibited from the beginning of the Academy down to 1825. He was the finest painter in crayons England ever produced, and although he painted in oil, in water-colours and in miniature, it was by his works in crayon that his reputation was made. He wrote the Elements of Painting in Crayon, and described it in his method. He made his own crayons, blending them on his pictures by a peculiar method termed "sweetening." This he carried out with his fingers, rubbing in the colours and softening them in outline, uniting colour to colour so accurately that they met into one another with a characteristic cadence. His pastel work is to oil painting "what the vaudeville is to the tragedy or the sonnet to the epic." His colours were pure and his blending so perfect that no change is to be seen in his works since they were executed. Sir Joseph Banks, writing in 1785 respecting his portraits of the president of Lady, Mrs. and Miss Banks, stated that "the oil pictures of the present time fade quicker than the persons they are intended to present, but the colours made use of by Russell will stand for ever," and in that prophecy is so far justified.

An important picture by him hangs in the Louvre ("Child with Cherries"), and two, including "The Old Bathing Man at Brighton," are owned by the crown. At the Royal Academy, of which he was a member, he exhibited three hundred and thirty works, and his portraits were engraved by Collyer, Turner, Heath, Dean, Bartolozzi, Trotter and other prominent engravers. Russell received warrants of appointment to the king, queen, prince of Wales and the duke of York. He was interested in astronomy, a friend of Sir W. Herschell, and no mean mathematician. He drew an exceedingly accurate map of the moon, and invented a piece of complicated mechanism for exhibiting its phenomena, publishing a pamphlet, illustrated by his own drawings, describing the apparatus.

Two of his sons inherited their father's talent, and one of them, William (1780-1870), exhibited five fine portraits in the Royal Academy.

See George C. Williamson, John Russell (London, 1894).

G. C. W.

Russell, John (d. 1494), English bishop and chancellor, was admitted to Winchester College in 1443, and in 1449 went to Oxford as fellow of New College. He resigned his fellowship in 1452, and appears to have entered the royal service. In April 1467 and January 1468 he was employed on missions to Charles the Bold at Bruges. He was there again in February 1471 as one of the envoys to invest Charles with the Garter: the letter of which Russell delivered on this last occasion was one of Caxton's earliest publications, probably printed for him at Bruges by Colard Mansion (see Blades, Life of Caxton, i. p. vii, ii. 29-31). In May 1474 he was promoted to be keeper of the privy seal, and retained his office even after his consecration as bishop of Rochester on the 2nd of September 1476, and translation to Lincoln on the 9th of September 1480. As a trusted minister of Edward IV., he was one of the executors of the king's will; but on the 13th of May 1483 he accepted the office of chancellor in the interest of Richard of Gloucester, apparently with great reluctance. He retained the great seal till the 29th of July 1485. Russell was above all things an official, and was sometimes employed by Henry VII. in public affairs. But his last years were occupied chiefly with the business of his diocese, and of the university of Oxford, of which he had been elected chancellor in 1483. He died at Nettleham on the 30th of December 1494, and was buried at Lincoln Cathedral.

Sir Thomas More calls Russell "a wise manne and a good, and of much experience, and one of the best-learned men, undoubtedly, that England had in his time." Two English speeches composed by Russell, for the intended parliament of Edward V., and the first parliament of Richard III., are printed in Nichols's Grants of Edward V. (Camden Soc.). Some other writings of less interest remain in manuscript.

For contemporary notices see especially More's Life of Richard III. The Continuation of the Croyland Chronicle, ap Freeman, Scripotorum, and Bentley's Excerpta Historica, pp. 16-17. See also Notes and Queries and Antiquities of the University of Oxford, and T. King, Winchester College, and Annals of Winchester College. There are modern biographies in Campbell's Lives of the Chancellors, and Foss's Judges of England. (C. L. K.)

Russell, John Russell, 1st Earl (1792-1878), British statesman, third son of the 6th duke of Bedford, by Georgiana Elizabeth Byng, second daughter of the 4th Viscount Torrington, was born in London on the 18th of August 1792. He was sent to a private school at Sunbury in 1800, and from 1803 to 1804 he was at Westminster School, but was then withdrawn on account of his delicate health. From 1805 to 1808 he was with a private tutor at Woodnesborough, near Sandwich. In 1808-9 he entered in London, he studied for the autumn of 1809 to 1812 at the university of Edinburgh, then the academic centre of Liberalism, and dwelt in the house of Professor John Playfair. On leaving the university, he travelled in Portugal and Spain, but on the 4th of May 1813 he was returned for the ducal borough of Tavistock and thereupon came back to England.

In foreign politics Lord John Russell's oratorical talents were especially shown in his struggles to prevent the union of Norway and Sweden. In domestic questions he cast in his lot with those who opposed the repressive measures of 1817, and protested that the causes of the discontent at home should be removed by remedial legislation. When failure attended all his efforts he resigned his seat for Tavistock in March 1817, and meditated permanent withdrawal from public life, but was dissuaded from this step by the arguments of his friends, especially his brother-in-law, and the first parliament of Lord Torrington, and in May 1819 began his long advocacy of parliamentary reform by moving for an inquiry into the corruption which prevailed in the Cornish constituency of Grampound. During the first parliament (1820-26) of George IV. he sat for the county of Huntingdon, and in 1821 the disfranchisement of Grampound, but the seats were not transferred to the constituency which he desired. Lord John Russell paid the penalty for his advocacy of Catholic emancipation with the loss in 1826 of his seat for Huntingdon county, but he found a shelter in the Irish borough of Bandon Bridge. He led the attack against the Test Acts by carrying in February 1828 with a majority of forty-four a motion for a committee to inquire into their operations, and after this decisive victory they were repealed (9th of May 1828). He warmly supported the Wellington ministry when it realized that the ministry government then in power was only carried on by the passing of a Catholic Relief Act (April 1829). For the greater part of the short-lived parliament of 1830-31 he served his old constituency of Tavistock, having been beaten in a contest for Bedford county at the general election by one vote; and when Lord Grey's
RUSSELL, J. S.

Reform ministry was formed, in November 1830. Lord John Russell accepted the office of paymaster-general without a seat in the cabinet. This exclusion was the more remarkable in that he was chosen (1st of March 1831) to explain the provisions of the Reform Bill, to which the cabinet had given its formal sanction. The Whig ministry was soon defeated, but an appeal to the country increased the number of their adherents, and Lord John Russell was returned by the freeholders of Devon. After many a period of doubt and defeat, "the bill, the whole bill, and nothing but the bill" passed into law (7th of June 1832), and Lord John stood forth in the mind of the people as its champion. After the passing of the Reform Bill he sat for the S. division of Devon, and continued to retain the place of paymaster-general in the ministries of Lord Grey and Lord Melbourne. The former of these cabinets was broken up by the withdrawal of Mr. Stanley, afterwards Lord Derby.

Lord John Russell had visited Ireland in the autumn of 1833 and had come back with a keen conviction of the necessity for readjusting the revenues of the Irish church. To these views he gave expression in a debate on the Irish Tithe Bill (May 1834), whereupon Stanley, with the remark that "Johnny has upset the coach," resigned his place. The latter was abruptly, if not rudely, dismissed by William IV. when the death of Lord Spencer promoted the leader of the House of Commons, Lord Althorp, to the peerage, and Lord John Russell was proposed as the spokesman of the ministry in the Commons (Nov. 1834). At the general election which ensued the Tories received a considerable accession of strength, but not sufficient to ensure their continuance in office, and the adoption by the House of Commons of the resolution, that the surplus funds of the Irish church should be applied to general education, necessitated the resignation of Sir Robert Peel's ministry (April 1835). In Lord Melbourne's new administration Lord John Russell became home secretary and leader of the House of Commons, but on his seeking a renewal of confidence from the electors of Devon he was defeated and went into opposition. The Whig ministry succeeded in passing a Municipal Reform Bill (7th of Sept. 1835), and a settlement of the tithe question in England and Ireland (1836). In May 1839, on an adverse motion concerning the administration of Jamaica, the ministry was left with a majority of five only, and promptly resigned. Sir Robert Peel's attempt to form a ministry was, however, frustrated by the refusal of the queen to dismiss the ladies of the bedchamber, and the Whigs resumed their places with Lord John Russell as secretary of state for the colonies. Their prospects brightened when Sir John Yarde-Buller's motion of "no confidence" at the opening of the session of 1840 was defeated by twenty-one, but a similar vote was some months later carried by a majority of one, whereupon the Whig leader announced a dissolution of parliament (June 1841). At the polling-booth his friends sustained a crushing defeat; the return of Lord John Russell for the City of London marked the military triumph.

On Sir Robert Peel's resignation (1846) the task of forming an administration was entrusted to Lord John Russell, and he remained at the head of affairs from July 1846 to Feb. 1848, but his tenure of office was not marked by any great legislative enactments. His celebrated Durham letter (4th of Nov. 1840) on the threatened assumption of ecclesiastical titles by the Roman Catholic bishops weakened the attachment of the "Peelites" and alienated his Irish supporters. The impotence of their opponents, rather than the strength of their friends, kept the Whig ministry in power, and, although beaten by a majority of nearly two to one on Mr. Locke King's County Franchise Bill in February 1851, it could not divest itself of office. Lord Palmerston's unauthorised recognition of the French coup d'état was followed by his dismissal from the post of foreign secretary (Dec. 1851), but he had his revenge in the ejection of his late chief, Lord Melbourne, in the autumn of 1852. During Lord Aberdeen's administration Lord John Russell led the Lower House, at first as foreign secretary (to the 21st of February 1853), then without portfolio, and lastly as president of the council (June 1854). In 1854 he brought in a Reform Bill, but in consequence of the war with Russia the bill was allowed to drop. His popularity was diminished by this failure, and although he resigned in January 1855, on Mr. Roebuck's motion for an inquiry into the conduct of the war in the Crimea, he did not regain his old position in the country. At the Vienna conference (1855) Lord John Russell was England's representative, and immediately on his return he became secretary of the colonies (May 1855), but the errors in his negotiations at the Austrian capital followed him and forced him to retire in July of the same year.

For some years after this he was the "stormy petrel" of politics. He was the chief instrument in defeating Lord Palmerston in 1857. He led the attack on the Tory Reform Bill of 1830. A reconciliation was then effected between the rival Whig leaders, and Lord John Russell consented to become foreign secretary in Lord Palmerston's ministry (1860) and to accept an earldom (July 1861). During the American War Earl Russell's sympathies with the North restrained his country from taking sides in the contest, and he warmly sympathized with the efforts for the unification of Italy, but he was not equally successful in preventing the spoliation of Denmark. On Lord Palmerston's death (October 1865) Earl Russell was once more summoned to form a cabinet, but the defeat of his ministry in the following June on the Reform Bill which they had introduced was followed by his retirement from public life. His leisure hours were spent after this event in the preparation of numberless letters and speeches, and in the composition of his Recollections and Suggestions (1875), but everything he wrote was marked by the belief that all philosophy, political or social, was summed up in the Whig creed of fifty years previously. Earl Russell died at Pembroke Lodge, Richmond Park, 28th May 1878.

Earl Russell was twice married—first in 1835, to Adelaide, daughter of Mr. Thomas Lister, and widow of Thomas, second Lord Ribblesdale, and secondly, in 1841, to Lady Frances Ann Maria, daughter of Gilbert, second earl of Minto. By the former he had two daughters, by the latter three sons and one daughter. His eldest son, Lord Aberley, who married a daughter of the second Baron Stanley of Alderley, predeceased him on the 9th of January 1876, and their eldest son (b. 1865) succeeded as second Earl Russell.

Lord Russell played some part as an author. His tales, tragedies and essays (including The Nun of Arrouca, 1822, and Essays and Sketches by a Gentleman who has left his Lodgings, 1820) are forgotten, but his biographies, such as Lord Russell (1819), Memoirs of the Affairs of Europe (1824-29, 2 vols.), Correspondence of John, 4th Duke of Bedford (1842-46, 3 vols.), Memorials and Correspondence of C. J. Fox (1853-57, 4 vols.) and Life and Letters of Fox, and poems are among the chief authorities on Whig politics. He also edited the Memoirs, Journal and Correspondence of Thomas Moore (1853-56, 8 vols.).

The chief biography is that by Sir Spencer Walpole (1859, 2 vols.). The volume by Stuart J. Reid (1865, "Prime Ministers of Queen Victoria" Series) should also be consulted. (W. P. C.)

RUSSELL, JOHN SCOTT (1808-1888), British engineer, was born in 1808 near Glasgow, a "son of the manse," and was at first destined for the ministry. But this intention on his father's part was changed in consequence of the boy's early leanings towards practical science. He attended in succession the universities of St Andrews, Edinburgh and Glasgow,—taking his degree in the last-named at the age of sixteen. After spending a couple of years in workshops, he settled in Edinburgh as a lecturer on science, and soon attracted large classes. In 1832-33 he was engaged to give the natural philosophy course at the university, the chair having become vacant by the death of Sir John Leslie. In the following year he began his remarkable series of observations on waves. Having been consulted as to the possibility of utilizing steam-navigation on the Edinburgh & Glasgow Canal, he replied that the work was a failure without experiment, which he was willing to undertake if a portion of the canal were placed at his disposal. The results of this inquiry are to be found in the Trans. Roy. Soc. Ed. (vol. xiv.), and in the British
RUSSELL, T.—RUSSELL, SIR W. H.

Association Reports (seventh meeting). The existence of the long wave, or wave of translation, with many of its most important features, was here first recognized, and it was clearly pointed out why there is a special rate, depending on the depth of the water, at which a canal-boat can be towed at the least expenditure of effort by the horse. The elementary mathematical theory of the long wave was soon supplied by commentators on Scott Russell's work, and a more complete investigation was subsequently given by Sir G. G. Stokes. Russell indulged in many extraordinary and groundless speculations, some of which were published in a posthumous volume, The Wave of Translation (1885). His observations led him to propose and experiment on a new system of shaping vessels, known as the wave system, which culminated in the building of the "Great Eastern." His activity and ingenuity were also displayed in many other fields—steam-coaches for roads, improvements in boilers and in marine engines, the immense iron dome of the Vienna Exhibition, cellular double bottoms for iron ships, &c. With Mr. Stafford Northcote (afterwards Lord Iddesleigh), he was joint-secretary of the Great Exhibition of 1851; and he was one of the chief founders of the Institution of Naval Architects. He died at Ventnor on the 8th of June 1882.

RUSSELL, THOMAS (1762-1788), English poet, was born at Beaminster, early in 1762. He was the son of John Russell, an attorney at Bridport, in Dorsetshire, and his mother was Miss Virtue Brickle, of Shaftesbury. He was educated at the grammar school of Bridport, and in 1777 proceeded to Winchester, where he stayed three years, under Dr Joseph War ton, and Thomas War ton, the professor of poetry. In 1780 Russell became a member of New College, Oxford. He graduated B.A. in 1784 and was ordained priest in 1786. During his residence at the university he devoted himself to French, Italian, Spanish, Portuguese, Provencal and even German literature. His health, however, broke down, and he retired to Bristol hot wells to drink the waters; but in vain, for he died there on the 31st of July 1788. He was buried in Powerstock churchyard, Dorset. In 1789 was published a thin volume, containing his Sonnets and Miscellaneous Poems, now a very rare book. It contained twenty-three sonnets, of regular form, and a few paraphrases and original lyrics. The sonnets are the best, and it is by right of these that Russell takes his place as one of the most interesting precursors of the romantic school. "War, Love, the Wizard, and the Fay he sung"—in other words, he rejected entirely the narrow circle of subjects laid down for 18th-century poets. In this he was certainly influenced both by Chatterton and by Collins. But he was still more clearly the disciple of Petrarch, Boccaccio and of Chaucer, of whom he had carefully and enthusiastically studied. His sonnet, "Suppos'd to be written at Lemnos," is his masterpiece, and is unquestionably the greatest English sonnet of the 18th century.

The anonymous editor of Russell's solitary volume is said to have been William Howley (1766-1848), long afterwards archbishop of Canterbury, whose father, William, was a tutor at New College, Oxford, when Russell, who had been his tutor, died. His memoir of the poet is very perfunctory, and the fullest account of Russell is that published in 1897 by T. Seccombe.

RUSSELL, WILLIAM CLARK (1844- ), British author, was born at the Carlton House Hotel, New York, on the 24th of February 1844, the son of Henry Russell, author of "Cheer, Boys, Cheer," and other popular songs. He went to school at Winchester, and then at Boulogne, joining the merchant service at thirteen, and serving for eight years. This apprenticeship to a seafaring life was turned to account in a series of stories which have fascinated two generations of boy readers. John Holdsworth, Chief Mate (1874), immediately made his reputation. Other successful stories were: The Wreck of the Grosvenor (1873), in which he pleaded for better food for English seamen; The Frozen Pirate (1877), An Ocean Tragedy (1881), The Emigrant Ship (1894), The Ship, Her Story (1894), The Convict Ship (1895), What Cheer! (1895), The Two Captains (1897), The Romance of a Midshipman (1898), The Ship's Adventure (1899), Overdue (1903), Abandoned (1904), His Island Princess (1905). He joined the staff of the Newcastle Daily Chronicle, and afterwards became a leader writer on the Daily Telegraph, but the double labour of journalism and novel-writing threatened his health, and he resigned in 1887. Many of the papers which he contributed to the Daily Telegraph were collected in volume form in Round the Galley Fire and other volumes. He also wrote a Life of Lord Collingwood (1891), and, with W. H. Jacques, Nelson and the Naval Supremacy of England (New York, 1890).

RUSSELL, SIR WILLIAM HOWARD (1821-1907), English war correspondent, was born at Lillylake, near Tallaght, in the county of Dublin, on the 28th of March 1821, being one of the Russians of Limerick, whose settlement in Ireland dates from the time of Richard II. He entered Trinity College in 1838. Three years later he was thrown very much on his own resources, but a relative, Mr. W. R. Russell, who had been sent to Ireland by the Times, deputed him to report the Irish elections at Longford, and his success definitely turned his attention to journalism. Coming to London in 1842, he went to Cambridge, but left before taking a degree. In the following year he was sent by The Times to Ireland to report the O'Connell meetings. In 1845 he was appointed to superintend the reports on the Irish railways, and was shortly afterwards sent by The Times to inspect the O'Connell property in S.W. Ireland, when his plain speaking drew forth a characteristic tirade from the "Liberator." For a short period in 1847 his services were temporarily transferred to the Morning Chronicle, but with that exception he remained permanently connected with The Times. He was sent as special correspondent to Denmark in the war of 1849-50. He did not, however, at once relinquish a legal career, and was called to the bar at the Middle Temple in 1851. On the outbreak of the Crimean War in 1853 he went out as special correspondent, and, accompanying the light division to Gallipoli, proceeded with the first detachment to Varna. On the embarkation for the Crimea he was attached to the second division, and landed with it on the 14th of September. He was present at the battle of the Alma on the 20th of September, at the investment of Sevastopol, at Balaklava on the 25th of October and Inkerman on the 6th of November.

Towards the end of May 1855 he accompanied the expedition to Kertch, and did not return to the Crimea until the following August. In September and October he described the attacks on the Malakoff and Redan, the occupation of Sevastopol and the capture of Fort Kinburn. The popularity of The Times Crimea correspondence led to its republication in two volumes under the title of The War, 1855-56. Russell's letters to The Times were mainly responsible for the enlightenment of the public at home as to the conduct of affairs at the scene of action, and his exposure of the mismanagement during the winter of 1854 did more than anything else to cause the downfall of Lord Aberdeen's ministry. In 1856 Russell was sent to Moscow to describe the coronation of the tsar, and in the following year was attached to the headquarters of Lord Clyde in India. He was present at the siege and capture of Lucknow in 1858, the operations in Oude, the battle of Bareilly and the actions in Rohilkhand, and he received the Indian war medal with the Lucknow clasp. The events of those stirring times are vividly recorded in My Diary in India in 1858-59. Next year he was sent to Italy, but arrived on the eve of the armistice at Villa franca. On the 7th of January 1860 appeared the first number of the Army and Navy Gazette, which he founded, and of which he was editor and joint proprietor. In 1861 Russell proceeded to Washington, and reached M'Dowell's headquarters just before the first battle of Bull Run, and his account of the Federal retreat drew much hostile criticism. He published a full account of the war, in so far as he had witnessed it, in My Diary, North and South, during the Civil War in America, 1862. Returning to England in 1863, he remained at home until 1866, when he proceeded to the headquarters of General Benedek and witnessed the battle of Königgrätz, 3rd of July.
During the interval of peace that followed he accompanied the prince of Wales to the Nile, Constantiople, the Crimea and Greece in 1668, and published an account of the voyage in 1674. He also contested the borough of Chelsea unsuccessfully in the Conservative interest. On the outbreak of the Franco-Prussian War in 1870, Russell was with the crown prince from the battle of Wörth, 6th of August, and Sedan, 12th of September, till the capitulation of Paris. His account appeared in 1874 under the title of My Diary during the Last Great War. His description of the burning of Paris by the Communaux was not the least of his journalistic triumphs. In 1875-76 he was honorary private secretary to the prince of Wales during his tour through India, of which he published an account in 1877. When Lord Wolseley was sent to quell the Zulu rebellion in 1879, Russell was attached to his staff as correspondent. In 1881 he went with the duke of Sutherland’s party for a tour in the United States and Canada, described in Hesperothen, and in 1882 he was again with Lord Wolseley in the Egyptian campaign. In 1895 he published a personal retrospect entitled The Great War with Russia. Russell was knighted in May 1895, and was the recipient of numerous war medals and various foreign orders. He married twice, first in 1846 Miss Burrowes, who died not long afterwards, and secondly in 1884 the Countess A. Malvezzi. He died on the 12th of February 1895.

RUSSELL, LORD WILLIAM (1639-1683), English politician, was the third son of the 1st duke of Bedford and was born on the 29th of September 1639. About 1654 he was sent to Cambridge with his elder brother Francis (on whose death in 1658 he obtained the courtesy title of Lord Russell). On leaving the university, the two brothers travelled abroad, visiting Lyons and Geneva, and residing for some while at Augsburg. William’s account of his impressions is spirited and interesting. He was at Paris in 1658, but had returned to Woburn in December 1659. At the Restoration he was elected for the family borough of Tavistock. For a long time he appears to have taken no part in public affairs, but rather to have indulged in the follies of court life and intrigue; for both in 1665 and 1664 he was engaged in duels, in the latter of which he was wounded. In 1669 he married Rachel (1663-1723), second daughter of the 4th earl of Southampton, and widow of Lord Vaughan, thus becoming connected with Shaftesbury, who had married Southampton’s niece. With his wife Russell always lived on terms of the greatest affection and confidence. She corresponded with Tillotson and other distinguished men, and a collection of her admirable letters was published in 1723.

It was not until the formation of the “country party,” in opposition to the policy of the Cabal and Charles’s French-Catholic plots, that Russell began to take an active part in affairs. He then joined Cavendish, Birch, Hampden, Powell, Lyttleton and others in vehement antagonism to the court. With a passionate hatred and distrust of the Catholics, and an intense love of political liberty, he united the desire for ease to Protestant Dissenters. His first speech appears to have been on the 22nd of January 1673, in which he inveighed against the stop of the exchequer, the attack on the Smyrna fleet, the corruption of courtiers with French money, and “the ill ministers about the king.” He also supported the proceedings against the duke of Buckingham. In 1675 he moved an address to the king for the removal of Danby (see LEEDS, DUKE OF) from the royal councils, and for his impeachment. On the 13th of February 1677, in the debate on the fifteen months’ prorogation, he moved the dissolution of parliament; and in March 1678 he seconded the address praying the king to declare war against France. The enmity of the country party against Danby and James, and their desire for a dissolution and the disbanding of the army, were greater than their enmity to Louis. The French king therefore found it easy to form a temporary alliance with Russell, Hollis and the opposition leaders, by which they engaged to cripple the king’s power of hurting France and to compel him to seek Louis’s friendship,—that friendship, however, to be given only on the condition that they in their turn should have Louis’s support for their cherished objects. Russell in particular entered into close communication with the marquis de Tullot (Lady Russell’s maternal uncle), who came over with money for distribution among members of parliament. By the testimony of Barillon, however, it is clear that Russell himself utterly refused to take any part in the intended corruption.

By the wild alarms which culminated in the Popish Plot Terror Russell appears to have been affected more completely than his otherwise sober character would have led people to expect. He threw himself into the party which looked to Monmouth as the representative of Protestant interests, a grave political blunder, though he afterwards was in confidential communication with Orange. On the 4th of November 1678 he moved an address to the king to remove the duke of York from his person and councils. At the dissolution of the pensionary parliament, he was, in the new elections, returned for Bedfordshire. Danby was at once overthrown, and in April 1679 Russell was one of the new privy council formed by Charles on the advice of Temple. Only six days after this we find him moving for a committee to draw up a bill to secure religion and property in case of a popish successor. He does not, however, appear to have taken part in the exclusion debates at this time. In June, on the occasion of the Covenanters’ rising in Scotland, he attacked Lauderdale personally and publicly, and on the 13th carried the bill to the House of Lords for their concurrence. The limitation scheme he opposed, on the ground that monarchy under the conditions expressed in it would be an absurdity. The statement, made by Echard alone (Hist. of England, ii.), that he joined in opposing the indulgence shown to Lord Strafford by Charles in dispensing with the more horrible parts of the sentence of death—an indulgence afterwards shown to Russell himself—is entirely unworthy of credence. On December 18 he moved to refuse supplies until the king passed the Exclusion Bill. The prince of Orange having come over at this time, there was a tendency on the part of the opposition leaders to accept his endeavours to support them and to compromise on the exclusion question. Russell, however, refused to give way a hair’s breadth.

On the 26th of March 1681, in the parliament held at Oxford, Russell again seconded the Exclusion Bill. Upon the dissolution he retired into privacy at his country seat of Stratton in Hampshire. It was, however, no doubt at his wish that his chaplain wrote the Life of Julian the Apostate, in reply to Dr Hickey’s sermons, in which the lawfulness of resistance in extreme cases was defended. In the wild schemes of Shaftesbury after the election of Tory sheriffs for London in 1682 he had no share; upon the violation of the charters, however, in 1683, he began seriously to consider as to the best means of resisting the government, and on one occasion attended a meeting at which treason, or what might be construed as treason, was talked. Monmouth, Essex, Hampden, Sidney and Howard of Escrick were the principal of those who met to consult. On the breaking out of the Rye House Plot, of which neither he, Essex, nor Sidney had the slightest knowledge, he was accused by informers of promising his assistance to raise an insurrection and compass the death of the king. Refusing to attempt escape, he was brought before the council, when his attendance at the meeting referred to was charged against him. He was sent on the 26th of June 1683 to the Tower, and, looking upon himself as a dying man, betook himself wholly to preparation for death. Monmouth offered to appear to take his trial, if thereby he could help Russell, and Essex refused to abscond for fear of injuring his friend’s chance of escape. Before a committee of
RUSSIL OF KILLOWN, LORD

the council Russell, on the 28th of June, acknowledged his presence at the meeting, but denied all knowledge of the proposed insurrection. He reserved his defence, however, until his trial. He would probably have saved his life but for the perjury of Lord Howard. The suicide of Essex, the news of which was brought into court during the trial, was quoted as additional evidence against him, as pointing to the certainty of Essex's guilt. On July 19 he was tried at the Old Bailey, his wife assisting him in his defence. Evidence was given by an in-former that, while at Shaftesbury's hiding-place in Wapping, Russell had joined in the proposal to seize the king's guard, a charge indignantly denied by him in his farewell paper, and that he was one of a committee of six appointed to prepare the scheme for an insurrection. Howard, too, expressly declared that Russell had urged the entering into communications with Argyll in Scotland. Howard's perjury is clear from other witnesses, but the evidence was accepted. Russell spoke with spirit and dignity in his own defence, and, in especial, vehemently denied that he had ever been party to a design so wicked and so foolish as those of the murder of the king and of rebellion. It will be observed that the legality of the trial, in so far as the jurors were not properly qualified and the law of treason was shamefully strained, was denied in the act of 1 William & Mary which annulled the attainder. Hallam maintains that the only overt act of treason proved against Russell was his concurrence in the project of a rising at Taunton, which he denied, and which, Ramsay being the only witness, was not sufficient to warrant a conviction.

Russell was sentenced to die. Many attempts were made to save his life. The old earl of Bedford offered £50,000 or £100,000, and Monmouth, Legge, Lady Ranelagh, and Rochester added their intercessions. Russell himself, in petitions to Charles and James, offered to live abroad if his life were spared, and never again to meddle in the affairs of England. He refused, however, to yield to the influence of Burnet and Shaftesbury, who endeavoured to reconcile him to the uselessness of rebellion; and the judge, although more than probable that compliance in this would have saved his life. He drew up, with Burnet's assistance, a paper containing his apology, and he wrote to the king a letter, to be delivered after his death, in which he asked Charles's pardon for any wrong he had done him. A suggestion of escape from Lord Cavendish he refused. He behaved with his usual quiet cheerfulness during his stay in the Tower, spending his last day on earth as he had intended to spend the following Sunday if he had reached it. He received the sacrament at Tilston, and Burnet twice preached to him. Having supped with his wife, the parting from whom was his only great trial, he slept peacefully, and spent the last morning in devotion with Burnet. He went to the place of execution in Lincoln's Inn Fields with perfect calmness, which was preserved to the last. He died on the 21st of July 1685, in the forty-fourth year of his age. His attained was received in 1699. He left a will (1697, 1711) succeeded his grandfather as 2nd duke of Bedford in 1700. A true and moderate summing-up of his character will be found in his Life, by Lord John Russell (1820).

RUSSIL OF KILLOWN, CHARLES RUSSELL, BARON (1832-1900), lord chief justice of England, was born at Newry, county Down, on the 10th of November 1832. He was the elder son of Arthur Russell, a Roman Catholic gentleman, who was engaged in commerce and brewing in Newry. Educated first at Belfast, afterwards in Newry, and finally at St Vincent's College, Castleknock, Dublin, in 1849, he was articled to a firm of solicitors in Newry. In 1854 he was admitted, and began to practise his profession. Disturbances between Roman Catholics and Orangemen were at that time prevalent in this part of Ireland, and in the legal proceedings which ensued at quarter and petty sessions young Russell distinguished himself as a bold and skilful advocate in the cause of his co-religionists. The political zeal which always formed an important element in Russell's character happily harmonized with these professional duties. After practising, however, for two years, he determined to seek a wider field for his abilities, and to become a barrister in England. It was a wise ambition, early conceived by young Russell, stimulated by his present success, and encouraged by the counsel of at least one competent adviser, Judge Jones, who was much impressed by Russell's ability in the conduct of a case at the Newry quarter sessions. He believed, moreover, that to succeed at the Irish bar he would have (to use his own phrase) to "swallow his convictions." With this end in view Russell, whilst still practising and residing in Belfast, became a student of Trinity College, Dublin. He matriculated there in 1855, and passed examinations from time to time, but did not wait to become a graduate. In 1856 he went to London and became a student of Lincoln's Inn. In 1858 he married, in Belfast, Ellen, the eldest daughter of Dr Mulholland, a physician of distinction in that city. In 1859 he was called to the bar, after gaining by examination a first-class honour certificate, and joined the Northern Circuit. Except some valuable introductions to friends in London and Liverpool, which his uncle, the president of Maynooth, had given to him, Russell brought to the work of his profession no external aids. He had to rely upon himself. But the equip-ment was sufficient. A well-built frame; a strong, striking face, with broad forehead, keen grey eyes, and a full and sensitive mouth; a voice which, though not musical, was rich, and responded well to strong emotions, whether of indignation, or scorn, or pity; an amazing power of concentrating thought; an intellectual grasp, promptly seizing the real points of the most entangled case, and rejecting all that was secondary, or petty, or irrelevant; a faculty of lucid and forcible expression, which, without literary ornateness or grace of style, could on fit occasions rise to impassioned eloquence—all these things Russell had. But beyond and above all these was his immense personality, an embodiment of energetic will which riveted attention, dominated his audience, and bore down opposition. His successful advocacy in the Colin Campbell divorce case in 1886, and his famous cross-examination of hostile witnesses (in the so-called famous speech before the House of Lords in 1888), afforded perhaps the best examples of Russell's characteristic powers. He was not a learned lawyer in the sense in which Willes, or Mellish, or Blackburn were learned lawyers; he did not possess the fine legal acumen of his great contemporary, Herschell; but he had a sufficient apprehension of legal principles. He handled a point of law with telling directness and force. His argument as the leading counsel for Great Britain in the Bering Sea Arbitration in 1893, and his address at Saratoga Springs on International Law and International Arbitration in August 1896, were expositions of law in its practical application to matters of state which the most learned jurist must admire for their thoroughness and perspicuity. Russell's success, after he joined the Northern Circuit, did not, of course, come to him at once. For some time his work in court was principally in the Court of Passage at Liverpool, where he regularly attended from London. He wrote his book on its procedure, which were published in 1862. This ancient local court, possessing both common law and Admiralty juris-diction, had as its presiding judge—then styled "assessor"—an eminent leader of the Northern Circuit, Mr Edward James. Substantial commercial cases were tried there, and of these Russell soon had a goodly portion. Steadily, and, for a barrister, speedily, Russell's fortune grew. His biographer, Mr Barry O'Brien, has given, in The Life of Lord Russell of Killown (1901), an account of Russell's fees, which shows that they were, in round figures: in 1859, £717; in 1862, £506; in 1866, £2367; and in 1870, £4230. At the beginning of this period Russell wrote occasionally for the newspapers, and especially for the Irish press. From early boyhood onwards he maintained a keen interest in politics, and pre-eminently in the public affairs of Ireland. In 1859 he published a pamphlet entitled The Catholic in the Workhouse, and an article from his pen is to be found in The Dublin Review, vol. viii, p. 497. His legal work was not wholly confined to the north of England. He was employed at the Guildhall and elsewhere by solicitors of position in the City of London. He was one of the counsel engaged in
the Windmill lunacy case in 1861, and in the action of Saurin v. Starr in 1869. In 1865 he argued in ex parte Chavasse before Lord Westbury, L.C., and soon afterwards was honoured by him with the offer of a county court judgeship.

In 1872 Russell took "silk," and from that date for some time he divided the best leading work of the circuit with Holker, Herschell and Pope. In 1874 Holker became solicitor-general in the Conservative administration. In 1880 Herschell accepted the same office in a Liberal ministry, and about the same time Pope practically left the circuit, to become in a short time one of the most successful advocates at the parliamentary bar.

Russell's success as a Q.C. during this period of his career was prodigious. He excelled in the conduct alike of commercial cases and of those involving, as he used to say, "a human interest," although undoubtedly it was the latter which more attracted him. He was seen to the least advantage in cases which involved technical or scientific detail. If his advocacy suffered a defeat, however, it was never an inglorious defeat. Those who were on the Northern Circuit at the time will not easily forget the case of Dixon v. Plimson—a libel action brought by a Liverpool shipowner against Mr. S. Plimson (afterwards Sir S. Plimson) for a libel on the shipowner and a Liverpool special jury, in which Holker won a notable victory for the defendant; or Nuttall v. Wilde, a breach of promise action, in which Pope led brilliantly for the successful plaintiff, and Russell's speech for the defence was one of the finest in point of passion and pathos that was ever heard upon the Northern Circuit. At the same time, with all his fighting power, Russell was eminently a sagacious advocate. No barrister knew better how and when to settle a case, where the client's true interest called for a settlement.

In 1880 a new phase of Russell's arduous life began. He was returned to parliament as an independent Liberal member for Dundalk, a constituency which he had twice before unsuccessfully contested. From that time forward until his appointment to a lordship of appeal in succession to Lord Bowen in 1894, he sat in the House of Commons for Dundalk until 1885, and afterwards for South Hackney, where he was returned as the Liberal member on four successive occasions—once in 1885, twice in 1886, and again in 1892. The entrance into parliament laid upon Russell's time and labour a heavy additional tax. His was a nature which could not, in work or even in pleasure, be content to do anything lightly or by halves. He was essentially a man of action; intensity—at times almost fierce intensity—both of purpose and of devotion to its fulfilment characterized everything he did. Upon such a man parliamentary life between 1880 and 1894 necessarily entailed a severe strain. During the whole of this epoch, in home affairs, Irish business almost monopolized the political stage; and Russell was Irish to the core. From 1880 to 1886, as a private member, and as the attorney-general in Mr Gladstone's administrations of 1886 and 1892, he worked in and out of parliament for the Liberal policy in regard to the treatment of Ireland as few men except Russell could or would work. He never spared himself. After a long day in the turmoil of the courts, he cheerfully gave a long evening to a distant and often, from the standpoint of personal notoriety, an obscure, platform. His position throughout was clear and consistent. Before 1886 on several occasions he supported the action of the Irish Nationalist party. He opposed the votes for compensation for disturbance, advocated the release of political prisoners and voted for the Maamtrasna inquiry. He wrote to the Daily Telegraph a series of letters on the Irish land question, which were afterwards published (1886) in a collected form. But he never became a member of the Irish Home Rule or of the Parnellite party; he was elected at Dundalk as an independent Liberal, and such he remained. He was proud of the kingdom in whose might and glory Ireland could claim so large a part; and when, as attorney-general in the Gladstone administration, he warmly advocated the establishment of a subordinate parliament in Ireland, he did so because he sought the amelioration and not the destruction of Ireland's relations with the rest of that kingdom. "I am absolutely opposed," he said (The Life of Lord Russell of Kilowen, p. 194) to the South Hackney voters, "to separation; but, reserving imperial control on all imperial questions, I think Irishmen on Irish soil should have the power of dealing in the way which seems best to them with all questions that concern them." It is impossible to say that Russell's success in the House of Commons, considerale as it was, was comparable to his success as an advocate in the courts of justice. He was listened to, always with respect and often with admiration, but he was not made for a debater; and the position of a law officer has generally not proved favourable to the attainment of parliamentary eminence. In great public affairs the law officer advises and supports, but not for him is the glory of initiating public policy.

Russell's parliamentary duties, fully as he discharged them, first as a private member and afterwards as attorney-general, were not allowed by him to obstruct his professional career. He rapidly became in London what he was already in Lancashire, the favourite leader in nisi prius actions. The list of cases célèbres in the period 1880-94 is really a record of Russell's cases, and, for a great part, of Russell's victories. The single most famous was the libel action Bell v. Loscus in 1889, which, after a trial before Baron Huddleston and a special jury lasting more than forty days, resulted in a verdict for the plaintiff, for whom Sir Hardinge Giffard (afterwards Lord Chancellor Halsbury) appeared as leading counsel. The triumph of his client in the Colin Campbell divorce suit in 1886 afforded perhaps the most brilliant instance of Russell's forensic capacity in private litigation. His fees in 1885, the year before he became attorney-general, amounted to nearly £17,000. More important, however, as well as more famous, than any of his successes in the ordinary courts of law during this period were his performances as an advocate in two public transactions of mark in British history. The first of these in point of date was the Parnell Commission of 1888-90, in which Sir Charles Russell appeared as leading counsel for Mr Parnell. The commission held its first sitting on the 22nd of October 1888, and presented its report in February 1890. In April 1889, after 63 sittings of the commission, in the course of which 340 witnesses had been examined, Sir Charles Russell, who had already destroyed the chief personal charge against Mr Parnell by a brilliant cross-examination, in which he proved it to have been based upon a forgery, made his great opening speech for the defence. It lasted several days, and concluded on the 12th of April. This speech, besides its merit as a wonderful piece of advocacy, possesses permanent value as an historical survey of the Irish question during the last century, from the point of view of an Irish Liberal. It was in the same year published after careful revision by its author (1889). The second public transaction was the Bering Sea Arbitration, held in Paris in 1893. Sir Charles Russell, then attorney-general, with Sir Richard Webster (afterwards Lord Alverstone, L.C.J.), was the leading counsel for Great Britain. Russell, in the course of his very powerful argument before the tribunal, maintained the proposition, which he again handled in his Saratoga address to the American Bar Association in 1892, that "international law is neither more nor less than what civilized nations have agreed shall be binding on one another as international law." The award was, substantially, in favour of Great Britain. In recognition of their distinguished services the two judges were awarded the queen's commendation upon both the leading representatives of Great Britain the honour of the grand cross of St Michael and St George.

In 1894 Russell's career as an advocate ended. A judgeship, if he had wished it, had been within his reach twelve years before. In 1894, on the death of Lord Bowen, he accepted the position of a lord of appeal. A month later he was appointed lord chief justice of England in succession to Lord Coleridge, to whose memory he devoted in the following September a paper in the North American Review. To the discharge of his functions as a judge Russell brought with him all the qualities of intellect and character which had made him so eminent as an advocate, and their greatness was not less conspicuous in his
new position. Brief as was his tenure of the office, he proved himself well worthy of it. He was dignified without pompous-ness, quick without being irritable, and masterful without tyranny. He was scrupulously punctual. Suitsors and hearers could not but be impressed by the most grave determination of the lord chief justice to get at the truth, and to do so without waste of time. If this was a fault, it was that of excessive zeal for despatch. When, occasionally, there were flashes of impatience, they were elicited by the exhibition, as he deemed it, of want of preparation, or slovenliness, or ver-

osity on the part of the advocate before him. Even the youngest and most obscure practitioner could always count upon the assiduous attention of the lord chief justice to a pertinent and thoughtful argument. In 1866 Lord Russell (Pollock B. and Hawkins J. being on this occasion his colleagues on the bench) presided at the trial at bar of the leaders of the Jameson Raid. It was a state trial of grave importance. Russell's conduct of it, in the midst of much popular excitement, was by itself sufficient to establish his reputation as a great judge. One other event at least in his career while lord chief justice deserves a record, namely, his share in the Venezuela Arbitration in 1899. Lord Herschell, who had been nominated to act with Lord Justice Collins (afterwards Master of the Rolls) as a British representative on the Commission of Arbitration, of which the distinguished Russian jurist M. Martens was president, died somewhat suddenly in America before the commencement of the proceedings. The lord chief justice accepted the invitation to take the vacant place, and performed his very onerous duty with conspicuous ability.

Nor was it only on the bench or as an international judge that Lord Russell of Killowen sought, during the last years of his busy life, to do service to his country. He signalized his zeal as a law reformer by the public advocacy of radical changes in the system of legal education in the Inns of Court, and by the promotion of measures to put down the vice of secret and illicit commissions in commercial and business life. On the former subject he delivered in 1893 an address in Lincoln's Inn Hall, under the auspices of the Council of Legal Education, which was afterwards printed and published. In 1899, dealing with the latter question, he introduced in the House of Lords a bill, which had its first reading. He again introduced a bill in the session of 1900, which was read a second time, but did not become law. On the 10th of August 1900 the great advocate and great judge passed quietly away at his London residence, after a short illness due to an internal malady.

In his public life Russell was always strenuous, and most attracted by things that called for the exercise of activity, whether bodily or intellectual. Inaction he disliked both for himself and in others. Though not an athlete, he took an interest in manly pastimes: he was fond of riding and of breeding horses; he liked being on the racecourse; and he enjoyed games, both of skill and of chance. A student of books, he was not; he could lay no claim to wide learning or elegant scholarship; but he could appreciate a good book; he was versed in Shakespeare; and he knew and loved the poetry and the songs of his native land. When he wrote, his style, inorganic, clear and forcible, reflected the character of his thought. He was a staunch and sympathetic friend, ever ready, in an unostentatious way, to help, where help was really needed. While he undoubtedly exhibited at times, chiefly during the earlier part of his career, a certain brusqueness and impetuousness of speech and demeanour, those who came into contact with him recognized that such occasional outbursts never sprang from any desire to hurt, or from any unkindness of disposition. In his contests at the bar he never made an enemy. He was a strong man, and he liked to have his way; but he was also large-hearted and without a tinge of rancour in his disposition. He was never offended by opposition. Whilst he did not himself shine as a wit or a humorist in conversation or in after-dinner oratory, he heartily enjoyed fun and humour in others; and, wherever he was, the force and distinctness of his personality never failed to impress his company. Probably no English lawyer ever excited abroad the admiration which was accorded to Lord Russell of Killowen, alike on the continent of Europe and in America. To the University of Dublin he had trided in the first years of 1883 and the second in 1886. On both occasions he won golden opinions, which were manifested in widespread and warm expressions of sympathy and regret when the news of the death of Lord Russell of Killowen passed across the Atlantic. Between 1894 and 1897 Lord Russell of Killowen received the degree of Doctor of Laws honoris causa from the universities of Dublin, Edinburgh and Cambridge, and from the Laval university, Quebec. In 1892 he was treasurer of Lincoln's Inn. He left surviving him, besides his widow, five sons and four daughters. His sister Katherine (in religion, Sister Mary Baptist Joseph), pioneer sister of mercy in California, had died two years before at San Francisco. (W. R. K.)

RUSSELL OF THORNHAUGH, WILLIAM, 1st BARON (c. 1558-1613), English soldier, was a younger son of Francis Russell, 2nd earl of Bedford, and was educated at Magdalen College, Oxford. After spending a few years abroad, he went to Ireland in 1590, and having seen some service in that country he was knighted in September 1581. In 1585 he joined the English forces in the Netherlands, being made lieutenant-general of cavalry; in September 1586 he so distinguished himself at Zutphen that the Spaniards pronounced him a "devil and not a man" and in 1587 he became governor of Flushing in succession to his late friend, Sir Philip Sidney. He differed with the estates of Holland and with his superior, Lord Wiltoughby de Ereshy; consequently, on his own initiative, he was recalled to England in July 1588. In May 1594 Russell was made lord deputy of Ireland in place of Sir William Fitzwilliam. He relieved Enniskillen, but his attempts to capture the insurgent leaders, Hugh O'Neill, earl of Tyrone, and Flagh MacHugh O'Byrne, came to nothing. In May 1595 Sir John Norris landed in Ireland, his orders being to help the lord deputy in his difficult task. Russell was somewhat chagrined at the choice, as he and Norris were not very good friends, but for a short time they acted together against the rebels in the N. of Ireland. Russell then led an expedition into Connaught, but soon he and Norris were at variance. Having captured O'Byrne in May 1597, Russell laid down his office and left Ireland later in the month. In 1603 he was created Baron Russell of Thornhaugh, and he died on the 9th of August 1613. In 1627 his only son Francis succeeded his cousin Edward as 4th earl of Bedford.

Russell's Journal of his doings in Ireland is in the Carew MSS., and many of his letters are in the British Museum. See J. H. Witten, Historical Memoirs of the House of Russell (1833), and R. Bagwell, Ireland under the Tudors, vol. iii. (1890).

RUSSIA (Rossiya), the general name for the European and Asiatic dominions of the "Tsar of All the Russians." Although the name is thus correctly applied, both in English and Russian, to the whole area of the Russian empire, its application is often limited, no less correctly, to European Russia, or even to European Russia exclusive of Finland and Poland. The use of the name in its most comprehensive sense dates only from the expansion of the empire in the 19th century; to the historian who writes of the earlier growth of the empire, Russia means, at most, Russia in Europe, or Muscovy, as it was usually called until the 18th century, from Moscow, its ancient capital. The origin of the term "Russia" has been much disputed. It is certainly derived, through Rossija, from Slavonic Rus or Ros (Byzantine Ροῦς or Ρᾶςτο), a name first given to the Scandinavians who founded a principality on the Dnieper in the 11th century; and afterwards extended to the collection of Russian states of which this principality formed the nucleus. The word Rus, in former times wrongly connected with the tribal name Rhoxolani, is more probably derived from Rutoši, a Finnish name for the Swedes, which seems to be a corruption of the Swedish rothsmeen, "rowers" or "seafarers."
I. THE RUSSIAN EMPIRE

The Russian empire stretches over a vast territory in E. Europe and N. Asia, with an area exceeding 8,660,000 sq. m., or one-sixth of the land surface of the globe (one twenty-third of its whole superficies). It is, however, but thinly peopled on the average, including only one-twelfth of the inhabitants of the earth. It is almost entirely confined to the cold and temperate zones; in Novaya Zemlya and the Taimyr peninsula, it projects within the Arctic Circle as far as 77° 6' and 77° 40' N. respectively; while its S. extremities reach 38° 50' in Armenia, 35° on the Afghan frontier, and 42° 30' on the coasts of the Pacific. To the W. it advances as far as 20° 40' E. in Lapland, 17° in Poland, and 20° 42' on the Black Sea; and its E. limit—East Cape on the Bering Strait—is in 191° E.

The White, Barents and Kara Seas of the Arctic bound it on the N., and the northern Pacific—that is, the Seas of Bering, Okhotsk, and Japan—bounds it on the E.

The Baltic, with the Gulf of Bothnia and Finland, limits it on the N.W.; and two sinuous lines of land frontier separate it respectively from Sweden and Norway on the N.W. and from Prussia, Austria, and Rumania on the W. On the S. and E. the frontier has changed frequently according to the expansion and contraction of the empire under the pressure of political exigency and expediency.

The Black Sea is the principal demarcating feature on the S. of European Russia. On the W. side of that sea the S. frontier touches the Danube for some 120 m.; on the E. side of the same sea it zigzags from the Black Sea to the Caspian, utilizing the river Aras (Araxes) for part of the distance. As the Caspian is virtually a Russian sea, Persia may be said to form the next link in the S. boundary of the Russian empire, followed by Afghanistan. On the Pamirs Russia has since 1855 been conterminous with British India (Kashmir); but the boundary then swings away N. round Chinese Turkestan and the N. side of Mongolia, and, since 1904—5, it has skirted the N. of Manchuria, being separated from it by the river Amur. As thus traced, the boundary in Central Asia includes the deserts of Bokhara and Khiva, which, though nominally protected states, are to all intents and purposes integral parts of the Russian empire. But it excludes Manchuria, with the Liao-tung peninsula and Port Arthur, upon which Russia only placed her grasp in 1898-99, a grasp which she was compelled by Japan to release after the war of 1904-5.

The total length of the frontier line of the Russian empire by land is 2800 m. in Europe, and nearly 10,000 m. in Asia, and by sea over 11,000 m. in Europe and between 19,000 and 20,000 m. in Asia.

Russia has no oceanic possessions; her islands are all appendages of the mainland to which they belong. Such are Karlo, East Kvarken, the Aldan archipelago, Dagu, and Osel or Oesel in the Baltic Sea; Novaya Zemlya, with Kolyguyev and Vaigach, in the Barents Sea; the Solovetsky Islands in the White Sea; the New Siberian archipelago, Wrangel Island, and the land-coast; the Commander Islands off Kamchatka; the Shantar Islands and the N. of Sakhalin in the Sea of Okhotsk. The Aleutian archipelago was sold to the United States in 1867, together with Alaska, and in 1875 the Kurile Islands were ceded to Japan.

If the border regions, that is, two narrow belts, on the N. and S., be left out of account, a striking uniformity of physical feature prevails throughout the whole vast extent of the Russian empire. High plateaus like that of Pamir (the "Roof of the World") and Armenia, and lofty mountain chains like the snow-clad Caucasus, the Alai, the Tian-shan, the Sayan mountains, exist only on the outskirts of the empire.

Viewed broadly, the Russian empire may be said to occupy the territories to the N.W. of the great plateau formation of the old continent—the backbone of Asia—which stretches with decreasing altitude and width from the high tableland of Tibet and Pamir to the lower plateaus of Mongolia, and thence N.E. through the Vitim region to the farthest extremity of Asia. Thus it consists of the immense plains and flat lands which extend between the plateau formation and the Arctic Ocean, including the series of parallel chains and hilly spurs which skirt the former region on the N.W. And it is only to the E. of Lake Baikal that it climbs up on to the plateau, from which it descends again before it reaches the Pacific.

This plateau formation—the oldest geological oontinent of Asia—has been subject to aggradation, and for the most part to permanent settling, while its oceanic slopes have from the dawn of history been occupied by a relatively dense population, long prevented Slav colonization from reaching the Pacific. The Russians can claim it as the largest of any country. The race of N. part, and thus the Pacific on the foggy and frozen shores of the Sea of Okhotsk; but two centuries elapsed ere, after colonizing the depressions around Lake Baikal, they crossed over the plateau to the Okhmas, Vitim and Aldan all arranged en echelon—the former from N.W. to S.E., and the others from S.W. to N.E.—all these belong to the same alpine belt that borders the plateau from end to end of the series.

The fact that regions which extend from the base of the Alpine foothills to the shores of the Arctic Ocean, assume the character either of dry deserts, as in the Aral-Caspian depression, or of low tablelands, as in central Russia and E. Siberia, of high tablelands, as in central Siberia; or of alpine plateaux, as in the Caucasus, is due to the same cause; that is, the noble alpine belt skirts the plateau formation throughout its entire length on the N. and N.W., forming an intermedium between the plateau and the plains. The Caucasus, the Elburz, the Karag-dagh and Caspian sea, formed by the plateau and mountains, is the network of mountains W. of the Pamir, the Tian-shan and the Ala-ta mountain regions, and farther N.E., the Altai, the still unnamed complex of the Minusinsk Mountains, the intricate mountain-chains of Sayan, with those of the Ostan and Tunguzka, which, belonging from N.W. to S.E., and the others from S.W. to N.E.—all these belong to the same alpine belt that borders the plateau from end to end of the series.

Geology.  

The most striking feature in the geology of Russia is its
remarkable freedom from disturbances, either in the form of mountain folding or of igneous intrusions. Over the greater part of the country the strata are still nearly as flat as when they were first laid down, and the deposits, even of the Cambrian period, are as soft as those of the Mesozoic and Tertiary formations in England. Only in the Urals, the Caucasus, the Timan Mountains, the region of the Donets coalfield, and the Kiecle Hills is there any sign of the great folding from which nearly the whole of the rest of Europe has suffered at one time or another.

In the early part of the Paleozoic era only the gneissic region of Finland and Olonets and probably the Archean mass of S. Russia remained constantly above the sea; but there were several oscillations. Gradually, however, the sea retreated from W. Russia and in the Upper Carboniferous and Permian periods it was confined to the E.

At the beginning of the Mesozoic era the whole country became land, bearing upon its surface the salt lakes in which the Trias was laid down. During the Jurassic period the sea again invaded the region, both from the N. and from the S., but still the W. of Russia rose above the waves. In the Cretaceous period the waters withdrew from the N.E., but in the S. they spread W., covering the whole of Poland and finally uniting with the ocean which the chalk of W. Europe was deposited. The Tertiary era was marked by a gradual extension S. of the N. land-mass. In the later stages arms of the sea were cut off and were converted at first into lagoons and then into brackish or fresh-water lakes which continued to occupy much of S. Russia until the beginning of the Quaternary period.

During the first part of the Glacial period Russia seems to have been covered by an immense ice-sheet, which extended also over central Germany, and of which the E. limits cannot yet be determined.

The Archean rocks have a broad extension in Finland, N. Russia, the Ural Mountains and the Caucasus. In S. Russia they form the floor upon which the layers of Tertiary beds, and they are exposed to view in the valleys of the Dnieper and the Bug. They consist for the most part of red gneisses and granulites, with subordinate layers of granite and gneissite. The Finland red-gneiss, the Serdobra marble, and the Pargas and Rustiala marble (with the so-called Eoconanadensis) yield good building stone; while iron, copper and zinc ore are common in Finland and in the Urals. Rocks regarded as representing the Huronian system appear also in Finland, in N.W. Russia, as a narrow strip on the Urals, and in the Dnieper ridge. They consist of a series of unfoliaceous crystalline slates.

The Cambrian is represented by blue clays, unguite sandstones and bituminous slates in Estonia and St. Petersburg. The Ordovician and Silurian formations are only developed, and it is most probable that, with the exception of the Archean formations mentioned above, the region of Russia was covered by the sea. Deposits are concealed, however, by more recent deposits, the deposits appear on the surface only in N.W. Russia (Esthonia, Livonia, St. Petersburg and on the Volkhov), where all the subdivisions of the system have been found, and in the Middle and Lower Devonian series of W. Europe, represented in Poland and in the Urals, is missing in N.W. and central Russia, where only the Middle and Lower Devonian series are present.

Carboniferous deposits occur over nearly the whole of E. Russia, their W. boundary being a line drawn from Archangel to the upper Dnieper, thence to the upper Don, and S. to the mouth of the lower Vitus, with a long narrow Gulf extending W. to encircle the eastern extremity of the Ural Mountains, and thence on the W. borders of this region, being covered towards the E. by thick Permian and Triassic strata. Russia has three large coal-bearing regions—the Moscow basin, the Donets region and the Urals. The Moscow and the Volga valley have nearly a few more coal. In the Moscow basin, which was a broad gul, some of the Carboniferous sea, coal appears as isolated inconstant seams amidst littoral deposits, the formation of which was favoured by frequent submarine deposits of the seas. The coal is here in the lower division of the system; the Upper Carboniferous (corresponding with the English Coal-Measures) is exclusively marine, consisting chiefly of Fusulina limestone. The Donets Coal-Measures, generally, however, the principal coal seams occur in the Upper Carboniferous, and in the Permian rocks, the Lower Carboniferous marine deposits, with, however, the first bed of coal near its summit. Several smaller coalfields on the slopes of the Urals and on the Timan ridge may be added to the above. The Polish coalfields belong to another Carboniferous area of deposit, which extended over Silesia.

The Permian limestones and marls occupy a strip in E. Russia of much less extent than that assigned to them by Murchison. The variegated marls of E. Russia, rich in salt-springs, but very poor in fossils, are supposed by Russian geologists to be Triassic. The Permian contains marine shells and also remains of plants similar to those of England and Germany. But the most prominent deposits are the Coal-Measures, or those of the South, West, and North of Russia, viz., the N. of the Don, the south of the Donets basin, and those of the N. of the Donets basin, and those of the Urals, which are the richest in deposits with the transition of the Productus limestone of the Central Asian mountain belt.

During the Jurassic period the sea began again to invade Russia from S.E. and N.W. The limits of the Russian Jurassic system may be represented by a line drawn from the volcanoes of the Sukhona and Vyychegda to that of the upper Volga, and thence to Kieff, with a wide gul penetrating towards the N.W. In this space three depressions, all running S.W. to N.E., are filled up by Jurassic strata. In the lower part of the N. there are the higher parts of this region, and appear but as isolated islands in central Russia. In the S.E. all the older subdivisions are represented, the deposits having the characters of a deep-sea formation in these parts. The Carboniferous rocks are only widely developed and of value in the region of the Produktus limestone of the Ural Mountains.
level of the Miocene sea, which was very shallow to the N. of this last ridge, while farther S. it was connected both with the Vienna basin and with the Aral-Caspian. The Pliocene appears only in the coast region of the Black and Azov Seas, but it is widely developed in the Aral-Caspian region, where, however, the Ust-Urt and the Obshchii Syrty rose above the sea.

The thick Quaternary, or Post-Pliocene, deposits which nearly all Russia were for a long time a puzzle to geologists. They consisted of alluvial sediments in the N. and of loess in the S. The former presents an intimate mixture of boulders brought from Finland and Olonets (with an addition of local boulders) with small gravel, coarse sand and the finest glacial mud,—the whole bearing no trace of ever having been washed up and sorted by water in motion. These glacial sediments are of late and early Pleistocene age; the size of the boulders decreases on the whole from N. to S., and the boulder clay, especially in N. and central Russia, often takes the shape of ridges parallel to the direction of the motion of the boulder clay. Russia is thus furnished with corresponding deposits established by Murdhis, but not yet settled in the S.E. and E., are, according to N. Nikitin, the following:—from the S. frontier of Poland to Ovruch, Umán, Kamychen, Poltava and Razdornaya (50° N. latitude), with a curve N. to Konelék (?); thence due N. to Vetluga (58° N. latitude), E. to Glazova in Vyatka, and from this towards the N. and W. along the watershed of the Volga and Pechora (?). S. of the 50th parallel appears the loess, where its usual characters (lack of fossils, want of stratification, &c.), showing a remarkable uniformity in composition over very large surfaces; it covers both watersheds and valleys, but chiefly the former. Such being the characters of the Quaternary deposits in Russia, the majority of Russian geologists now adopt the concept that Russian boulder clay was formed as far as the move limit, with an immense ice-sheet which crept over central Russia and central Germany from Scandinavia and N. Russia. Another ice-carrying was probably advancing at the same time from the N.E., that the Urals, but the question of the glaciation of the Urals remains still open. As to the loess, the usual view is that it was a steppe-deposit due to the drifting of fine sand and dust during a dry episode in the Pleistocene period.

A great part of the Post-Glacial period is represented throughout Russia, Poland and Finland, as also throughout Siberia and Central Asia, by very thick lacustrine deposits, which show that, after the melting of the ice-sheet, the country was covered with immeasurable channels by bogs and lakes (the lakes of the S.), which later on gave rise to the actual rivers. On the outskirts of the lacustrine region, traces of marine deposits, not higher than 200 or perhaps even 150 ft. above present sea-level, are found alike on the Arctic Sea and on the Baltic and Black Sea coasts, water-gaps of the Arctic Sea advance which up the Dvina; and the Caspian, connected by the Manych with the Black Sea, and by the Uzboy valley with Lake Aral, penetrated N. up the Volga valley, as far as its Samara bend. Unmistakeable traces of this, while during the Glacial period Russia had an arctic flora and fauna, the climate of the Lacustrine period was more genial than it is now, and a dense human population at that time peopled the shores of the numberless lakes.

The lacustrine period has not yet revealed itself close in Russia. Finland and the N.W. lilly plateaus are still in the same geological phase, and are dotted with numberless lakes and ponds, while the rivers continue to dig out their yet undetermined channels. But the great lakes which covered the country during the Lacustrine period have disappeared, leaving behind them immense marshes like those of the Priepet and in the N.E. The disappearance of what still remains of them is accelerated not only by the general decrease of moisture, but also primarily by the gradual upheaval of N. Russia. This is shown from Esthonia and Finland to the Kola peninsula and Novaya Zemlya, at an average rate of about 1.8 feet per century. This upheaval—the consequences of which have been felt even within the historic period, by the drainage of the lakes of Novgorod and at the head of the Gulf of Finland—together with the destruction of forests (which must be considered, however, as a subordinate cause), contribute towards a decrease of precipitation over Russia and the Black Sea, and the small river valleys, at the same time, as the gradients are gradually increasing on account of the upheaval of the continent, the rivers dig their channels deeper and deeper. Consequently central and especially S. Russia witness the gradual causing of ravines, or the widening of existing ravines), the summits of which rapidly advance and ramify on the loose surface deposits. As for the S. steppes, their desiccation, the consequence of the above causes, is in rapid progress.

Population.—The population of the empire, which was estimated at 74,000,000 in 1859, was found to be over 129,200,000 at the census of 1897, taken over all the empire except Finland. In 1900 it was estimated to be 143,000,000, and in 1906, according to a detailed estimate of the Central Statistical Committee, it was 149,200,000. Thus from 1860 to 1897 the population increased 74.9% and from 1897 to 1904 26.3%, an average annual increase of about 3.6% as compared with an average annual increase of 2.4% during the period 1860-97. The increase took place chiefly in the large cities, in Siberia, Poland, Lithuania, S. Russia and Caucasus. The official divisions of the empire are given here, and details are given in separate articles.

Amur Region—

| Amur | Maritime Province | Sakhalin |

It has been found, from a comparison of the densities of the population of the various provinces in 1859 with the distribution in 1897, that the centre of density has distinctly moved S., towards the shores of the Black and W. and, consequently the greatest increase having taken place in the E. Polish and in the Lithuanian provinces, along the S.W. border, in the prairie belt beside the Black Sea, and in Orenburg. N. Caucasus and S.W. Siberia likewise show a considerable increase. The census of 1897 revealed in several provinces a remarkably low proportion of men to women. This was owing to the fact that large numbers of the men engaged in agricultural pursuits during the summer temporarily move every year into the large industrial centres for the winter. Consequently there were only 87.4 and 89.8 women to every 100 men in the governmental areas of St Petersburg and Taurida respectively, but as many as 138.8 in Yaroslav, 119 in Tver and 117 in Kostroma. The average number of women to every 100 men in the Russian governments proper was 102.9: in Finland, 102.7; in Caucasus, 88.9; in Siberia, 93.7; and in Turkestan and Transcaspia, 83.0.

1 Bibliography: Memoirs, Izvestia and Geological Maps of the Commissariat of the Geological Survey; Memoirs and Sborniks of the Mineralogical Society, of the Academy of Science and of the Societies of Naturalists at the Universities; Mining Journal; Murdhis's Geology of Russia; Helmersen's and Möller's Geological Map of Russia and the Urals; Inostrantsev in Appendix to Russian translation of Reclus's Geographic Unit., and Manual of Geology (Russian).
The effects of emigration and immigration cannot be estimated with accuracy, because only those who cross the frontier with passports are taken account of. The statistics of these show that there was during the thirty-two years, 1856-88, an excess of emigration over immigration of 1,204,717 foreigners. On the other hand, in the six years, 1892-97, the excess of Russian emigration over immigration was 297,333, as compared with an excess of foreign immigration over Russian emigration of 204,261. Since October 1900, to the 1st January, 1901, the total emigrants from Russia numbered 2,358,539, of whom 1,144,246 were Russians; while the immigrants numbered 2,333,053, of whom 1,432,057 were foreigners. It is also known that the number of Russian immigrants into the United States in 1891-1902 was 745,890, as compared with 315,420 in 1873-90, or a grand total since 1873 of 1,056,538. By far the greater part of these were Jews. The emigration to Siberia varies much from year to year. It was 26,129 in 1888, and 60,000 in 1898. During the two following years, it amounted to an average of over 160,000, but in the years 1901-3 it averaged less than 84,638 per annum. Altogether some 800,000 peasants are estimated to have settled in Siberia during the years 1886-96, but during the years 1893-1905 no less than four millions in all. There is also some emigration from Russia to the S. Urals, as well as to some of the steppe governments.

Within the empire a very great diversity of nationalities is comprised, due to the amalgamation or absorption by the Slav race of a variety of Ural-Altai stocks, of Turk-Tatars, Turko-Mongols and various Caucasian races. In some cases their ethnical relations have not yet been completely determined. According to the results obtained by the census committees of 1897, working on a linguistic basis, the principal peoples of the empire are Russian, Ukrainian, Astrakhan, Tula and Tishiniev. In other parts of the empire there were four cities each having over 100,000 inhabitants in that year, namely, Baku, Tiflis, Tashkent and Helsingfors. While only three of the above cities are in middle Russia (Moscow, Tula and Riazan), the fourth is in S. Russia. There are thirty-four cities in European Russia and Poland, and forty in the entire empire, with from 50,000 to 100,000 inhabitants each. The rural population live for the most part in villages, not as a rule scattered about the country. In the indented regions of the N. and in the N. parts of the forest zone the villages are very small. They are larger, but still small, in White Russia, Lithuania and the region of the lakes; but in the steppe governments they are very appreciably bigger, some of the Cossack stanitsas or settlements exceeding 30,000 and many of them numbering more than 10,000 inhabitants each. The houses are generally built of wood and wear a poverty-stricken aspect. Owing to the great risks from fire the villages usually cover a large area of ground, and the houses are often built on防止 fire spreading. While in many places, the great that during the last ten years of the 19th century, in a very great number of cities, the deaths exceeded the births by 1 to 4 in the thousand.

There were in European Russia and Poland only twelve cities with more than 100,000 inhabitants in 1884; in 1900 there were sixteen, namely, St. Petersburg, Moscow, Warsaw, Odessa, Lodz, Kiev, Kharkov, Kherson, Astrakhan, Kherson, Tshatka, Kehing, Tishiniev, Astrakhan, Tula and Kishinev. In other parts of the empire there were four cities each having over 100,000 inhabitants in that year, namely, Baku, Tiflis, Tashkent and Helsingfors. While only three of the above cities are in middle Russia (Moscow, Tula and Riazan), the fourth is in S. Russia. There are thirty-four cities in European Russia and Poland, and forty in the entire empire, with from 50,000 to 100,000 inhabitants each. The rural population live for the most part in villages, not as a rule scattered about the country. In the indented regions of the N. and in the N. parts of the forest zone the villages are very small. They are larger, but still small, in White Russia, Lithuania and the region of the lakes; but in the steppe governments they are very appreciably bigger, some of the Cossack stanitsas or settlements exceeding 30,000 and many of them numbering more than 10,000 inhabitants each. The houses are generally built of wood and wear a poverty-stricken aspect. Owing to the great risks from fire the villages usually cover a large area of ground, and the houses are often built on防止 fire spreading. While in many places, the great that during the last ten years of the 19th century, in a very great number of cities, the deaths exceeded the births by 1 to 4 in the thousand.

A. Altioff, Peuples et langues de la Russie (Paris, 1906), based on the report of the Russian Census Committee of 1897.

on the 27th of April 1906, while the name and principle of autocracy was jealously preserved, the word "unlimited" vanished. Not that the régime in Russia had become in any true sense constitutional, far less parliamentary; but the "unlimited autocracy" had given place to a "self-liquidated autocracy," whether permanently so limited, or only at the discretion of the autocrat, remaining a subject of heated controversy between conflicting parties in the state. Provisionally, then, the Russian governmental system may perhaps be best defined—as M. Charles suggests—as "a limited monarchy under an autocratic emperor."

At the head of the government is the emperor, whose power is limited only by the provisions of the fundamental laws of the empire. Of these some are ancient and undisputed: the empire may not be partitioned, but descends entire in order of primogeniture, and by preference to the male heir; the emperor and his consort must belong to the Eastern Orthodox Church; the emperor can wear no crown that entails residence abroad. By the manifesto of the 17th October 1905 the emperor voluntarily limited his legislative power by decreeing that no measure was to become law without the unanimous votes of the Imperial Duma, a freely elected national assembly. By the law of the 27th February 1906 the Council of the Empire was associated with the Duma as a legislative Upper House; and from this time the legislative power has been exercised normally by the emperor only in concert with the two chambers.

The Council of the Empire, or Imperial Council (Gosudarstvenny Sovet), as reconstituted for this purpose, consists of 196 members, of whom 98 are nominated by the emperor, while 98 are elective. The ministers, also nominated, are ex officio members. Of the elected members 3 are returned by the "black" clergy (the monks), 3 by the "white" clergy (seculars), 18 by the corporations of nobles, 6 by the academy of sciences and the universities, 6 by the chambers of commerce, 6 by the industrial councils, 34 by the governments having semestros, 16 by those having no semestros, and 6 by Poland. As a legislative body the powers of the Council are co-ordinate with those of the Duma; in practice, however, it has seldom if ever initiated legislation.

The Duma of the Empire or Imperial Duma (Gosudarstvennyy Duma), which forms the lower House of the Russian parliament, consists (since the ukas of the 2nd of June 1907) of 442 members, elected by an exceedingly complicated process, so manipulated as to secure an overwhelming preponderance for the wealthy, and especially the landed classes, and also for the representatives of the Russian as opposed to the subject peoples. Each province of the empire, except the now disfranchised steps of Central Asia, returns a certain proportion of members (fixed in each case by law in such a way as to give a preponderance to the Russian element), in addition to those returned by certain of

M. Stolygin defended the ukas of the 2nd of June 1907, which flat contradiction of the provisions of the fundamental laws altered the electoral law without the consent of the legislature, on the ground that what the autocrat had granted the autocrat could take away. The members of the Opposition, on the other hand, quoting Art. 84 of the fundamental laws ("the emperor is governed on the principles of laws issued according to the established order"), argued that the emperor himself could only act within the limits of the order established by those laws. It is noteworthy that even the third Duma in its address to the throne, if it avoided the tabooed word "Constitution," avoided all mention of autocracy.

1 Le Parlement russe, p. 151.
2 Imperator is the official style. The Russian translation is "Tsar." Popularly, however, the emperor is known by his old Russian title of tsar (государь).
3 This is the first time since Peter the Great that the clergy have been given a voice in secular affairs in Russia.
4 The number of the council was formerly not fixed, and there are still honorary councillors who have no right to sit. Thus in 1910 the honorary president of the council was the grand-duke Michael Nikolaievich, the actual president M. G. Akimov. The judicial and administrative work of the old council was in 1906 assigned to separate committees.
5 These returned 23 members in the first and second Dumas.

1. These totals include in some cases small linguistic groups not mentioned in the table.
2. About 77% Bulgarians, the rest mostly Bohemians (Czechs).
3. Principally Frenchmen, with Englishmen, Italians, Norwegians, Danes, Dutchmen and Spaniards.
4. Ethnologically the Bulgarians ought perhaps to come here; but, as a large admixture of Slav blood flows in their veins and they speak a distinctly Slav language, they have in this table been grouped with the Slavs.
5. Includes Georgians, Mingrelians, Lermonts and Svanetians.
6. For details, see table under the heading Caucasus. Of the total given here, 20% are Circassians.

---

The great cities. The members of the Duma are elected by electoral colleges in each government, and these in their turn are elected, like the semistos (see below), by electoral assemblies chosen by the three classes of landed proprietors, citizens and peasants. In these assemblies the large proprietors sit in person, being thus electors in the second degree; the lesser proprietors are represented by delegates, and therefore elect in the third degree. The urban population, divided into two categories according to their taxable wealth, elects delegates direct to the college of the government (Guberniya), and is thus represented in the second degree; but the system of division into categories, according not to the number of taxpayers but to the amount they pay, gives a great preponderance to the richer classes. The peasants are represented only in the fourth degree, since the delegates to the electoral college are elected by the voivods (see below). The workmen, finally, are specially treated. Every industrial concern employing fifty hands or over elects one or more delegates to the electoral
Further, the emperor has the power to issue ordinances having the force of law, i.e., under extraordinary circumstances when the Duma is not sitting. These ordinances must, however, be of a temporary nature, must not infringe the fundamental laws or statutes passed by the two chambers, or change the electoral system, and must be laid upon the table of the Duma at the first opportunity. Since, however, the emperor has the power of proroguing or dissolving the Duma as often as he pleases, it is clear that these temporary ordinances might in effect be made permanent. Finally, the emperor has the right to proclaim anywhere and at any time a state of siege.

In this way the fundamental laws were suspended not only in Poland but in St Petersburg and other parts of the empire during the greater part of the four years succeeding the grant of the constitution.

It should be noted, none the less, that the third Duma succeeded in establishing its position, and that in view of its useful activities even the extreme Right came to realize that there could be no return to the old undistinguished absolutist régime (see History, below, ad fn.).

By the law of the 18th of October (November 1) 1905, to assist the emperor in the supreme administration a Council of Ministers (Soviets Ministerov) was created, under a minister president, the first appearance of a prime minister in Russia. This council consists of all the ministers and of the heads of the principal administrations. Their ministrations are divided into five main divisions: (1) the Imperial Court, to which the administration of the sapanes, the chapter of the imperial orders, the imperial palaces and theatres, and the Academy of Fine Arts are subordinated; (2) Foreign Affairs; (3) War and Marine; (4) Finance; (5) Commerce and Industry (created in 1905); (6) Interior (including police, health, censorship and press, posts and telegraphs, foreign religions, statistics); (7) Agriculture; (8) Ways and Communications; (9) Justice; (10) Public Instruction. Dependent on the Council of Ministers are two other councils: the Holy Synod and the Senate.

The Holy Synod (established in 1721) is the supreme organ of government of the Orthodox Church in Russia. It is presided over by a lay procurator, representing the emperor, and consists, for the rest, of the three metropolitanos of Moscow, St Petersburg and Kiev, the archbishop of Georgia, and a number of bishops sitting in rotation.

The Senate (Pravitelstvuyushchi Senat, i.e., directing or governing senate), originally established by Peter the Great, consists of members nominated by the emperor. Its functions, which are exceedingly various, are carried out by the different departments into which it is divided. It is the supreme court of cassation (see Judicial System, below); an audit office, a high court of justice for all political offences; one of its departments fulfils the functions of a heralds' college. It also has supreme jurisdiction in all disputes arising out of the administration of the empire, notably differences between the representatives of the central power and the elected organs of local self-government. Lastly, it examines into registers and promulgates new laws, a function which, in theory, gives it a power, akin to that of the Supreme Court of the United States, of rejecting measures not in accordance with the fundamental laws.

For purposes of provincial administration Russia is divided into 78 governments (guberniye), 18 provinces (oblast) and 1 district (okrug). Of these 11 governments, 17 provinces and 1 district (Sakhalin) belong to Asiatic Russia. Of the rest 8 governments are in Finland, 10 in Poland. European Russia thus embraces 59 governments and 1 province (that of the Don). The Don province is under the direct jurisdiction of the ministry of war; the rest have each a governor and deputy-governor, the latter presiding over the administrative council. In addition there are governors-general, generally placed over several governments and armed with more extensive powers,

In the Duma itself the voting—secret and by ballot throughout—is by majority; and since this majority consists, under the actual system, of very conservative elements (the landowners and urban delegates having 3/5th of the votes), the progressive elements—however much they might preponderate in the country—would have no chance of representation at all save for the curious provision that one member at least in each government must be chosen from each of the five classes represented in the college. For example, were there no reactionary peasant among the delegates, a reactionary majority might be forced to return a Social Democrat to the Duma. As it is, though a fixed minimum of peasant delegates must be returned, they by no means probably represent the opinion of the peasantry. That in the Duma any Radical elements survive at all is mainly due to the peculiar franchize enjoyed by the seven largest towns—St Petersburg, Moscow, Kiew, Odessa, Riga and the Polish cities of Warsaw and Lodz. These elect their delegates to the Duma direct, and though their votes are divided into two curias (on the basis of taxable property) in such a way as to give the advantage to wealth, each returning the same number of delegates, the democratic colleges can at least return members of their own complexion. The competence of the Russian parliament thus constituted is strictly limited. It shares with the emperor the legislative power, including the power of sanctioning the budget. But so far as the parliament is concerned, this power is subject to numerous and important exceptions. All measures, e.g., dealing with the organization of the army and navy are outside its competence; these are no longer called "laws" but "ordinary administrative rules." Moreover, the procedure of the Houses practically places the control of legislation in the hands of ministers. Any member may bring in a "project of law," but it has to be submitted to the minister of the department concerned, who is allowed a month to consider it, and himself prepares the final draft laid on the table of the House. Amendments, however, may be and have been carried against the government. Ministers are responsible, moreover, not to parliament but to the emperor. They may be interpellated, but only on the legality, not the policy, of their acts. In the words of M. Stolypin, there is no intention of converting the ministerial bench into a prisoners' dock. If by a two-thirds majority the action of a minister be arraigned, the president of the Imperial Council lays the case before the emperor, who decides. The powers of the parliament over the budget are even more limited, though not altogether illusory. No legislation by means of the budget is admissible; no alteration may be made in credits necessary for carrying out a law. This deprives parliament of control over the administrative departments, all the ministries being thus "armour-plated"—to use the cant phrase current in Russia—except that of ways and communications (railways). The sum of 700,000,000 roubles per annum is thus excepted from the control of the chambers. Other exceptions are the "Institutions of the Empress Marie," which absorb, inter alia, the duties on playing-cards and the taxes on places of public entertainment; the imperial civil list, so far as this does not exceed the sum fixed in 1906 (16,355,595 roubles); the expenses of the two imperial chanceries, 10,000,000 roubles per annum, which constitute in effect a secret service fund. Altogether, half the annual expenditure of the country is outside the control of parliament. Nor is this all. If the budget be not sanctioned by the emperor, that of the previous year remains in force, and the government has power, motu proprio, to impose the extra taxes necessary to carry out new laws. In certain circumstances, too, the emperor reserves the right to raise fresh loans.

1 Thus M. Guchkov, leader of the Octobrists, and M. Milliukov, leader of the case, were both returned by the second curia of St Petersburg to the third Duma.

2 Strictly speaking, the title is inapplicable, there being no collective official name for the two chambers. The word parliament may, however, be used as a convenient term, failing a better.
usually including the command of the troops within the limits of their jurisdiction. In 1906 there were governors-general in Finland, Warsaw, Vila, Kiev, Moscow and Riga. The larger cities (St Petersburg, Moscow, Odessa, Sevastopol, Kertch-Yenikala, Nikolayev, Rostov) have an administrative system of their own, independent of the governments; in these the chief of police acts as governor. As organs of the central government there are further, the ispravnikii, chiefs of police in the districts into which the governments are divided. These are nominated by the governors, and have under their orders in the principal localities commissaries (stanovoi pristav). Ispravnikii and stanovoi alike are armed with large and ill-defined powers; and, since they are for the most part illiterate and wholly ignorant of the law, they have proved exasperating engines of oppression. Towards the end of the reign of Alexander II., the government, in order to preserve order in the country districts, also created a special class of mounted rural policemen (uryadniki, from uriad, order), who, armed with power to arrest all suspects on the spot, rapidly became the terror of the countryside. Finally, in the towns, every resident with a directive policeman in the person of the porter (dvornik), who is charged with the duty of reporting to the police the presence of any suspicious characters or anything else that may interest them.

In addition to the above there is also a police organization, in direct subordination to the ministry of the interior, of which the principal function is the discovery, prevention and extirpation of political sedition. A secret police, armed with inquisitorial and arbitrary powers, has always existed in autocratic Russia. Its most famous development was the so-called "Third Section" (of the imperial chancery) instituted by the emperor Nicholas I. in 1856. This was entirely independent of the ordinary police, but was associated with the previously existing corps of gendarmes (Korpus Zhandarmov), whose chief was placed at its head. Its object had originally been to keep the emperor in close touch with all the branches of the administration and to bring to his notice any abuses and irregularities (see Nicholas I.), and for this purpose its chief was in constant personal intercourse with the sovereign. Actually, however, its activity, directed mainly to the discovery of political offences, degenerated into a hideous reign of terror. Its organization was spread all over Russia; its procedure was secret and summary (transportation by administrative order); and, its instruments being for the most part ignorant and largely corrupt, its victims were counted by thousands.

The "Third Section" was suppressed by Alexander II. in 1880, but only in name. In fact it was transformed into a separate department of the ministry of the interior, and, provided with an enormous secret service fund, soon dominated the whole ministry. The corps of gendarmes was also incorporated in this department, the under-secretary of the interior being placed at its head and at that of the police generally, with practically unlimited jurisdiction in all cases which, in the judgment of the minister of the interior, required to be dealt with by processes outside the ordinary law. In 1866 the power of the minister to remove the whole or any part of the forces of the police (volosts) was extended at the expense of those of the under-secretary, who remained only at the head of the corps of gendarmes; but by a law of the 24th of September 1904 this was again reversed, and the under-secretary was again placed at the head of all the police with the title of under-secretary for the administration of the police.

Local Elected Administrative Bodies.—Alongside the local organs of the central government in Russia there are three classes of local elected bodies charged with administrative functions: (1) the peasant assemblies in the mir and the volost;

1 From Catherine II.'s time to that of Alexander II. they were elected by the nobles. This was changed in consequence of the emancipation of the serfs.
2 They were soon nicknamed Kuryadniki, chicken-stealers (from Kura, hen). See Leroy-Beaulieu, L'Empire des taars, ii. 134.
3 The dvornik is on duty for sixteen hours at a stretch, during which he is not allowed to sleep or even to shelter in the porch.

(2) the semstvos in the 34 governments of Russia proper, (3) the municipal domas. Of these the peasant assemblies are the most interesting and in some respects the most important, since the peasants (i.e. three-quarters of the population of Russia) form a class apart, largely excepted from the incidence of the ordinary law, and governed in accordance with their local customs. The mir itself, with its customs, is of immemorial antiquity (see Village Communities); it was not, however, till the emancipation of the serfs in 1861 that the village community was withdrawn from the patrimonial jurisdiction of the landowning nobility and endowed with self-government. The assembly of the mir consists of all the peasant householders of the village. These elect a head-man (starosta) and a collector of taxes, who was responsible, at least until the ukas of October 1906, which abolished communal responsibility for the payment of taxes, for the repartition among individuals of the taxes imposed on the commune. A number of mirs are united into a volost, or canton, which has an assembly consisting of elected delegates from the mirs. These elect an elder (starshina) and a secretary, who was also known as a dvornik, or judge (volostnyi sud). See Judicial System, below. The self-government of the mirs and volosts is, however, tempered by the authority of the police commissaries (stanovoi) and by the power of general oversight given to the nominated "district committees for the affairs of the peasants."

The system of local self-government is continued, so far as the 34 governments of old Russia are concerned, in the elective district and provincial assemblies (semstvos).

These bodies, one for each district and another for each province or government, were created by Alexander II. in 1864. They consist of a representative council (zemskoye sobranye) and of an executive board (zemskoye upravo) nominated by the former. The board consists of five classes of members: (1) large landed proprietors (nobles owning 390 acres and over), who sit in person; (2) delegates of the small landowners, including the clergy in their capacity of landed proprietors; (3) delegates of the wealthier townsmen; (4) delegates of the less wealthy urban classes; (5) delegates of the peasants, elected by the volosts. The rules governing elections to the semstvos were taken as a model for the electoral law of 1906 and are sufficiently indicated by the account of this given below. The semstvos were originally given large powers in relation to the incidence of taxation, and such questions as education, public health, roads and the like. These powers were, however, severely restricted by the emperor Alexander III. (law of 12/25 June 1890), the semstvos being absolutely subordinated to the governors, whose consent was necessary to the validity of all their decisions, and who received drastic powers of discipline over the members. It was not till 1905 that the semstvos regained, at least de facto, some of their independent initiative. The part played by the congress of semstvos in the earlier stages of the Russian revolution is outlined below (see History: § 2. Development of the Russian Constitution).

4 Until the ukas of October 18, 1906, the peasant class was stereotyped under the electoral law. No peasant, however rich, could qualify for a vote in any but the peasants' electoral colleges. In 1866 the power of the minister to extend the franchise to any of the peasants who were allowed to vote as landowners. At the same time the Senate interpreted the law so as to exclude all but heads of families actually engaged in farming from the vote for the Duma.

5 None but peasants—not even the noble-landowner—has a voice in the assembly of the mir.

6 Sixteen provinces have no semstvos, i.e. the three Baltic provinces, the nine western governments annexed from Poland by Catherine II., and the Cossack provinces of the Don, Astrakhan, Orenburg and Stavropol.

7 By the law of the 12th (25th) of June 1890 the peasant members of the semstvos were to be nominated by the governor of the government province (rostochnik). The title of semstvo was withdrawn.

8 In spite of these restrictions and of an electoral system which tended to make these assemblies as strait-laced and reactionary as any government bureau, the semstvos did good work, notably educational, in those provinces where the proprietors were inspired with a more liberal spirit. Many semstvos also made extensive and valuable inquiries into the condition of agriculture, industry and the like.
JUDICIAL SYSTEM

RUSSIA

Since 1876 the municipalities in European Russia have had institutions like those of the senemtos. All owners of houses, and tax-paying merchants, artisans and workmen are enrolled on lists in a descending order according to their assessed wealth. The total valuation is then divided into three equal parts, representing three groups of voters very unequal in number, each of which elects an equal number of delegates to the municipal dumas. The executive is in the hands of an elective mayor and an uprava, which consists of several members elected by the dumas. Under Alexander III., however, by laws promulgated in 1892 and 1894, the municipal dumas were subordinated to the governors in the same way as the senemtos. In 1894 municipal institutions, with still more restricted powers, were granted to several towns in Siberia, and in 1895 to some in Caucasus.

In the Baltic provinces (Courland, Livonia and Estonia) the landowning classes formerly enjoyed considerable powers of self-government and numerous privileges in matters affecting education, police and the administration of local justice. But by laws promulgated in 1888 and 1889 the rights of police and manorial justice were transferred from the landlords to officials of the central government. Since about the same time a process of rigorous Russification has been carried through in the same provinces, in all departments of administration, in the higher schools and in the university of Dorpat, the name of which was altered to Yuriev. In 1893 district committees for the management of the peasants' affairs, similar to those in the purely Russian governments, were introduced into this part of the empire.

Judicial System.—Not the least valuable of the gifts of the "tsar emancipator," Alexander II., to Russia was the judicial system established by the statute (Sudebnii Ustav) of the 20th of November 1864. The system which this superseded was not indigenous to Russia, but had been set up by Peter the Great, who had taken as his model the inquisitorial procedure at that time in vogue on the continent of western Europe. Both civil and criminal procedure were secret. All the proceedings were conducted in writing, and the judges were not confronted with either the parties or the witnesses until they emerged to deliver judgment. This secrecy, combined with the fact that the judges were very ill paid, led to universal bribery and corruption. To check this courts were multiplied (there were five, six or more instances), which only multiplied the evil. Documents accumulated from court to court, till none but the clerks who had written them could tell their gist; costs were piled up; and all this, combined with the confusion caused by the chaotic mass of imperial ukazes, ordinances and ancient laws—often inconsistent or flatly contradictory—made the administration of justice, if possible, more dilatory and capricious than in the old, unreformed English court of chancery. Above all, there was no dividing line between the judiciary and the administrative functions. The judges were not so by profession; they were merely members of the official class (chinovniki), the prelates and vices of which they shared. Of this system—except so far as the confusion of the laws is concerned—the reform of 1864 made a clean sweep. The new system established—based partly on English, partly on French models—was built up on certain broad principles: the separation of the judicial and administrative functions, the independence of the judges and courts, the publicity of trials and oral procedure, the equality of all classes before the law. Moreover, a democratic element was introduced by the adoption of the jury system and—so far as one order of tribunal was concerned—the election of judges. The establishment of a judicial system on these principles constituted, as M. Leroy-Beaulieu justly observes, a fundamental change in the conception of the Russian state, which, by placing the administration of justice outside the sphere of the executive power, ceased to be a despotism. This fact made the new system especially obnoxious to the bureaucracy, and during the latter years of Alexander II. and the reign of Alexander III. there was a piecemeal taking back of what had been given. It was reserved for the third Duma, after the revolution, to begin the reversal of this process.1

The system established by the law of 1864 is remarkable in that it set up two wholly separate orders of tribunals, each having their own courts of appeal and coming in contact only in the senate, as the supreme court of cassation. The first of these, based on the English model, are the courts of the elected justices of the peace, with jurisdiction over petty causes, whether civil or criminal; the second, based on the French model, are the ordinary tribunals of nominated judges, sitting with or without a jury to hear important cases.

The justices of the peace, who must be landowners2 or (in towns) persons of moderate property, are elected by the municipal dumas in the towns, and by the senemtos in the country districts, for a term of three years. They are of two classes: (1) acting justices (uchastkovey miryove suudi); (2) honorary justices (pochetnye miryoe suedi). The acting justice sits normally alone to hear causes in his canton (uchastok), unless he is put on trial (usually by both parties to a suit, he may call in an honorary justice as assessor or substitute).3 In all civil cases involving less than 30 roubles, and in criminal cases punishable by no more than three days' arrest, his judgment is final. In other cases appeal may be made to the "assize of the peace" (miryoye syezd), consisting of three or more justices of the peace meeting monthly (cf. the English quarter sessions), which acts both as a court of appeal and of cassation. From this again appeal can be made on points of law or disputed procedure to the senate, which may send the case back for retrial by an assize of the peace in another district.

The ordinary tribunals, in their organization, personnel and procedure, are modelled very closely on those of France (see France, Law and Institutions). From the town judge (ispravnik), who, in spite of the principle laid down in 1864, combines judicial and administrative functions, an appeal lies (as in the case of the justices of the peace) to an assembly of such judges; from these again there is an appeal to the district court (sbrugnyi suzdols, consisting of three judges);4 from this to the court of appeal (sudebniy palata); while over this again is the senate, which, as the supreme court of cassation, can send a case for retrial for reason shown. The district court, sitting with a jury, can try criminal cases without appeal, but only by special leave in each case of the court of appeal. The senate, as supreme court of cassation, has two departments, one for civil and one for criminal cases. As a court of justice its main drawback is that it is wholly unable to cope with the vast mass of documents representing appeals from all parts of the empire.

Two important classes in Russia stood more or less outside the competence of the above systems: the clergy and the peasants. The ecclesiastical courts still retain a jurisdiction over the clergy which they have lost elsewhere in Europe; and in them the old secret written procedure survives. Their interest for the laity lies

1 An ukaa of 1879 gave the governors the right to report secretly the qualifications of candidates for the office of justice of the peace.
2 In 1889 Alexander abolished the election of justices of the peace, except in certain large towns and some outlying parts of the empire, and greatly restricted the right of trial by jury. The confusion of the judicial and administrative functions was abolished again by the appointment of officials as judges.
3 In 1909 the third Duma restored the election of justices of peace.
4 These honorary justices are mainly recruited from the ranks of the higher bureaucracy and the army.

Ecclesiastical courts.

This corresponds to the French cour d'arrondissement, but its jurisdiction is, territorially, much wider, often covering several districts or even a whole government.
RUSSIA

878

mainly in the fact that marriage and divorce fall within their competence; and their reform has been postponed largely because the wealthy and corrupt society of the Russian capital preferred a system which makes divorce easily purchasable and avoids at the same time the scandal of publicity. The case of the peasants is more interesting, and deserves a somewhat more detailed notice.

The peasants, as already stated, form a class apart, untouched by the influence of Western civilization, the principles of which are quite incapable of understanding or appreciating. This fact was recognized by the legislators of 1864, and beneath the statutory tribunals created in that year the special courts of the peasants were suffered to survive. These were indeed but a few years older. Up to 1886, the date of the emancipation, the peasant serfs had been under the patrimonial jurisdiction of their lords. The edict of emancipation abolished this jurisdiction, and set up instead in each volost a court particular to the peasants (volostnye sudov), of which the judges and jury, themselves peasants, were elected by the assembly of the volost (volostniy sход) each year. In these courts the ordinary written law had little to say; the decisions of the volost courts were based on the local customary law, which alone the peasants, and the peasants alone, understand.

The justice administered in them was patriarchal and rough, but not ineffective. All civil cases involving less than 100 roubles value were within their competence, and more important cases by consent of the parties. They acted also as police courts in the case of petty thefts, breaches of the peace and the like. They were also charged with the maintenance of order in the mir and the family, punishing infractions of the religious law, husbands who beat their wives, and parents who ill-treated their children. The penalty of flogging, preferred by the peasants to fine or imprisonment, was not unknown. The judges were, of course, wholly illiterate, and this tended to throw the ultimate power into the hands of the clerk (pisar) of the court, who was rarely above corruption.

In 1880, according to the observations of M. Leroy-Beaulieu, the fines inflicted by the court were commonly paid in vodka, which was consumed on the premises by the judges and the parties to the suit; there is no reason to suppose that this amiable custom has been abandoned.

The peasants are not compelled to go to the volost court. They can apply to the police commissaries (stanovery) or to the justices of the peace; but the great distances to be traversed in a country so sparsely populated makes this course highly inconvenient. On the other hand, from the volost court there is no appeal, unless it has acted ultra vires or illegally. In the latter case a court of cassation is provided in the district committee for the affairs of the peasants (Uyezdnoe po krestianskim dolam pristutstviye), which has superseded the assembly of arbiters of the peace (mirowye posredniki) established in 1866.

Previous to the revolution of 1905 but little progress had been made in Russia as regards education. Disturb of the natural sciences, even of the secondary grades of the higher institutions of all kinds, ideas of free government; desire to make university education, and even secondary education, a privilege of the wealthier classes; neglect of primary education, coupled with some demand for the public instruction of all initiative, private and public, in the matter of disseminating education among the illiterate classes—these were the distinctive features of the educational policy of the last twenty years of the 19th century.

It was only towards its close that a change took place in the attitude of the government towards technical education, and a few high and middle technical schools were opened. It was only then, too, that a reform was started in secondary education, with the object of reviving the so-called classical system favoured in the lyceums since the seventies, the complete failure of which has been demonstrated after nearly thirty years of experiment. Apart from the schools under the ministry of war (Cossack voisko school, &c.) the only other schools at the basis of classical system are either under the ministry of public instruction or of the Holy Synod. Those under the latter body are of recent growth, the policy of the last twenty years of the 19th century having been to hand over the budget allowances for primary instruction to the Holy Synod, which controls all the schools attended by the clergy and in 300 silk-worm culture is taught; while in some 900 schools the children receive instruction in various trades; and in 300 schools in sloyd (a system of manual training originated in Finland). Girls' high schools were established in nearly 100. Nearly 50% of the teachers are women. The total expenditure on education in 1901 was £5,300,000 (about the average in recent years), of which 20% was supplied by the state, 23% by the zemstvos, 35% by the village communities and the municipalities and 11% by private sources. Of all the primary schools, which contributes 25% of the expenditure of the classical and technical schools, by the rates of the pupils (30%), and by donations from the zemstvos and municipalities. The total grants from the state to all educational institutions amounted in 1906 to £8,107,000. The progress of primary education is illustrated by the fact that, while in 1885 there was one school for every 2665 inhabitants and one pupil for every 487, in 1906 there was one school for every 1900 and one pupil for every 930 inhabitants respectively. According to the census of 1897 the number of illiterates varied from 89-2 to 44-9% of the population in the rural districts, and from 63-6 to 37-2% in the urban.

The state of secondary education is very much improved. In 1809 there were 9 universities (Yariv or Dorpat, Kaza, Kharkov, Kiev, Moscow, Odessa, St Petersburg, Warsaw and Tomsk), with 19,400 students, 6 medical academies (one for women), 6 theological academies, 6 military academies or schools, 3 philosophical and 900 primary schools, 230 languages academies, 3 law schools, 4 veterinary institutes, 4 agricultural schools, 2 mining institutes, 4 engineering institutes, 2 universities for women (300 students at St Petersburg), 3 technical pedagogical schools, 4 technical institutes, 1 forestry and 1 topographical school. The number of students, however, being the result of the establishment of new educational institutions, notably technical and commercial schools, which are placed under the new minister of commerce and industry. Finland has a university of its own in Helsinki.

The standard of teaching in the universities is on the whole very high, and may be compared to that of the German universities. The students are hard working, and generally very intelligent. Mostly sons of poor parents, they live in extreme poverty, supporting themselves chiefly by translating and by tutorial work.

The state of secondary education still leaves much to be desired. The steady tendency of Russian society towards increasing the number of civil servants and military, students, who in 1803 were 619, in 1806 2000, and in 1903 30,000, is not without effect on the study of the natural sciences, is checked by the government in favour of the classical gymnasia. Sunday schools and public lectures are virtually prohibited.

A socialistic movement? Socialistic movement in Russia is its tendency to extend to women the means of higher instruction. The gymnasia for girls are both numerous and good. In addition to these, notwithstanding government opposition, a series of newspapers and bulletins have been given to the effort for improvement, and that the question has been seriously taken in hand by the imperial administration and the Duma. What form it will ultimately take depends on the balance between the forces of conservatism and change. The present movement is mainly on the side of the ignorant and simple people, who are in no position to be engaged in the dangerous work of political agitation. The main danger of this socialistic movement is that it will help to disseminate among the peasants the ideas of free government and the desire for an independent State, and to compensate the free will of the commune, and permission for them to migrate elsewhere without losing their communal rights. This was made part of the general reform of Russian local government, which in the autumn of 1910 was still under the consideration of the Duma.

On the effects of the political changes in Russia on the educational system of the country it was, even in the autumn of 1910, too early to say anything save that an undoubted impress had

1 L'Empire des tsars, ii. p. 510.
2 In the ordinary tribunal's weight is given to the "customs" of the peasants, even when these conflict with the written law.
3 The abolition of the special courts of the peasants was announced by the new government as one of the first results of the 1905 reforms. It promised the relief of the peasants from the arbitrary control of the communes, and permission for them to migrate elsewhere without losing their communal rights. This was made part of the general reform of Russian local government, which in the autumn of 1910 was still under the consideration of the Duma.

RUSSIA

of higher schools, in which careful instruction is given in natural and social sciences, have been opened in the chief cities under the name of "pedagogical courses." At St Petersburg a women's medical academy, the examinations of which were even more searched for, was opened in 1899. In the ordinary schools (especially of the elementary classes of men and women) was opened, but after about one hundred women had received the degree of M. D. it was suppressed by government. In several university towns there are free teaching establishments for women, supported by subscription, with programmes and examination results equal to those of the men.

The natural sciences are much cultivated in Russia. Besides the Academy of Science, the Moscow Society of Naturalists, the Chemical-Physical, the Geographical, and the Societies of the Baltic provinces, all of which are of old and recognized standing, there have lately sprung up a series of new societies in connexion with each university, and their serials are yearly growing in importance, as, too, is the Society of the Moscow Society of Friends of Natural Science. The Russian Academy of Science, the Chemical-Physical Society, and various medical, educational and other associations. The work achieved by Russian savants, especially in biology, physiology and chemistry, and in the sciences described in the preceding chapter, is highly important.

The ordinary revenue of the empire is in excess of the ordinary expenditure, but the extraordinary expenditure not only swallow up this surplus, but necessitates the raising of fresh loans. On the other hand, there is a good deal to show for this extraordinary expenditure. A considerable number of new railways, including the Siberian, have been built with money obtained from that source. But since 1894 all extraordinary items of expenditure, with the exception of those for the Crimean War, have been covered from revenue and have consumed nearly the whole of the extraordinary revenue. The only sources of extraordinary revenue still remaining under that head are the money derived from loans and the perpetual deposits in the Imperial Bank. The ordinary revenue, in the 22 bond-year, 1894-1895, of the seven principal revenues is in the main the same as it was in 1884-1885. A comparison of the revenue between two years is of interest.

The system of obligatory military service for all, introduced in 1874, has been maintained, but the six years' term of service has been reduced to five, while the privileges granted to those who have completed five years of service have been slightly extended. During the reign of Alexander III. efforts were mainly directed towards—(1) reducing the time required for the mobilization of the army; (2) increasing the immediate readiness of cavalry for war and its fitness for serving as mounted infantry (hussars and Cossacks); (3) the training of the W. frontier by fortresses and railways; and (4) increasing the artillery, siege and train reserves.

Further, the age of service from service was raised from 40 to 43 years, with the result of increasing the numbers of the reserve. The army is divided into regulars, Cossacks and militia. The peace strength of the army is estimated at 42,000 officers and 1,100,000 men (about 950,000 combatants), while the war strength is increased to 47,500 officers and 4,500,000 men. However, this latter figure cannot be regarded as a fixed one, as the relative importance of the latter service is much below the strength which would be required for such an army; estimates which put the maximum forces of Russia in time of war at 2,750,000—irrespective of the army of Transcaucasia—would indicate that probably between 1,500,000 and 2,000,000 men could be sent, so that in war the army is divided into regulars, Cossacks and militia.

Before the Japanese war the movement of separate squadrons: the Baltic, the Black Sea, the Pacific and the Caspian. But in the operations before Port Arthur and in the disaster of the battle of Tsushima the Russian fleets were almost completely annihilated. The Black Sea fleet, a link of the Black Sea and the Mediterranean, and a few other battle squadrons were, however, still left, and since 1904 steps have been taken to build new ships, both battle squadrons and powerful cruisers. Kronstadt is the naval headquarters in the Baltic, Sevastopol in the Black Sea and Vladivostok on the Pacific.

Geography.—The administrative boundaries of European Russia, apart from Finland, coincide broadly with the natural limits of the East-European plains. In the N. it is bounded by the Arctic Ocean; the islands of Novaya Zemlya, Koguyev and Falagach also belong to it, but the Kara Sea is reckoned to Siberia. To the E. it has the Asiatic dominions of the empire, Siberia and the Kirghiz steppes, from both of which it is separated by the Ural Mountains, the Ural river and the Caspian—the administrative boundary, however, partly extending into Asia on the Siberian slope of the Urals. To the S. it has the Black Sea and Caspian, being separated from the latter by the Manych depression, which in Post-Pliocene times connected the Sea of Azov with the Caspian. The W. boundary is purely conventional: it crosses the peninsula of Kola from the Varanger Fjord to the Gulf of Bothnia; thence it runs to the Kurisches Haff in the southern Baltic, and thence to the mouth of the Danube, taking a great circular sweep to the W. to embrace Poland, and separating Russia from Prussia, Austrian Galicia and Rumania.

It is a special feature of Russia that she has no free outlet to the open sea except on the ice-bound shores of the Arctic Ocean. Even the White Sea is merely a gulf of that ocean. The deep indentations of the gulf of Bothnia and Finland are surrounded by what is ethnologically Finnish territory, and it is only at the very head of the latter gulf that the Russians have taken firm foothold by erecting their capital at the mouth of the Neva. The Gulf of Riga and the Baltic belong to territory which is completely surrounded by Slavonic, and by Finns and Russians. It is only with the last hundred and thirty years that the Russians have definitely taken possession of the N. shores of the Black Sea and the Sea of Azov. The E. coast of the Black Sea belongs properly to Transcaucasia, a great chain of mountains separating it from Russia. But even this sheet of water is an inland sea, the only outlet of which, the Bosphorus, is in foreign hands, while the Caspian, an immense shallow lake, mostly bordered by deserts, possesses more importance as a link between Russia and her Asiatic settlements than as a channel for intercourse with other countries.

The great territory occupied by European Russia—1,600,000 sq. mi. in length from N. to S., and nearly as much from E. to W.—is on the whole a broad elevated plain, ranging between 500 and 900 ft. above sea-level, deep cut into by river valleys, and bounded on all sides by broad swellings or low mountain-ranges: the lake plateaus of Finland and the Maansselka heights in the N.W.; the Baltic coast-ridge and spur of the Carpathians in the W., with a broad depression between the two, occupied by Poland; the Crimean and Caucasian mountains in the S.; and the broad but moderately high swelling of the Ural Mountains in the E. The slight elevations along the coast, which comprise the governments of Tver, Moscow, Smolensk and Kursk, and projects E. towards Samara, attaining an average elevation of 800 to 900 ft. above the sea, the surface slopes gently in all directions to a level of 300 to 500 ft. Then it again rises gradually as it approaches the hilly tracts which enclose the great plain. This central swelling may be considered a continuation towards the E.N.E. of the great line of upbeavals of N.W. Europe; the elevated grounds of Finland would then represent a continuation of the Scandinavian plateau of S. Sweden, and the northern mountains of Finland a continuation of L. Men (the Keel) which separate Sweden from Norway, while the other great line of
upheaval of the old continent, which runs N.W. to S.E., would be represented in Russia by the Caucasus in the S. and by the Timan ridge of the Pechora basin in the N.

The hilly aspect of several parts of the central plateau is not due to folding as much as to the uplift and partial upheaval of a block of sedimentary strata, both horizontal, and chiefly to the excavating action of the rivers, whose valleys are deeply eroded in the plateau, especially on its borders. The round flattened summits of the Valdai plateau do not rise above 100 ft.; and they present the appearance of mountains only in consequence of the broad depression of the central basins towards the depression of Lake Peipsi being only 200 to 250 ft. above the sea. The same is true of the plateaux of Livonia, "Wendish Switzerland," and the government of Kovno, which do not exceed 100 ft. above sea level, and which have only a few small and insignificant ravines. The Baltic coast-ridge between the governments of Grodno and Minsk, with the broad depressions between, is the lowest part of the central basin, and is quite a hilly aspect to the country. It is only in the S.W., where spurs of the Carpathians enter the governments of Volhynia, Podolia and Bessarabia, that ridges reaching 1100 ft. are met with, these again intersected by deep ravines.

The depressions which gap the borders of the central plateau thus acquire a greater importance than the small differences in its vertical elevation. Such is the broad depression of the middle Volga and lower Kama, bounded on the N. by the faint swelling of the Uvlya, and on the S. by the Arctic Ocean and the Volga basin. Another broad depression, 250 to 500 ft. above the sea, still filled by Lakes Peipus, Ladoga, Onega, Byelo-ozero, Lacha, Vozhe, and many thousands of smaller lakes, skirts the central plateau on the N., and extends from the Arctic Ocean to the N.E. and N. It penetrates from the N.W., about Lake Onega, and reaches 900 ft., while in the N.E. it is enclosed by the Timan ridge (1000 ft.). A third depression, traversed by the Priepet and the middle Dnieper, extends from the Arctic Ocean to the N. and N.E., and is flanked by the depression stretching W. and E. through Potskaya and Kharkov, but still reaching in its higher parts 500 to 700 ft. It is separated from the Black Sea by a gentle swelling which may be traced from Kremenets to Volynia to the lower Don, and perhaps farther S.E. This depression, which includes the Don, Desna, and the more granitic ridges which rise to the rapids of the Dnieper. Finally a fifth depression, which descends below the level of the ocean, extends for more than 200 m. to the N. of the Caspian, comprising the river Volga and the Ural and Yenisei rivers, and establishing the link between Russia and the Aral-Caspian region. It is continued farther N. by plains below 300 ft., which join the depression of the middle Volga, and extend as far as the mouth of the Oka.

The remaining part of the central plateau, succeeding strata no longer exhibit the horizontality which is characteristic of central Russia, and moreover are deeply cut into by rivers. They are connected with the W. by broad plateaus which join those of central Russia, and from which great canals and railway lines must be more closely studied before they can be definitely pronounced on.

The rhombohedral peninsula of the Crimea, connected by a narrow isthmus with the continent, consists of a deeply indented and plateau-like basin, which is occupied by the Sea of Azov, a very shallow body of water, which is bordered on the E. by the Kuban, and on the S. by the Black Sea. The basins of the Sea of Azov and the Black Sea are very shallow, and the latter, besides being cut off from the Mediterranean by the Bosporus and the Dardanelles, is also very shallow, being connected with the Mediterranean only by the narrow strait of the Silex, where its depth is little more than 100 fathoms.

Rivers. The origin of the rivers of Russia is from a series of lacustrine basins scattered over the plateau and differing slightly in elevation, the Russian rivers describe immense curves before reaching the sea, and flow with a very gentle slope, which in many cases is compensated for by overland transport, and even if the natural valley is flat, the rivers flow in beds of earth and gravel, and therefore very little head is necessary to maintain a good flow. The rivers have spread from their sources, which are often remote, and have been drawn into canals and navigation systems, which have been constructed for their conveyance.
part constitutes the frontier between European Russia and the Kirghiz steppe; it receives the Sakmar on the right and the Ilek on the left. The Kuma, the Terek and the Kura, with the Aras, which receives the waters of Lake Gok-cha, belong to Caucasian. The Volga, after crossing the Southerly forests and the black earth (chernozem) region, forms the main drainage system, reaching the Caspian Sea on the border between European Russia and the Caspian Autonomous Republic.

Soil. Although most of the surface of Europe and Russia is covered by forests and marshes, the vegetation is quite diverse, with different types of flora depending on the region. The Russian Federation is home to a wide variety of ecosystems, including wetlands, forests, and tundra.

Climate. The climate of Russian is characterized by its continental nature, with extreme temperature fluctuations between winter and summer. The winter is long and cold, with temperatures often dropping below freezing. The summer is short, but temperatures can reach high levels, especially in the south of the country.

Flora. The flora of Russia is diverse, with a wide variety of species, including many endemic species. The country is home to numerous national parks and reserves, which are important for the conservation of its natural heritage.
being known. Four regions may be distinguished: the Arctic, the Forest, the Steppe and the Circum-Mediterranean.

The Arctic Region comprises the tundras of the Arctic littoral beyond the N. limit of the forests, which closely follows the coast-line, with deviations towards the N. in the river valleys (70° N. in Finland and on the Arctic Circle about Archangel, 68° N. on the Arctic Circle in Siberia). The soil is necessarily thin, as the deficiency of drainage and the depth to which the soil freezes in winter, are the circumstances which determine the characteristic features of the vegetation of the tundras. Their flora is far closer akin to that of the far N. tundras than to that of any other region in central Europe. Mosses and lichens are distinctive, as also are the birch, the dwarf willow and several shrubs; where the soil is drier, and humus has been able to accumulate, a variety of herbage forms flowering plants, some of them familiar in W. Europe, make their appearance. Only 275 to 280 phanerogams are found in this region.

The Forest Region of the Russian botanists includes the greater part of the country, from the Arctic tundras to the steppes, and over this immense expanse it maintains a more remarkable uniformity of character. Beketov subdivides it into two portions—the Forest region proper and the “Ante-Steppe” (predstepi). The N. limit of the ante-steppe is represented by a line drawn from the Fruth through Zhitomir, Kursk, Taganrog and onto the shores of the Urals. But the forest region proper presents a different aspect in the N. from that in the S., and must in turn be subdivided into two parts—the coniferous forest and the region of the oak forests being separated by a line drawn through Orel, Pskov, Kostroma, Kazan and Ufa. Of course the oak occurs farther N. than this, and coniferous forests extend farther S., advancing even to the border-region of the steppes. To the N. of this line the forests are of great extent and densely grown, more frequently diversified by marshes than by meadows or cultivated fields. Vast and impenetrable marshes, impassable bogs and thickets, numerous lakes, swampy meadows, with cleared and drained parts here and there occupied by villages, or the leading features of this region. Fishing and hunting are the most important sources of livelihood. The characteristics of the oak region, which comprises all central Russia, are totally different. The surface is undulating; the land is lower and there is a greater length of flat watersheds, and only a few in the deeper and broader river valleys. Forests are still numerous where they have not been destroyed by the hand of man, but their character has changed. Conifers are rare, and tree-felling which is abundant on the sandy plains, takes the place of the Abies. The coniferous and flowering vegetation is more prominent on the islands of the numerous villages strung along the banks of the streams.

Viewed as a whole, the flora of the forest region is to be regarded as European-Siberian; and, though certain species disappear towards the E., while new ones may appear on the whole, the same features throughout from Poland to Kamchatka. Thus the beechn (Fagus sylvatica) is unable to survive the continental climate of Russia, and does not penetrate beyond Polotsk and the S.W. provinces appearing again in the Crimea. The silver fir does not extend over Russia, and the oak does not cross the Urals. On the other hand, several Asiatic species (Siberian pine, larch, cedar) grow freely in the N.E., while numerous shrubs and herbaceous plants, originally from the Asiatic steppes, have found their way into the S.E. But all these do not greatly alter the general character of the vegetation of this region, for the northern belt, besides conifers, the birch (Betula alba, B. pubescens, B. fruticosa and B. verrucosa), which extends from the Pechora to the Caucasus, the Aspen, two species of elder, the mountain-ash (Sorbus aria and S. aucuparia), a species of willow. S. of 62° to 64° N. appears the lime tree, which multiplies rapidly and, notwithstanding the rapidity with which it is being exterminated, constitutes entire forests in the east (central Volga, Ufa). Further S. the alder (Alnus incana) and the birch (B. pubescens) appear in the border-region (Urals) reaching in isolated groups and single trees as far N. as St Petersburg and South Finland (Q. Robur appears only in the S.W.). The hornbeam is prevalent in the Ukraine, and the maple begins to appear S. of the S.-W. of Russia, and only a few species of rare trees, like Fagus sylvatica, are found in the Archangel government (only 436 to the E. of the White Sea, which is a botanical limit for many species). In central Russia the species become still more numerous, and, as the local flowers are not yet complete, they number 850 to 1050 species in the separate governments, and about 1600 in the best explored parts of the S. W. Coniferous is cultivated throughout this region, and the N. limit of the coniferous forests is reached by the mountain-ash, 62° N., being carried through Salhenor and Lugañsk. S. of this line begin the steppes proper, which extend to the sea and penetrate to the foot of the Caucasus.

The steppes proper are very fertile, elevated plains, slightly undulating and occupied by numbers which dry up in summer. The undulations are scarcely apparent. Not a tree is to be seen, the few woods and thickets being hidden in the depresions and deep valleys of the rivers. On the thick layer of black earth, which is the basis of the steppes, are spread numerable grasses, and, as these are intersected by the steppe-grass (Stipa pennata) wave in the wind, tinting the steppe a bright yellow. For days together the traveller sees not other vegetation; even this, however, disappears as he approaches the Caspian and the black earth. Here begins the Aral-Caspian desert. The steppe, however, is not so devoid of trees as at first sight appears. Numerable clusters of wild cherries (Prunus Chaenomeles), wild apricots (Aegyptis manica), the Siberian juniper (Juniperus fruticosa) and other deep-rooted shrubs grow at the bottoms of the depressions and on the slopes of the ravines, imparting to the steppe that charm which manifests itself in the popular poetry. The Karakum, the Caspian salt desert, and the adjacent sand formations are all on the steppe, and the salt lakes are the only oasis in this region. The soil is rich in reeds and a few willow and other shrubs—these are the only plants in the deserts; they are the so-called “islands” in the desert.

The vegetation in the marshy bottoms of the basins and in the delta of the Volga is very rich, and forms the most luxuriant vegetation of the whole region. The moist soil encourages luxuriant thickets of willows (Salicaceae), surrounded by dense clumps de-frise of wormwood and thorny bearings Cotoneaster, and interspersed rich with but not extensive flowers, is the most luxuriant vegetation of the whole region. The sandy bottoms of the basins and in the delta of the Black Sea rivers impenetrable beds of reeds (Arundo phragmites) shelter a forest fauna. But vegetation rapidly changes the physiognomy of the steppe. The prairies are succeeded by steppe-grass (Stipa pennata) and by fields, and flocks of sheep destroy the true steppe-grass (Stipa pennata). A great many species unknown in the forest region make their appearance in the steppes. The Scotch pine still grows on all sandly spaces, and the maple (Acer tatarica and A. campestris), the hornbeam and the black poplar are very abundant. The number of species of herbaceous plants rapidly increases, while beyond the Volga a variety of Asiatic species are added to the W. European flora.

The Circum-Mediterranean Region is represented by a narrow...
strip on the S. coast of the Crimea, where a climate similar to that of the Mediterranean coast has permitted the development of a flora closely resembling that of the valley of the Arno in Italy. Human civilization has destroyed the abundant forests which sixty years ago covered most of the peninsula, and only hunting is possible. Some firs and the chestnut are rare; but the beech reappears, and the Pinus pinaster recalls the Italian pines. At a few points, such as Nikita na Livadka and Alupka, where plants have been acclimatized by human agency, the Californian Wollastonia, the Lebanon cedar, mugho pines, and palm (Chamaerops excelsa) flourish. The grass vegetation is very rich, and, according to lists still incomplete, no fewer than 1654 flowering plants are known. But on the whole, the Crimean flora is little in common with that of Caspian deserts.

Russia belongs to the same zoo-geographical region as Central Europe and N. Asia, the same fauna extending in Siberia as far as the Yenisei and the Lena. In the forests not many species of mammals that have flourished in W. Europe have held their ground; while in the Urals only a few are now to be found, but formerly also European—met with. In S.E. Russia, however, towards the Caspian, there is a notable admixture of Asiatic species. Three separate sub-regions may, however, be distinguished on the E. European plains—the tundras, including the Arctic islands, the forest region, especially the coniferous part of it, and the ante-steppe and steppes of the black earth region. The Ural Mountains might be distinguished as a fourth sub-region, which is very analogous to the Caspian area, as well as the Caspian deserts, each having their own individuality.

The fauna of the Arctic Ocean off the Norwegian coast corresponds, in its W. parts at least, to that of the Atlantic Gulf Stream, while in the E. part it becomes much richer. The most interesting of the mammals that are found on the Kola peninsula belong to a separate zoological region, connected with, and hardly separable from, that part of the Arctic Ocean which washes the Siberian coast as far as the mouth of the Lena. The Black Sea, the fauna of which appears to be very rich, belongs to the Mediterranean and Aegean area, but the adjacent Caspian partakes of the characteristic fauna inhabiting the lakes and seas of the Aral-Caspian depression.

In the region of the tundras life has to contend with such unfavourable conditions that it requires much endurance. Still, the reindeer frequents it for its lichens, and on the drier slopes of the moraine deposits there occur four species of lemming, hunted by the Arctic fox (Vulpes lagopus). The willow-grouse (Lagopus alpestris) and the willow-raven (Corvus monedula), the latter occasionally hunting (Plectrohans nivalis), two or three species of Sylvia, one Phylloscopus and a Motacilla must be added. Numberless aquatic birds visit it for breeding purposes. Ducks, divers, geese, gulls, all the dark Russian species of snipes and sandpipers (Lymnocorax, Tringa), &c., swarm on the marshes of the tundras and on the crags of the Lapland coast.

The forest region, and especially its coniferous portion, though it has lost some of its representatives within historic times, still possesses a fairly robust fauna. The bear is now seen only in the mountains of Olenetz and Vologda; Cerus pygargus is found everywhere, and reaches Novgorod. The weasel, the fox and the hare are exceedingly abundant, as also are the various squirrels. The great and the common raven, the lynx and the elk (C. alces) are rapidly disappearing. The wild boar is confined to the basin of the W. Dvina, and the Bison europae to the Byelovozh forest in Gродno. The sable has quite disappeared. For flora of the tundras Beloborodov's "flora of Archangel"—trapped at a few places in Minsk, and the otter is very rare. On the other hand, the hare, grey partridge (Perdix cinerea), hedgehog, quail, lark, rock and stork find their way into the coniferous forest as the forests are cleared. The avifauna of this region is very rich. With the bird of paradise, the brown eagle, the black stork, the eagle, the swan, the curlew, the partridge, the cock pheasants and teal, the hoopoe, the woodpecker, the woodcock, the heron, the hippopotamus, the sable, the otter, the beaver, the marten, the polecat, the ferret, the common marmot and the yellow moufflon, the fauna of W. Europe, except the carp, are met with in the lakes and rivers in immense quantities, the characteristic feature of the region being its wealth in Corogoni and in Salmonidae generally.

The forest region of Siberia is less rich in species, such as Pteromys volans and Tamias striatus, disappear, but common squirrel (Sciurus vulgaris), weasel and bear are still met with in the forests. The hare is increasing rapidly, as well as the fox. The avifauna, of course, becomes poorer; nevertheless, the woods of the steppes and the tundras are an immense refuge to many birds, even to hazel-hen (Tetrao ilomass), capercaillie (T. tetrix) and woodcock (T. urogallus). The fauna of the river in the lower valleys is extremely rich, and includes aquatic birds. The destruction of the forests and the advance of wheat into the prairies are rapidly thinning the steppe fauna. The various species of rapacious birds are disappearing, together with the colonies of bats; and the insectivores are also becoming scarce in consequence of the destruction of insects; while vermin, such as the suslik, or pouched marmot (Spermophilus), and the destructive insects which are a scourge to agriculture, become a real plague. The absence of Careogoni is a characteristic feature of the fish-fauna of the steppes; the carp, on the contrary, reappears, and the rivers abound in sturgeons (Acipenseridae). In the Volga below Nizhniy-Novgorod (Anguilla Rhomaeus) becomes the southern Urals, and in such quantities that they give occupation to nearly 100,000 people. The mouths of the Caspian rivers are especially celebrated for their wealth of fish.

Ethnography.—Remains of Palaeolithic man, contemporary with the large Quaternary mammals, are few in Russia; they have been discovered only in Poland, Pultzhe and Voronezh, and perhaps also on the Oka. Those of the later Lacustrine period, on the contrary, are so numerous that there is scarcely an area of the lacustrine basin in the regions of the Oka, the Kama, the Don and the Volga that does not contain remains of the Palaeo-Neanderthal race, as well as a very great variety of implements and Tethyan and Bronze artefacts.

In the 17th century S. Russia was the seat of the empire of the Khazars, who drove the Bulgarians, descendants of the Huns, from the Don, one section of them migrating up the Volga to found there the Bulgarian empire, and the remaining travelling towards the Danube. This migration compelled the N. Finns to advance farther W., and a body of intermingled Tavasts and Karelians penetrated to the S. of the Gulf of Finland.

1. Bibliography of Fauna: see Pallas, Zoographia Rosso-Asiatica; Syvertsov for the birds of south-eastern Russia; M. A. Bogdanov, Birds and Mammals of the Black-Bear Earth Region of the Volga Basin (in Russian); V. F. de Sausset for fishes; Strach, Die Schlangen des Russ. Reiches, for reptiles generally; Rodoszkowski and the publications of the Entomological Society generally for insects; Czerny for the marine fauna of the Black Sea; Kessler for that of Lakes Omega and Ladoga; and finally, G. D. Molvigni, for the mammals of the Russian provinces. A. T. von Middendorf's Siberische Reise, vol. iv., Zoology (St Petersburg, 1875), though dealing more especially with aboriginal races, also contains valuable information for the Russian fauna generally. A. E. Nordenskiöld's Vego-expeditionens Vetenskapliga Takttagelse (5 vols., Stockholm, 1872-87) may be consulted for the mammals of the tundra region and marine fauna. For more detailed bibliographical information see Apercu des travaux zoographiques, published at St Petersburg in connexion with the Exhibition of 1878; and the index Uzakatul Russkoi Literatury for natural science, mathematics and medicine, published since 1872 by the Society of the Kiev University.
As early as the 8th century, and probably still earlier, a stream of Slav colonization, advancing E. from the Danube, poured over the plains of S.W. Russia. It is also most probable that another similar stream—from the N. coming from the Elbe, through the basin of the Vistula—ought to be distinguished. In the 9th century the Slavs occupied the upper Vistula, the S. of the Russian lacustrine region, and the W. of the central plateau. They had Lithuanian to the W.; various Finnish tribes, intermingled towards the S.E. with Turkish (the present Bashkirs); the Bulgars, whose origin still remains doubtful, on the middle Volga and Kama; and to the S.E. the Turkish-Mongol races of the Pechenegs, Polovtse, Uzes, &c., while in the S., along the Black Sea, was the empire of the Khazars, who had under their rule several Slav tribes, and perhaps also some of Finnish origin. In the 9th century also the Ugrians are supposed to have left their Ural abodes and to have traversed S.E. and S. Russia on their way to the basin of the Danube. If the Slavs be subdivided into three branches—the W. (Poles, Czechs and Wends), the S. (Servians, Bulgarians, Croatians, &c.), and the E. (Great, Little and White Russians), it will be seen that, with the exception of some 3,000,000 Little Russians, now settled in East Galicia and in Poland, and of a few on the southern slope of the Carpathians, the whole of the E. Slavs occupy, as a compact body, W., central and S. Russia. Like all races of mankind, the Russian race is not pure. The Russians have absorbed and assimilated in the course of their history a variety of Finnish and Turkic-Finnish elements. Still, craniological researches show that, notwithstanding this fact, the Slav type has been maintained with remarkable persistency: Slav skulls ten and thirteen centuries old exhibit the same anthropological features as those which characterize the Slavs of our own day. This may be explained by a variety of causes, of which the chief is the maintenance by the Slavs down to a very late period of gentile or tribal organization and gentile marriages, a fact vouched for, not only in the pages of the Russian chronicle, but still more by visible social evidences, the gens later developing into the village community, and the colonization being carried on by large co-ordinated bodies of people. The Russians do not emigrate as isolated individuals; they migrate in whole villages. The overwhelming numerical superiority of the Slavs, and the very great differences in ethnic type, belief and mythology between the Indoeuropean and the Ural-Altaic races, may have something to do with the same end. Moreover, when the Slavs, far away from home, among the Siberians, readily marry a native, the Russian woman seldom does the like. All these causes, and especially the first-mentioned, have enabled the Slavs to maintain their ethnic purity in a relatively high degree, whereby they have been enabled to assimilate foreign elements and make them intensify or improve the ethnic type, without giving rise to half-bred races. The very same N. Russian type has thus been maintained from Novgorod to the Pacific, with but minor differentiation on the outskirts—and this notwithstanding the great variety of races with which the Russians have come into contact. But a closer observation of what is going on in the recently colonized confines of the empire—where whole villages live without mixing with the natives, but slowly bringing them over to the Russian manner of life, and then slowly taking in a few female elements from them—gives the key to this feature of Russian life.

Not so with the national customs. There are features—the wooden house, the oven, the bath—which the Russian never abandons, even when swamped in an alien type. But when settled among the Germans, the N. Russian—readily adapts himself to many other differences. He speaks Finnish with Finns, Mongolian with Buriats, Ostiak with Ostiaks; he shows remarkable facility in adapting his agricultural practices to new conditions, without, however, abandoning the village community; he becomes hunter, cattle-breeder or fisherman, and carries on these occupations according to local usage; he modifies his dress and adapts his religious beliefs to the locality he inhabits. In consequence of all this, the Russian peasant (not, be it noted, the trader) proves himself to be an excellent colonist.

Three different branches can be distinguished among the Russians from the dawn of their history:—the Great Russians, the Little Russians (Malorusses or Ukrainians), and the White Russians (the Byelorusses). These correspond to the two currents of immigration mentioned above—the former with perhaps an intermediate stream, the proper place of the White Russians not having been as yet exactly determined. The primary distinctions between these branches have been based not so much on different blood as on contact with different nationalities—the Great Russians absorbing Finnish elements, the Little Russians undergoing an admixture of Turkish blood, and the White Russians submitting to Lithuanian influence. Moreover, the ethnical type they exhibit is itself a result of a great mixing together of the several races of the Russian states, and it is impossible to define with exactness the ethnical type of the Great Russians themselves two separate branches, differing from one another by slight divergences of language and type and deep diversities of national character—the Central Russians and the Novgorodians. The latter extend throughout N. Russia into Siberia. Many minor ethnological differences can be distinguished among both the Great and the Little Russians, depending probably on the assimilation of various minor subdivisions of the Ural-Altaikans.

The Finnish races occupy in one compact mass the space enclosed by a line drawn from the White Sea to Lake Paxov, the upper courses of the W. Dvina and the Donets, and thence, through the mouth of the Sura, by the Vetluga, to the Mezef. To the E. of this line, and further back, they are represented by the Ostiaks (Malorusses). When the Ural mountains they reappear in a second compact body, and thence extend through S. Siberia and along the courses of the Lena and the Amur. Great Russian Nonconformists are disseminated among Little Russians and among the Nonconformists of Cis-Uralians. Moreover, they are represented, in greater masses in Novgorod (i.e. S. Rusia), as also in N. Caucasus.

The Little Russians occupy the steppes of S. Russia, the S.W. slopes of the central plateau and those of the Carpathian and Lublin mountains. They are represented by the minor subdivisions that inhabit Podolia, Volynia, Poltava, and Kiev. The Zaporozhian Cossacks colonized the steppe farther E., towards the Don, where they met with a large population of Great Russian runaways, constituting themselves into the Don Cossacks. There they sent the Lithuanian Catherine II. to colonize the E. coast of the Sea of Azov, constituted the Black Sea and later the Kuban Cossacks (part of whom, the Nekrasovites, migrated to Turkey). They have also populated the S.W. slopes of the S.E. of Russia. The White Russians, intermingled to some extent with Great and Little Russians, Poles and Lithuanians, occupy the upper parts of the W. slope of the central plateau. The Finnish races, which in prehistoric times extended from the Ob all over N. Russia, even then were subdivided into Ugrians, Permians, Bulgarians and Finns proper, who drove back the precocious Lapp population from what is now Finland, and about the period of the Christianization of the Rus. the Finns, from the region of the Ural, Sura, Kama and Volga rivers, were classified by some authors with the following: (a) The W. Finns, the Tavasts, in central Finland; the Kvaens, in N.W. Finland; the Letts, who occupy the S.E. of the country, and the Ufas and Ochum, extend also into Perm and S.W. Russia. (b) The Volga Finns, or the other Russian branch, to which belong the Mordvians, the Udmurts, the Mari, who inhabit the region of the Uplands, and more to the S.S.W., the Vyatka, though usually classified with the other Finns, are separated by some authors from the others, and are classified by some authors with the following; (c) the Permians, or the Ural-Elbasanians, including the Volga Finns on the Ural, the Ostiaks in Tobolsk and partly in Tomsk, and the Magyars, or Ugrians. The following are the chief subdivisions of the Turko-Tatars in European Russia:—(1) The Tartars, of whom three different branches are known: the Kazakhs live on both banks of the Volga, below the mouth of the Oka, and on the lower Kama, and penetrating farther S. in Ryzya, Tambov, Samara, Simbirsk and Penza; (b) the Tartars of Astrakhan at the mouth of the Volga, and from them have spread the S. Tatars, and (c) the Don Tartars after the Crimean War (1854–56). There are, besides, a certain number of Tartars in the S.E. in Minsk, Grodno and Vilna. (2) The Bashkirs, who inhabit the slopes of the S. Urals, that is, the steppe-like Don Cossack and Tatar lands, and the Cossacks, including the Cossacks, on the right bank of the Volga, in Kazan and Simbirsk. (4) The Mescheryaks, a tribe of Finnish origin who formerly inhabited the basin of the Oka, and, driven thence during the 15th century by the Usi, invaded the Ufa and Perm provinces, where they now live among the Bashkirs, having adopted their religion and customs. (5) The Teptuyns, also of Finnish origin.
settled among the Tatars and Bashkirs in Samara and Vyatka. The Bashkirs, Meshcheryaks and Teptys rendered able service to the Russian government against the Kirghiz, and until 1803 they constituted a separate Cossack army. (6) The Kirghiz, whose true abodes are in Bashkortostan and on the river Ishim, and after many wars with the Cossacks, one part of them was taken in by the Don Cossacks, so that even now there are among these Cossacks several Kalmyk cossacks or squadrions. They live for the most part in tents, and support themselves by breeding livestock and partly by agriculture.

The Semitic race is represented in Russia by the Kalmucks, who inhabit the steppes of Astrakhan between the Volga, the Don and the Kuma. They are Lamaists by religion and immigrated to the mouth of the Volga from Dzungaria, in the 17th century, driving out the Kirghiz and Nogais, and after many wars with the Cossacks, one part of them was taken in by the Don Cossacks, so that even now there are among these Cossacks several Kalmyk cossacks or squadrions. They live for the most part in tents, and support themselves by breeding livestock and partly by agriculture.

The state religion is that of the Orthodox Greek Church (Orthodox Catholic or Orthodox Eastern Church). Its head is the tsar; but although he makes and annuls all appointments, he does not determine questions of dogmatic theology. The principal ecclesiastical authority is the Holy Synod, the head of which, the Procurator, is one of the council of ministers and exercises very wide powers in ecclesiastical matters. In theory all religions may be freely professed, except that certain restrictions, such as domicile,¹ are laid upon the Jews; but in actual fact the dissenting sects are more or less severely treated. According to returns published in 1905 the adherents of the different religious communities in the whole of the Russian empire numbered approximately as follows, though the heading Orthodox Greek includes a very great many Rasokolniki or Dissenters. Indeed it is estimated that there are more than 12,000,000 Dissenters in Great Russia alone.

The ecclesiastical heads of the national Orthodox Greek Church consist of three metropolitans (St Petersburg, Moscow, Kiev), fourteen archbishops and fifty bishops, all drawn from the ranks of the monastic (celibate) clergy. The parochial clergy are celibate in fact as far as they may be married when appointed, but it left widowers may not marry again.

All Russians, with the exception of a number of White Russians who belong to the United Greek Church (see Roman Catholic Church), profess the Orthodox Greek faith or belong to one or other of the numberless dissident sects. The Poles and most of the Lithuanians are Roman Catholics. The Esth and all other Western Finns, the Germans and the Swedes are Protestant. The Tatars, Bashkirs and Kirghiz are Mahomedans; but the last-named have to a great extent maintained along with Mahomedanism their old Shamanism. The same holds good of the Meshcheryaks, both Moslem and Christian. The Mordvinians are nearly all Orthodox Greek, as also are the Votyaks, Voguls, Cheremis and Chuvashes, but their religions are, in reality, modifications of Shamanism under the influence of some Christian and Moslem beliefs. The Moguls, though baptized, are in fact believers in fetishism as much as the scattered Samoyedes. Finally, the Kalmucks are Lamaite Buddhists.

In his relations with Moslems, Buddhists and even fetishists the Russian peasant looks rather to conduct than to creed, the latter being in his view simply a matter of nationality. Indeed, towards paganism, at least, he is perhaps even more tolerant, preferring on the whole to keep on good terms with pagan divinities. The numerous outbreaks against the Jews are directed, not against their creed, but against them as keen business men and extortionate money-lenders. Any idea of proselytism is quite foreign to the ordinary Russian mind, and the outbursts of proselytizing zeal occasionally manifested by the clergy are really due to the desire for "Russification," and traceable to the influence of the higher clergy and of the government.

¹ The restrictions on domicile were to some extent relaxed in the beginning of 1907.
RUSSIA [RELIGION]

It is this political rather than religious spirit which also underlies the repressive attitude of the government, and of the Orthodox Church as the organ of the government, towards the various dissident sects (Raskolnik, from raskol, schism), which for more than two centuries past have played an important part in the popular life of Russia, and, since the political developments of the end of the 19th and early years of the 20th century, have tended to do so more and more. To understand the problem of the Raskolniki it is necessary to bear two things in mind: the fundamental principle of Eastern Orthodoxy as distinct from Western Catholicism, and the practical identification in Russia of the National Church with the National State. The very basis of Orthodoxy is that the Church is by Christ's ordinance unalterable, that its traditional forms, every one of which is a vehicle of saving grace, were established in the beginning by Christ and his apostles, and that consequently nothing may be added or altered. The trouble began early in the 17th century with the attempt, made in connexion with the printing of the liturgical books, to emend certain ritual details in which there was proved to have been a departure from primitive usage;1 it came to a head under the tsar Peter (q.v.), and led to a synodical debate in 1654; one bishop alone, Paul of Colomna, dissented, and he was deposed, knouted and kept in prison till he died mad. In 1666 the synod anathematized the adherents of the old forms, and the anathema was confirmed by those of 1666 and 1667. To the conservatives, known subsequently as Old Ritualists or Old Believers, this marked the beginning of the reign of Antichrist (was not 666 the number of the Beast?); but they continued the struggle, conservative opposition to the Westernizing policy of the tsars, which was held responsible for the introduction of Polish luxury and Latin heresy, giving it a political as well as a religious character. The rising of the Strelets in 1682 all but gave them the victory; the crushing of the rising relegated them definitely to the status of schismatics. They were placed in still completer antagonism to the established Orthodox Church by the innovations of Peter the Great. The Muscovite tsars had pursued them with fire and sword. The Russian emperors, having established themselves as heads of the Church and the Holy Synod as a state department, were not likely willingly to tolerate their existence.

The Raskol was threatened with extinction by the gradual dying out of its priests, which led to a further schism within itself, into the Popovshchina (with priests) and the Bazopovshchina (without priests). The Popovshi, who were served by priests converted from the Orthodox Church, made their headquarters in the island of Werka, in a tributary of the Dnieper, in Poland (1695), and after its destruction by the government in 1735 and again in 1764, at Starodubye in the government of Chernigov, whence their doctrine spread in the country of the Don. In 1771 their headquarters were fixed at Moscow, in the Rogoshsky cemetery assigned to them during the plague; here they had a monastery, seminary and consistory, until they were ejected by the emperor Nicholas I. In 1832 priests were forbidden to join them, and they had to apply to a deposed Bosnian metropolitan, who became their chief bishop, establishing his see in the monastery of Belokristsia in Bukovina. In 1832 the wonder of the Popovshchina passed a circular letter making advances to the government with a view to a compromise, which was arranged on the basis of the Old Believers consenting to accept the ministrations of Orthodox priests on condition that they should use the unrevised books. This led to a further schism into three sections: those who recognize the metropolitan and the compromise (Edimoversiti, or confirmed), those who recognize the metropolitan but repudiate the compromise, those who repudiate both (Bieglopooversiti). There had already been other schisms on such questions as the right way to swing a censor and the legality of self-immolation for the Lord's sake.

The Bazopovshi, known also as Pomoranye, because they are

1 The most important alterations were the repetition twice, instead of three times, of the "Alleluia" at the Eucharist, and the making the sign of the cross with two fingers instead of three.

mainly found in the sparsely populated country near the White Sea, are in some ways more remarkable. They reject the ministration of priests altogether, since in the time of Antichrist (i.e., the heretic tsar) the only sacrament that remains is baptism. They therefore elect elders, who expound the Scriptures, baptize and hear confessions. They are, however, in no sense evangelicals in the Western sense; for they observe rigorous fasts, reverence icons, and believe implicitly in the efficacy of the multiplication of crossings, bowings and prostrations. They have, moreover, thrown off from time to time a number of extravagant offshoots. Such are the Philippostoi, founded by one Philip (who burned himself alive for Christ's sake in 1743), who have exalted self-immolation into a principle; the Stranniki (pilgrims) and Byeguni (runners), who interpret Matt. x. 37 ff. literally, and reject legal marriage; the Nyetoosti (denyers), who deny the necessity for common worship, since there are no priests; the Molchalytniki (mates), whom no torture can persuade to utter a word.

Closely akin to these, though not derived from the Old Believers, are certain mystic sects which deny the efficacy of the sacraments altogether. Of these the most remarkable are the Khlystovs (flagellants), from klyesat, "to strike, lash," but possibly a corruption of Khristi, "Christs"). They originated in 1645, when, according to their belief, God the Father descended in a chariot of fire on Mount Gorodim, in the province of Vladimir, and took up his abode in a peasant named Daniel Philippov, who chose another peasant, named Ivan Suslov, for his son, the Christ. Suslov selected a "mother of God" and twelve apostles. Though twice crucified and once flayed by order of the tsar, he always rose again, and did not die till 1716. Suslov chose a successor in one Prokopy Lupkin, and since then—in the belief of the sect—every generation, even every community, has had its Christ and its "mother of God," who are worshipped by reason of the Divine Spirit dwelling in them. It is the duty of all believers to strive to become one or other of these by subduing the flesh, which is the product of Evil, and all motions of the will. Each community is presided over by an "angel," or prophet, and a prophetess, whose word is law. All alike are subject to the twelve commandments issued by the "Sabbath," that is to say Daniel Philippov. These include the prohibition of alcoholic drink, of fleshly sins and of marriage, and the incultation of flesh in the Holy Ghost and complete surrender to his influence. At their prayer-meetings the Khlystsi dance to the accompaniment of hymns, the dance gradually developing into a wild dervish-like spinning which is kept up till they drop, foaming at the mouth and prophesying. Perhaps the most remarkable fact about this sect is that it is secret, and that its members ostensibly belong to the Orthodox Church.

An offshoot of the Khlystsi is the more celebrated secret sect of the Skoptsi (skopets, a eunuch), which represents an extreme ascetic reaction from the promiscuous immorality of some (by no means all) of the Khlystsi. Their idea of attaining salvation is self-mutilation according to the counsel of perfection implied in Matt. xix. 12 and xviii. 9, 9. "The royal seal" is complete self-castration; partial mutilation is known as the "second purity." In the case of women the mutilation usually takes the form of protruding the teeth and the upper lip. This horrible sect, which was founded by one Selivanov in the last quarter of the 18th century, seems to have a morbid attraction for people of all classes in Russia, and all the efforts of the government have not succeeded in stamping it out (see Skoptsi).

Closer akin to certain Western forms of dissidence from traditional Catholicism, though of native growth, are the Molokans, so called popularly because they continue to drink milk (moloko) during fasts. Their origin is unknown, but they are officially mentioned as early as 1765. They style themselves "truly spiritual Christians," and in their rejection of the sacraments, their indifference to outward forms, and their insistence on the spiritual interpretation of the Bible ("the letter killeth"), they are closely akin to the Quakers, whom they resemble also in their inoffensive mode of life and the practice of mutual help.
From the Molokani the Dukhoborts, in England better known as Doukhobors (q.v.), are distinguished by their subdivision of the Scriptures to the authority of the "inner light." They are dualists, like the Bogomils (q.v.), ascribing the body to a fall from a state when the soul was on the same plane as God. The Incarnation was no isolated historical occurrence, but it is repeated over and over again in the faithful, each one of whom is in a certain sense God, by virtue of the indwelling Spirit. Both the Molokani and the Dukhoborts deny the authority of the civil government as such, and object on principle to military service. The former, however, give little trouble; on the other hand, the government has from time to time proceeded with extreme severity against the Dukhoborts, whose refusal to serve in the army, if allowed to go unpunished, would have set a contagious example.

Dissidence of all kinds has made a considerable advance since the emancipation of the serfs in 1861, the increase—as might be expected in a wholly illiterate population—being greatest in the more extravagant sects. On the other hand, Western Protestantism has also made great headway, notably the Stundists, whose rationalistic-Protestant teaching has gained a firm foothold especially in Little Russia, where the Razkol never penetrated. The Baptists have also made considerable progress, notably among the Molokani.

Social Conditions.—The old subdivisions of the population into orders possessed of unequal rights is still maintained. The great mass of the people, 81.6%, belong to the peasant order, the others being: nobility, 1.3%; clergy, 0.9%; the burghers and merchants, 9.3%; and military, 6.1. Thus more than 88 millions of the Russians are peasants. Half of them were formerly serfs (10,447,149 males in 1838)—the remainder being "state peasants" (9,104,901 males in 1858, exclusive of the Archangel government) and "domain peasants" (842,740 males the same year).

The serfdom which had sprung up in Russia in the 16th century, and became consecrated by law in 1609, taking, however, nearly one hundred and fifty years to attain its full growth, was abolished in 1861. This act liberated the serfs from a yoke which was really terrible, even under the best landlords, and from their position it was obviously an immense benefit. But it was far from securing corresponding economic results.

The household servants or dependents attached to the personal service of their masters were merely set free; and they entirely went to reinforce the town proletariat. The peasants proper received their houses and orchards, and allotments of arable land. These allotments were given over to the rural commune (mir), which was made responsible, as a whole, for the payment of taxes for the allotments. For these allotments the peasants had to pay, as before, either by personal labour or by a fixed rent. The allotments could be redeemed by them with the help of the crown, and then they were freed from all obligations to the landlord. The crown paid the landlord in obligations representing the capitalized rent, and the peasants had to pay the crown, for forty-nine years, 6% interest on this capital. The redemption was not calculated on the value of the allotments of land, but was considered as a consideration of the loss of the commanding position of the serfs; so that throughout Russia, with the exception of a few provinces in the S.E., it was—and still remains, notwithstanding a very great increase in the value of land—much higher than the market value of the allotment. Moreover, many proprietors contrived to curtail seriously the allotments which the peasants had possessed under serfdom, and frequently they deprived them of precisely the parts which they were most in need of, namely, pasture lands around their houses, and forests. The effect of this, craftily calculated beforehand, was to compel the peasants to rent pasture lands from the landlord at any price.

The present condition of the peasants—according to official documents—appears to be as follows. In the twelve central governments they grow, on the average, sufficient rye-bread for only 200 days in the year—often for only 180 and 100 days. One quarter of them have allotments of only 2-9 acres per male, and one-half less than 8-5 to 4-7. The total amount of the allotment necessary to the subsistence of a family under the three-fields system being estimated at 28 to 42 acres. Land necessary for the cultivation of land must be rented from the landlords at fabulous prices. The aggregate value of the allotments in 1871 reaches 185 to 275% of the normal rental value of the allotments, not to speak of taxes for recruiting purposes, the church, roads, local administration and so on, chiefly levied from the peasants. The peasants increase every year for the past 60 years. The million have left their houses; cattle are disappearing. Every year more than half the adult males (in some districts three-fourths of the men and one-third of the women) quit their homes and wander throughout Russia in search of work. A large portion of the peasantry in each region the state of matters is hardly better. Many peasants took the "gratuitious allotments," whose amount was about one-eighth of the normal allotments.

The average allotment in Kherson is only 0-90 acre, and for allotments from 2-9 to 5-8 acres the peasants pay 5 to 10 roubles of redemption tax. The state peasants are better off, but still they are emigrating in masses. It is in the steppe government of this sort that the situation is worst. In the 1st district of the Empire— where the allotments were personal (the mir existing only among the state peasants), the state of affairs does not differ for the better, on account of the high redemption taxes. In the W. provinces, where the mir was valuable, and the allotments increased after the Polish insurrection, the general situation might have been not for the former misery of the peasants. Finally, in the Baltic provinces nearly all the land belongs to the German landlords, and these have given their allotments to hired labourers, or let it in small farms. Only one-fourth of the peasants are landlord, the remainder being mere labourers, who are emigrating in great numbers.

The situation of the former serf-proprietors is also unsatisfactory. Acustomed to the use of compulsory labour, they have failed to accommodate themselves to the new conditions. The millions of roubles of redemption money received from the crown have been spent without any real or lasting agricultural improvements having been affected. The forests have been sold, and only those landlords have succeeded in making any good impression on their allotments but the peasants could not live upon their allotments. During the years 1861 to 1892 the land owned by the nobles decreased 30% or from 210,000,000 to 150,000,000 acres; during the following years an amount of land equal to that which was, however, when the sales have gone on at an accelerated rate, until in 1903 alone close upon 2,000,000 acres passed out of their hands. On the other hand, since 1861, and more especially since 1882, when the allotment laws were enacted, landlords have passed the title of land, and in 1906, to peasants who were desirous of purchasing land, the former serfs, or rather their descendants, have between 1883 and 1904 bought about 19,500,000 acres from their former masters. There has been an increase of 20% of well-capitalized small proprietors. With the general impoverishment of the mass of the people, and the peculiar nature of the mir, framed on the principle of community of ownership and occupation of the land, was not conducive to the growth of special efforts. The Tsar, or emperor Nicholas II promulgated a provisional ukaz permitting the peasants to become freeholders of allotments made at the time of emancipation, all redemption dues being remitted. This measure, which was enforced by imperial Duma in an act passed on 21st of December 1908, is calculated to have far-reaching and profound effects upon the social and economic conditions of the peasantry. Thirteen years previously the government had endeavoured to secure greater fixity and more permanent residence on the land by a law passed in 1893. In little more than four years from the date of the ukaz of November 1906 it had provided that the various strips of land held by the peasant were to be purchased by the Duma, however, on the advice of the government, it was decided to the future, as an ideal that could only gradually be realized. The co-operative spirit of the Great Russians shows itself in another sphere in the artel, which has been a prominent feature of Russian life since the dawn of history. In the rural artel there is very much resemblance to the co-operative society of W. Europe, with this difference that it makes its appearance without

2 It was only as late as 1904, however, that the landed proprietors were forbidden by law to inflict corporal punishment upon the peasants.

any impulse from theory, simply as a spontaneous outgrowth of popular life. When workmen from any province come, for instance, to St. Petersburg to engage in the textile industries, or to work as carpenters, masons, &c., they immediately unite in groups of ten to fifty persons, settle in a house together, keep a common table, and pay each his part of the expense to the elected elder of the artel. All over Russia there is a network of such artels—in the cities, in the forests, on the banks of the rivers, on journeys and even in the huts of the peasants.

The industrial artel is almost as frequent as the preceding, in all those trades which admit of it. Artels of one or two hundred carpenters, bricklayers, &c., are common wherever new buildings have to be erected, or railways or bridges constructed; the contracts for such work are always dealt out among the artels, the separate workmen. It is needless to add that the wages divided by the artels are higher than those earned by isolated workmen.

Finally, a great number of artels on the stock exchange, in the seaports and large towns, where much accommodation is required, have grown up, and have acquired the confidence of traders; people to such an extent that considerable sums of money and complicated banking operations are frequently handed over to an arteshnik (member of an artel) without any receipt, his number or his being accepted as sufficient guarantee. These artels are recruited only on personal acquaintance with the candidates for membership. Cooperative societies have also been organized by several communities; they have achieved good results, but do not exhibit, on the whole, the same unity of organization as those which have arisen in a natural way among the peasants and artisans.

The chief occupation of approximately seven-eighths of the population, namely, agriculture, varies considerably according to the soil, the climate and the geographical position of the different regions. A sinuous line drawn from Zhitomir via Kiev, Tula and Tiflis to the Caspian Sea would mark off the "northern" soils from the "southern" soils. To the north of this line, as far as the sandy deserts of Astrakhan and the steppes of N. Caucasus, lies the "black earth" region. Broadly speaking, the forests here yield to steppes, and the soil is very fertile; but the products of the land are more liberal on the grey and brown soils, which are glacial deposits more or less redistributed by water, are much less fertile as a rule, and consist of all possible varieties from a tough boulder clay to loose sand. Both N. and S. of this line, the middle region, is a plateau of broad valleys, generally, parallel to it, and differentiated chiefly by climatic differences. In the tundras of the extreme N. agriculture does not exist; the reindeer constitutes the principal wealth of the nomads of the Yamal and Tannu-Uul. In the wheat, rye, and flax tundras, which extends over an area of more than 500,000 sq. m., agriculture is carried on with great difficulty, not only because of the infertility of the soil, but also because of the severity of the climate. In the forest, the chief crop is rye, while in the steppes, wheat is grown, although potatoes are extensively grown in the forest, though the yield is poor. S. of 60° N. agriculture becomes the predominant industry, while the exploitation of the forests plays only a secondary role. In this zone, which extends over an area of nearly 600,000 sq. m., and on the T. the agricultural produces vary. Crops, chiefly barley, rye, and potatoes, are grown, and there is a large cultivation of potatoes, which are grown from a very early date. Barley, oaten, and oats, with barley and wheat coming next, though flax and green crops are also grown. Cattle have to be housed for the winter. In the W. of this zone, that is in the Baltic provinces, the climate is less severe as well as moister. Agriculture is carried on in a more intelligent manner, and the yield is higher. Flax is almost of much importance as wheat, and the potato is more cultivated than in any other part of Russia. Hardy fruit trees, and live-stock are reared. The Flax and Tobacco are the largest industries. In the S. of this zone, the climate is more temperate, but agriculture is more backward than in the Baltic provinces. The three-field system of cropping a patch of land until its fertility is exhausted is followed even now in some regions. In the S. condition, is still pursued, and both landowners and peasantry suffer from want of capital and lack of agricultural training. Flax is one of the principal exports of this region, timber being another.

In the S. of the country, wheat, rye, and barley become the principal crops, with potatoes, barley, oaten, and oats, with barley and wheat coming next. Flax and green crops are extensively grown in the summer, and agriculture is consequently carried on under greater difficulties. One of the most serious of these is caused not by the unfavourable character of the climate but by the shortage of labour. Since the emancipation of the serfs, the larger estates of the landlords of Russia have in large numbers drifted away into the black earth zone, or to have gone to the factories. The methods of agriculture are still unscientific and unprogressive. Rye is the staple crop, though buckwheat, flax, green crops, and the potato are extensively grown. This is especially the case in the W. of the black earth zone, that is in the governments of Kiev, Podolia, Poltava and in part of Kharkov. The winters are less severe, and modern agricultural machinery is generally employed, at all events on the larger estates.

In consequence of these more favourable conditions there is greater variety in the crops; a good deal of wheat is grown, as well as beetroot for sugar, fibre plants and oleaginous plants, fruit, and even (W. of the Dnieper) the vine. Live-stock breeding is likewise in a more prosperous condition. The best of the black earth zone, which stretches from these governments N.E. to the Volga, is less favoured by nature; the winters are longer and more inclement, and droughts are not uncommon. When this happens there is great scarcity of rye, for which the crop upon which the people principally depend, though rye, buckwheat and oats are also cultivated. But a long course of continuous cropping with these grain crops, without affording compensation to the soil in the form of manure or deep cultivation, has so exhausted it that its productiveness has sadly decreased. The consequence is that the peasantry are constantly in a state bordering on destitution, and exposed to the horrors of famine, like those which visited them in 1890 and 1898, and threatened in 1907.

In the above zone lying to S. of the Steppes, in the S., in Bessarabia, the three chief products are maize, wine and hardy fruit, especially plums. Here the climate is temperate and fairly mild, but farther E. it is distinctly more arid. Wheat is the principal crop, with barley second. Water-melons, sun-flowers and flax, both the last two for oil, are usual crops. But the breeding of horses and sheep is of equal importance with agriculture. Here again both capital and labour are short, and the cultivation of the soil suffers from wants that, owing to the absence of timber, the steppes conditions extend over the greater part of the Crimea and up to the foothills of the Caucasus. The actual distribution of arable land, forests and meadows, in European Russia and Poland is shown in the following table:—

Down to January 1st 1903, the peasants had actually redeemed out of the land allotted to them in 1861 a total of 280,530,616 acres. In Poland the distribution of landed property is divided among the large estates, thus assigned to them by the government, bought some 2½ million acres since 1863, and of this quantity they purchased no less than 1,600,000 acres, or 64% of the whole, between 1863 and 1905. In 1860, however, there is in most years a surplus available for export. Out of the total acreage under cereals 34% is generally sown with rye, 26% with wheat, 20% with oats and 11% with barley. In the S. of European Russia, and Poland, almost exactly two-thirds of the total area is sown every year with cereals. But generally in 18 from 33 out of the 72 governments in European Russia (including Caucasus) and Poland the yield of cereals is not sufficient for the wants of the people. In 30 to 40 governments, however, there is in most years a surplus available for export. Out of the total acreage under cereals 34% is generally sown with rye, 26% with wheat, 20% with oats and 11% with barley. Flax and hemp occupy considerable areas in central and N.W. Russia. The yield of hemp is cultivated as far N. as 49° N. (in Bessarabia, Crimea, Don Cossack territory and Caucasus), the annual production of wine amounting to 35-50 million gallons, three-fifths in Caucasus. Market-gardening and fruit-growing are profitable occupations in certain parts of S. and central Russia, and have led recently to the establishment
of factories for canning fruit and for making jam and pickles. Transcaucasia supplies, chiefly from the government of Erivan, some 12,000 tons of raw cotton annually. The tea plant thrives and is being planted fairly rapidly on the Black Sea littoral in Transcaucasia.

Live-stock are diminishing in numbers all round: in the case of horses, from 21 per 100 inhabitants in 1882 to 17 per 100 inhabitants in 1904; of cattle, from 31 in 1851 to 23 in 1882 and 27 in 1904; of sheep, from 56 to 49; and of goats, from 41 in 1882 to 32 in 1904, and down to 29 in 1906. Recent investigations in the government of Moscow have revealed that 40% of the peasant households possessed no horses, and similar inquiries in 41 governments elicited the fact that 28% of the peasant households had no cattle at all, although in the country 82% belong to the peasantry. The animal commonly met with is small and possessed of very little strength; the best are those of Poland, the W. governments and the S. steppe. The former has from 13 to 15 millions of cattle, and this race of S. Russia is fine animals, and those of the Kirghiz, though not big, are famous for their endurance. Finland ponies are exported in large numbers. The best bred races of cattle are those of Poland, the W. provinces, Little Russia and the Carpathian.

Both the horses of the Cossacks and the steppe pony are remarkable for their cheapness. The horse, kept in the former is 892.50 pence, but the price in the latter is 3 pounds. The 55 million sheep kept in Russia only about 15 millions belong to the fine merino breed, and these are pastured chiefly on the Black Sea steppes. Modern dairy-farming is only just beginning in Russia, but butter and cheese are becoming rather possible. The population is increasing rapidly; and although since the emancipation of the peasants the average annual export of cereals has decreased from 160,000,000 to 70,000,000, the result has been attained largely by decreased cropping to exhaustion of the soil. To the cultivators, whether noble or peasant, have not profited much from the change in their economic circumstances brought about by the social emancipation of 1861. Agriculture suffers from the widespread poverty of the agricultural classes, from the relative backwardness of the peasantry, which weighs unjustly upon the peasantry, from their lack of education, their technical ignorance and national indolence, and from the absence of those progressive institutions (e.g., co-operative banks) by means of which the peasantry can be made better by the Ministry of Agriculture and by the more enlightened of the zemstvos to improve the education of the peasantry, but the progress achieved has been small. The methods adopted by the zemstvos for improving agriculture, either on the initiative of the government or of the founders of agricultural councils, the appointment of inspectors, and the founding of museums, meteorological stations and depots for the sale of agricultural machinery. Measures are being taken by the government to increase the very low productivity of the farms.

The distribution of forests is very unequal, the area covered by them in the various governments varying from 70% of the total area in the Ural governments of Perm and Ufa, and 68% in Orenburg and Archangel, down to 2% in the S.E. The state is the chief owner of forests (almost exclusive owner in Archangel), and owns no less than 28,000,000 acres (235,000,000 acres of good forests), while private persons own 171,800,000 acres, the peasant communities 67,250,000, and the imperial family 22,400,000 acres.

Sericulture, which was in a flourishing condition in the sixties both in Caucasus and in S. Russia, was reduced to a very low ebb in consequence of the silkworm disease, and was only renewed with any vigour towards the end of the eighties. At the beginning of the 20th century it was most developed in Transcaucasia (Kutais, Elisavetpol), and extended into N. Caucasia. Sericulture is taught in a number of special schools and in a great number of village schools. Attempts are being made to re-establish the silkworm farming in the districts of the Volga. In addition to the traditional sericulture, which provides a large part of the raw silk, the cultivation of the mulberry has been started in some of the less populated regions of the empire.

Notwithstanding the wealth of the country in minerals and manufactures, the home market is too small for the home production, and the government is actively engaged in the encouragement of foreign trade, including the imposition of protective tariffs even against Finland (in 1885), this and the related industries are still at a low stage of development. The remoteness of the mining from the industrial centres, the lack of technical instruction and of capital, the existence of vexatious regulations, aggravated by the disturbed condition of the country, which hinders credit and enterprise, are amongst the chief reasons for this. The imports of foreign metals in the form of ore and coal steadies imports, and the exports, never otherwise than insignificant, show no advance. A producer of iron Russia nevertheless runs France neck and neck for the fourth place amongst the iron-producing countries of the world. In 1882, the annual output had been 900,000 tons, in 1891 to 2,808,000 in 1901; and to 2,000,000 in 1904. The two principal mining centres of European Russia are the Ural, Ekaterinoslav, Kharkov and the Don Cossacks territory. The Ural ironiferous rocks are, the older and are worked by primitive methods. The country is now covered by woodland being largely used for fuel, and the ore and metals being transported by water down the Kama and other rivers. The minerals chiefly produced in the Ural is iron, coal, gold, platinum, and manganese. The output of coal in the Ural is the highest in the world and has doubled between 1890 and 1900, increasing from 446,800 tons in the former to 1,460,800 in the latter; but since 1900 the output has declined, the total for 1904 (inclusive of Siberia) being 644,000 tons. The output of iron in the same year was 2,248,000 tons, and that of manganese 30,000 tons having been the total in 1891, and 72,000 tons the total in 1900. Gold has been mined in the Ural since 1820; but since 1892 the output has fallen off very considerably. Whereas in the latter the yield amounted to 395,000 oz., in 1900 it was only 210,000 oz. The output of platinum in the Ural is also small. Iron comes from the Ural, but the total output only ranges between 10,000 and 10,000 lb annually. The copper industry is still in its infancy, the output of copper in the Ural is about 36,000 lb annually. The mining region of S. Russia is much more important. It is of comparatively recent foundation (1860), and is carried on largely with French and Belgian capital, with modern appliances and with modern methods. The production of pig-iron is now 1,200,000 tons annually, that of pig-iron produced annually in the whole of the Russian empire, 61% is produced in the basin of the Donets, and out of a total of 1,000,000,000 tons of worked iron and steel 48.7% are produced in the Ural, 17.8% in the black earth region, and 2% in the Urals. The iron and steel is the government, for its railways, locomotives, wagons, arsenals, artillery, &c. The output of coal in the Russian empire has increased from a total of less than 300,000 tons in 1850 to 1,920,000 tons in 1904, and to 2,620,000 tons in 1906.

The mining region itself is the richest in the Russian empire in respect of coal and iron. The iron mines are worked in the Ural, where the production doubled or trebled. Manufacturing industry in the modern sense can hardly be said to have existed in Russia

See Russian Journal of Financial Statistics, in English (2 vols., St Petersburg, 1901)

---

**Industries**

**Russia**

The prosperity of the manufactures is due to the following causes: the great extent of the empire, the vast wealth of its resources, the large demand for manufactured goods in the interior, the arrangement of the industrial system, and the facility of water communication. The manufactures are chiefly those of the Ural, but also of the Volga and of the Black Sea.

The manufactures of the Ural are the most important, and include the production of iron, coal, and steel. The iron industry is the most important of the manufactures, and is carried on in the Ural, in the Black Sea, and in the Volga basin. The coal industry is also important, and is carried on in the Ural, in the Black Sea, and in the Volga basin. The steel industry is also important, and is carried on in the Ural, in the Black Sea, and in the Volga basin.

The manufactures of the Volga are also important, and include the production of cotton goods, woolen goods, and leather goods. The cotton industry is the most important of the manufactures, and is carried on in the Volga, in the Black Sea, and in the Ural.

The manufactures of the Black Sea are also important, and include the production of cotton goods, woolen goods, and leather goods. The cotton industry is the most important of the manufactures, and is carried on in the Black Sea, in the Volga, and in the Ural.

The manufactures of the Ural, Volga, and Black Sea are all important, and include the production of iron, coal, steel, cotton goods, woolen goods, and leather goods. The iron industry is the most important of the manufactures, and is carried on in the Ural, in the Black Sea, and in the Volga basin. The coal industry is also important, and is carried on in the Ural, in the Black Sea, and in the Volga basin. The steel industry is also important, and is carried on in the Ural, in the Black Sea, and in the Volga basin. The cotton industry is the most important of the manufactures, and is carried on in the Ural, in the Black Sea, and in the Volga basin. The woolen industry is also important, and is carried on in the Ural, in the Black Sea, and in the Volga basin. The leather industry is also important, and is carried on in the Ural, in the Black Sea, and in the Volga basin.
RUSSIA

... before the 10th century, that is to say, industries carried on with capital and machinery in large factories. Industry of this character was first established in Russia in 1820, and it has grown there rapidly, though not so rapidly as during the last few years of the 19th century. The principal centre of industry in the Government of Piotrkow, the staple industry being cottons. A great many factories have sprung up also in Warsaw and at Sozonowice and Bendzin in the extreme S.W. corner of Poland. Besides cotton the products include woollens and cloth, silks, chemicals, machinery, ironware, beer, and tobacco.

The peculiar feature of Russian industry is the development out of the domestic petty industry of rural Russia. A factory on a large scale. Owing to the forced abstention from agricultural labour in the winter months the peasants of central Russia, more especially those of the governments of Moscow, Vladimir, Yaroslavl, Kostroma, Tver, Smolensk and Ryazan, have for centuries been accustomed to supply the work of the period of compulsory leisure. The usual practice was for the whole of the people in one village to devote themselves to one special occupation. Thus, while one village would produce nothing but shoes, another would produce sacred images (ikon), and a third spin flax only, a fourth make wooden spoons, a fifth nails, a sixth iron chains, and so on. In the same way certain communities became famous for certain commodities, as Moscow for Osborne hats, Odessa for flower baskets, Vologda for linden and lace, and for wooden utensils, toys, wooden spoons, cups and bowls, basket, mats and mats, baste boots and garden products; Yaroslavl for furniture, brass samovars, saucepans, spurs, rings, etc.; Vladimir for fur cloaks; and Nizhni-Novgorod for bast mats and sacks, knives, forks and scissors; Tver for lace, nails, sieves, anchors, fish-hooks, locks, coarse clay pottery, saddlery and harness, boots and shoes, and so on. Out of these have grown large factories, employing as many as 10,000 to 12,000 men, and in the beginning when harvest comes they leave the factories and repair to their fields, and meantime the factories stand still for two or three months. Nor do the people work on the holidays of the church, the number of days they lose in this way amounting to nearly one-third of the whole year. Hence, although wages are painfully low, the cost of production to the manufacturer is relatively high; and it is still further increased by the cost of the raw materials, by the heavy rates of transport owing to the distance from the factories to the centre of production, and by the supply of fuel.

As a consequence this central Russian industry, even when supported by very high protective duties, is only able to produce for the home market and the markets of the adjacent territories in Asia and the northern parts of the Baltic. In Europe, wood is the principal product; and the remarkable growth of the industry is illustrated by the fact that, whereas in 1843 there were only 350,000 spindles at work, fifty years later there were 4,332,000 employed, and in 1900, 6,554,600. The number of looms increased from 10,884 in 1850 to 52,880 in 1900. The chief raw materials are cottons, woolens, silk, cloth, chemicals, machinery, paper, furniture, hats, cement, leather, glass and china and other products. From the governments of Vyatka and Vladimir large numbers of bricklayers, carpenters and other handicraftsmen migrate temporarily to the S. governments every year, and similarly plasterers and painters from the government of Moscow.

The growth of Russian industry is set forth in the following table, which compares the number of workers in 1889, 1897 and 1902, of all factories throughout the empire of which the annual production was valued at more than £20—

<table>

</tbody>
</table>

With regard to Russian industry generally, the extravagant prices which have to be paid for iron and all iron goods, owing to the prohibitive tariffs, combined with the obstacles put in the way of education, have a very detrimental effect. The cotton factories excel chiefly in the production of red and printed cottons. In the flax-mills the tendency is to produce the finest textures as well as the coarser. The silk-mills employ silk obtained from the Caucasus, Italy and France. The growth of the sugar industry is shown by the fact that in 1888-93 the average importation of sugar was 2,444,300 tons, in 1902-3 it was 1,180,929 tons. Since 1894 the government has had a monopoly in retailing spirituous liquors, but not wine or beer; but distilling, a very widespread industry, is left in private hands. Beer is chiefly brewed in Poland and the Baltic provinces. Tanneries exist sufficiently well, but leather is chiefly imported to Warsaw and St Petersburg, and after these at Moscow, that the largest and best modern tanneries and shoe and glove factories are established.

The governments of Orel (shoe factories), Kherson, Voronezh, Astrakhan and Tula are remarkable in this respect. Furniture factories are developing greatly, as is the paper industry. Flour-mills play an important part in the general industry of Russia, and there are several tobacco and hemp factories.

Far from being destroyed by the competition of the "modern" factories, domestic industries have well maintained their ground, new branches of petty trade having sprung up in some districts, among them the manufacture of agricultural machinery (thresher machines of 2½% Vyatka and Perm; ploughs in Smolensk, &c.)

The wealth of Russia consisting mainly of raw produce, the trade of the country turns chiefly on the purchase of this for export, and the production of which in Russia for home consumption is in exchange. This traffic is in the hands of a great number of middlemen,—in the W. Jews, and elsewhere Russians,—to whom the peasants are for the most part in debt, as they purchase in advance a considerable part of their annual payments in corn, hay, wooden wares, &c. A good deal of the internal trade is carried on by travelling merchants.

The fairs are very numerous. Those of Nizhni-Novgorod, with a return of 20 million sterling, of Ibit and Kharkov, of Minsk and Lida, and Omsk and Bashkortostan, have considerable importance both as an outlet for trade and for home manufactures. Altogether, no fewer than 16,000 fairs are held in Russia, 85% of them in European Russia. Of these, 30 show returns of goods imported and exported in the year 1902 as follows:—

<table>

The exports rank in the following order:—cereals (wheat, barley, rye, oats, maize, buckwheat) and flour, 49-3%; timber and wooden wares, 7-2%; petroleum, 5-8%; eggs, 5-4%; flax, 5-4%; butter, 3-9%; cottons and oilcake, 2-0%; oilegans, 2-0%; hemp, 2-5%; spirits, 2-0%; poultry, game, breads, hair, furs, leather, hemp goods, industrial spirits, among which wines, 5-4%; tobacco; 7-4%; and wood and spirit, 2-0%. The countries from which Russia buys most extensively are Germany (34%), France, Italy, Finland, Belgium, Austria-Hungary, Denmark, Turkey and Sweden. The commodities which the United Kingdom principally takes are wheat, wool, barley, eggs, oats and flax. With regard to the imports into Russia—they consist mainly of machinery, raw materials, chemicals, and wood and paper. The main provisions, the principal items being raw cotton, 17% of the aggregate; machinery and metal goods, 13% tea, 5% mineral ores, 5% gums and resins, 4% wool and woollen yarns, 3% textiles, 3% leather, 3% silk dyestuffs, 2% wine and spirits, fruits, coffee, tobacco and rice. The countries from which Russia buys most extensively are Germany (34%), the United Kingdom (15%) and the United States (9%).

Machinery, coal, iron, woollens, ships, lead and copper are the commodities which the United Kingdom principally takes is wheat, wool, barley, eggs, and flax. The total mercantile marine of Russia does not aggregate 700,000 tons; and it is distributed in the following proportions: 35% in the Caspian Sea, 24% in the Black Sea and 24% in all other parts, and 17% in the Mediterranean Sea and the White Sea. And these proportions represent fairly well the tonnages entering and clearing at the ports of these respective seas. But of the vessels that visit the Russian ports in the way of trade every year only 5% are Russian, the rest being of course Russian. Russian craft play, however, a much more important part in the internal traffic, the traffic on which increases rapidly, e.g. whilst in 1894 it amounted to an aggregate of 23,293,400 tons, in 1904 it reached a total of 36,720,240, or an increase of more than one-third during the same period.
crews increased 19%, the number of men employed in the latter year being approximately 150,000.

In 1860 Russia possessed less than 1,000 miles of railways; by 1885 this had increased to 16,155 miles, and by the middle of 1905 there were 107,387 miles of railways, of which 51,181 miles were wholly state owned. Between 1895 and 1905 the building of railways proceeded at a rapid rate, the total length of line being doubled within this period. As a means of providing a better road over the 40,000 miles of railways, a charge of £410 per mile to construct, and the Asiatic railways 5,092 per mile.

A considerable number of new railways, some of great strategical and commercial importance, were constructed during the last 20 years. This was the same period in which state railways built by local companies were termed state railways, although several of the later lines, while imperative for state purposes, must necessarily yield but a very small revenue, or be worked for a loss. The most important of the new railways is the Siberian of which the first section, Chelyabinsk to Omsk, was opened in December 1895, and which, except for a short section around Lake Baikal, in 1901 was completed right through to Stryzensk, on the Shika; the head of navigation on the Shika and the Amur, 270 miles from the Sea of Japan. The railways along the Volga, which are of great importance to Siberia and Chelyabinsk, the section round the S. end of Lake Baikal was completed in 1905. At the Pacific end of the Siberian railway a line connecting Vladivostok with Harabarovsk (479 miles) was completed in 1905. The junction of this line with the Trans-Siberian railway at the lower Shika and upper Amur, nor the marshy, often inundated region between Khabarovsk and the Little Khingan mountains, could ever be the seat of a populous population. Consequently a section of the Siberian railway, built between 1895 and 1905, was as a part of the agreement concluded with the Chinese government, a railway from Vladivostok through Manchuria to Korymskaya near Chita in Transbaikalia. This runs for 222 miles on Russian territory and for 1080 miles on Manchurian territory, and was opened in 1900. The railway from the Dalny near Port Arthur on the Liao-tung peninsula. The first portion of the Manchurian railway, built by Russian engineers, with Chinese labour, was finished in 1902. At the same time several branches of the Manchurian railway are in course of construction. 

Chelyabinsk is linked by a transverse line with the middle Urals railway, which connects Perm, the head of navigation in the Volga basin, with Tyumen, the head of navigation on the Ob and Irtysh, passing through Ekaterinburg and other mining centres of the middle Urals. Tomsk is now connected with the main line by a short branch. The railway has also been built to connect Perm with Kollas, near the confluence of the Sukhona with the Ular, at the middle of the Volga river, and to Tashkent. The whole railway system was further completed by the opening in 1906 of a line from St Petersburg via Vologda to Vyatka, intersecting the Moscow-Archangel line at Vologda.

A third line of great importance was built across the Transcaucasian territory to Ferghana. Starting from Krasnovodsk, it runs S.E. to Merv (560 m.), with a branch line (194 m.) to Kushk, near Herat, then N.E. across the desert to Charjou, on the Amur river, Bokhara and the Russian frontier to Samarkand, Kokand and Andijan in Ferghana, 710 m. from Merv, with a branch to Tashkent (220 m.). This railway has important for the export of raw material from Central Asia to Russia. In 1878-1880 the lease of this line was acquired by the State, and surrendered to the Russian State. Small branch lines were built from the Sary-darya to Kazakh, and thence to Orenburg.

A third line of great importance is the junction line between the Transcaucasian railway—which runs from Batum and Poti to Baku, via Tbilisi, Tiflis and Tiflis, and the railway line to the Russian proper. This junction has been effected not along the main Caucasion range, but at its E. extremity, that is, via the Caspian ports of Baku and Petrovsk, which are connected with Vladikavkaz (Beslan junction). The Black Sea port of Novorossiysk, in W. Caucasus, having been connected with the Rostov-Vladikavkaz line, has consequently also been brought into touch with the Russian railways. The Volga is reached from central Russia by seven lines of routes: four, including that to Kazan, which have been made direct from the Volga E. (one to Siberia and two to the Ural river), while the upper Volga (Yaroslavl) is connected with Archangel by a line 523 m. long. A zone tariff was introduced on the Russian railways in 1894, and this introduced from the line of the Volga is 523 m. can be made third class at a cost of only about 17 shillings, while for less than twice as much 1900 m. can be covered.

Fish form an important article of national food. The numerous fish of the national church prescribe a fish diet on many days in the year, and the continuous frost of winter is favourable to the transportation of fish for great distances. Along the Murman coast of the Arctic Ocean and in the White Sea, where many millions of herrings are caught annually by some 3000 persons, the yearly produce is estimated at the value of £140,000. In the Baltic Sea, as well as in the lakes of its basin (Ladoga, Onega, Ilmen, &c.), the yearly value is estimated at £200,000. Of anchovies alone, captured in Russia, is, next after flour and bread, the staple food of large masses of the population. The Black Sea fisheries, in which about 4000 men are engaged, yield fish valued at £500,000 per annum. The value of the fish has much risen in the last 20 years, in consequence of the employment of the method of packing, fish is now exported in a fresh state from the Black Sea to all parts of S.W. Russia, and even to Moscow. The annual yield of the Azov Sea fisheries, occupying an area of 6000 square miles, is valued at £600,000, while the Volga section of the Caspian Sea fish are caught to the value of about £1,000,000 annually; in the Urals section over 40,000 tons of fish and nearly 1500 tons of caviare are obtained. The total value of the Caspian fisheries is estimated at over £1,500,000. The fisheries of the Siberian river fisheries into account, it is estimated that altogether the fishing industries yield a revenue to the state of £53,000 annually. In addition from 13,000 to 60,000 seals and about 200 whales are killed annually off the Murman coast. Hunting is an occupation of considerable importance in N. and N.E. Russia, and along the shores of the Arctic Ocean.

"The Russkii Encyklopedicheskiy Slovar, edited by Broekhuys and Efron, was begun in 1890, with the idea of giving a Russian version of Brockhauser's Conversations Lexikon, but from the very first volumes it became a monumental encyclopedia, and is, indeed, an inexhaustible source of information on everything. The work is divided into sections, general geographical and political sections, sections containing geographical, geological and other descriptions of separate regions, and very well-chosen illustrations, was begun in 1899 under the editorship of V. P. Semenov. La Russie à la fin du xixe siècle, by W. Schmidt, is an exceptionally valuable pamphlet. See also H. Norman, All the Russians (London, 1892); Sir D. Mackenzie Wallace, Russia (2 vols., new ed., 1905, London); A. Leroy-Beaulieu, L'Empire des tsars (3 vols., Paris, 1891); H. W. Trans., The Russkiy Russland (Leipzig, 1895); R. Martin, The Future of Russia (Eng. trans., London, 1906); M. M. Kovalevsky, Russian Political Institutions (Chicago, 1902)."

History of the History of Russia may be conveniently divided into four consecutive periods: (1) the period of Independent Principalties; (2) the Mongol Domination; (3) the Tsardom of Muscovy; and (4) the Modern Empire.

1. A Conglomeration of Independent Principalties.—The first period, like the early history of many other countries, begins with a legend. Nestor, an old monkish chronicler of Kiev, relates that in the middle of the 9th century the Slav and Finnish tribes inhabiting the forest region around Lake Ilmen, between Lake Ladoga and the upper waters of the Dnieper, paid tribute to military adventurers from the land of Rics, which is commonly supposed to have been a part of Sweden. In the year 859 these tribes expelled the Northmen, but finding that they quarrelled among themselves, they invited them, three years later, to return. Conquering with the aid of the Danes and Swedes they established a state which, while not great, is fertile, and there is no order in it; come and reign and rule over us. Three brothers, princes of Rics, called respectively Rurik, Sineus and Truvor, accepted the invitation and founded a dynasty, from which many of the Russian princes of the present day claim descent.

Who were those warlike men of Rics who are universally recognized as the founders of the Russian Empire? This question has given rise to an enormous amount of discussion among learned men, and some of the disputants have not yet laid down their arms; but for impartial outsiders who have carefully studied the evidence there can be little doubt that..."
the men of Rūs, or Væriagœ, as they were sometimes called, were simply the hardy Norsemen or Normans who at that time, in various countries of Europe, appeared first as armed marauders and then lived in the invaded territory as a dominant military caste until they were gradually absorbed by the native population. Lake Ilmen and the river Volkhov, on which stands Novgorod, Rurik’s capital, formed part of the great waterway from the Baltic to the Black Sea, and we know that by this route travelled from Scandinavia to Constantinople the tall fair-haired Northmen who composed the famous Varangian bodyguard of the Byzantine emperors.

The new rulers did not long confine their attention to the tribes who had invited them. They at once began to conquer the surrounding country in all directions, and before two centuries had passed they had established themselves firmly at Kiev on the Dnieper, invaded Byzantine territory, threatened Constantinople with a fleet of small craft, obtained as consort for one of their princes, Vladimir I, (q.v.), a sister of the Byzantine emperor on condition of the prince becoming a Christian, adopted Christianity for themselves and their subjects, learned to hold in check the nomadic hordes of the steppe, and formed matrimonial alliances with the reigning families of Poland, Hungary, Norway and France. In short, they became a considerable power in eastern Europe, and might be regarded as one of the claimants for the inheritance of the decrepit East Roman Empire. Unfortunately for the political future of this new state, its internal consolidation did not keep pace with its territorial expansion. In theory the whole Russian land was a gigantic family estate belonging to the Rurik dynasty, and each member of that great family considered himself entitled to a share of it. It had to be divided, therefore, into a number of independent principalities, but it continued to be loosely held together by the dynastic connections of the descendants of Rurik and by the patriarchal authority—a sort of patriarch potestas—of the senior member of the family, called the grand-prince, who ruled in Kiev, “the mother of Russian cities.” His administrative authority was confined to his own principality, but when territorial disputes arose between two or more of his relations, his paternal influence was exercised in the interests of peace and justice. What added to the practical difficulties of this arrangement was that the post of grand-prince was not an hereditary dignity in the sense of descending from father to son, but was always to be held by the senior member of the dynasty; and in the subordinate principalities the same principle of succession was applied, so that reigning princes had to be frequently shifted about from one district to another, according as they could establish the strongest claim to vacant principalities. What constituted in this primitive system of inheritance the strength of a claim was often not easily determined, and even when the legal question was clear enough the law was not always respected by the contending parties. Hence family quarrels became very frequent, and the Russian people, in some instances, turned against themselves, and acted as powerful men generally do in a rude state of society. Instead of conforming to abstract principles of public law and hereditary succession, they strove to enlarge their territories at the expense of their rivals, and to leave them at their death to their sons rather than to their brothers, nephews and more distant relations. In these circumstances, the traditional authority of the grand-prince, never very great, rapidly declined, and the complicated law of succession, never scrupulously respected, was gradually replaced by “the good old rule, the simple plan, that he should take who has the power, and he should keep who can.” Yaroslav, surnamed the Great, a man of commanding personality, was the last grand-prince who upheld vigorously the old system. After his death in 1054 the process of disintegration went on apace and the family feuds multiplied at an alarming rate. During the next 170 years (1054–1224) no less than 64 principalities had a more or less ephemeral existence, 293 princes put forward succession-claims, and their disputes led to 83 civil wars.

During these interminable struggles of rival princes, Kiev, which had been so long the residence of the grand-prince and of the metropolitan, was repeatedly taken by storm and ruthlessly pillaged, and finally the whole valley of the Dnieper fell a prey to the marauding tribes of the steppe. Thereupon Russian colonization and political influence retreated northwards, and from that time the continuous stream of Russian history is to be sought in the land where the Vikings first settled and in the adjoining basin of the upper Volga. Here new principalities were founded and new agglomerations of principalities came into existence, some of them having a grand-prince who no longer professed allegiance to Kiev. Thus appeared the grand-prince of Suzdal or Vladimir, of Tver, of Ryazan and of Moscow—all irreconcilable rivals with little or no feeling of blood-relationship. The more ambitious and powerful among them aspired not to succeed but to subdue the others and to take possession of their territory, and the armed retainers, who were wont formerly to wander about as free lances, gave up their roving mode of life, settled down permanently in one principality, became landed proprietors, and sought to share as boyars the princes’ authority.

Among the principalities of that northern region the first place was long held by Novgorod. Since the days when Rurik had first chosen it as his headquarters, the little town on the Volkov had grown into a great commercial city and a member of the Hanseatic league, and it had brought under subjection a vast expanse of territory, stretching from the shores of the Baltic to the Ural Mountains, and containing several subordinate towns, of which the principal were Pskov, Novzhny-Novgorod and Vyatka. Unlike the ordinary Russian principalities, it had a republican rather than a monarchical form of government. Indeed, it was not so much a principality as a municipal republic of the Venetian type. It always had a prince, no doubt, but he was engaged by formal contract without much attention being paid to hereditary rights, and he was merely leader of the troops, while all the political power remained in the hands of the civil officials and the Vetchi, a popular assembly which was called together in the market-place, as occasion required, by the tolling of the great bell. Descendants of Rurik, impregnated with the pride of a dominant military caste, did not much like serving those turbulent, wilful burghees, and some of them, after a time, voluntarily laid down their office and retired to more congenial surroundings. Those of them who tried to have their own way and came into conflict with the authorities had always to yield in the long run, and they were liable to be treated very unceremoniously, so that the vulgar adage, “If the prince is bad, into the mud with him!” became a maxime of state policy.

There was here in the Russian land the germ of republicanism or constitutional monarchy, but it was not destined to be developed. The principality which was to become the nucleus of the future Russian empire was not Novgorod with its democratic institutions, but its eastern neighbour, Moscow, in which these very principles were at last to find a suitable soil, and in which the supreme law was the will of the prince. The opposition which he encountered came not from the burghees but from the boyars and the nobles.

II. The Mongol or Tatar Domination, 1238–1462. — Between Moscow and Novgorod there was a long and bitter rivalry, breaking out occasionally into armed conflicts, and among the princes of the other principalities the old struggle for precedence and territory went on incessantly until it was suddenly interrupted, in the first half of the thirteenth century, by the unexpected irruption of an irresistible foreign foe coming from the mysterious regions of the Far East. “For our sins,” says the Russian chronicler of the time, “unknown nations arrived. No one knew their origin or whence they came, or what religion they practised. That is known only to God, and perhaps to wise men learned in books.” The Russian princes first heard of them from the wild nomadic Polovtsi, who usually pillaged the Russian settlers on the frontier, but who now preferred...
friendship and said: "These terrible strangers have taken our country, and to-morrow they will take yours if you do not come and help us." In response to this call some Russian princes formed a league and went out eastward to meet the foe, but they were utterly defeated in a great battle on the banks of the Kalka (1224), which has remained to this day in the memory of the Russian common people. Now the country was at the mercy of the invaders, but, instead of advancing, they suddenly retreated and did not reappear for thirteen years, during which the princes went on quarrelling and fighting as before, till they were startled by a new invasion much more formidable than its predecessor. This time the invaders came to stay, and they built for themselves a capital, called Sarai, on the lower Volga. Here the commander of "the Golden Horde," as the western section of the Mongol empire was called, fixed his headquarters and represented the majesty of his sovereign the grand khan who lived with the Great Horde in the valley of the Don, and the khan of the Tatar character of these terrible invaders we are much better informed than the early Russian chroniclers. The nucleus of the invading horde was a small pastoral tribe in Mongolia, the chief of which, known subsequently to Europe as Jenghiz Khan (q.v.), became a mighty conqueror and created a vast empire stretching from China, across northern and central Asia, to the shores of the Baltic and the valley of the Danube—a heterogeneous state containing many nationalities held together by purely administrative ties and by an enormous military force. For forty years after the death of its founder it remained united under the authority of a series of grand khans chosen from among his descendants, and then it began to fall to pieces till the various fractions of it became independent khanates.

The khanate closely connected with the history of Russia was that of Kipchak or the Golden Horde, the khan of which settled, as we have seen, on the lower Volga and built for themselves a capital "Sarai" with which they had their headquarters and held Russia in subjection for nearly three centuries. The term by which this subjection is commonly designated, the Mongol or Tatar yoke, suggests ideas of terrible oppression, but in reality they were not cruel, oppressive taskmasters as is generally supposed. In the first place, they never settled in the country, and they had not much direct dealings with the inhabitants. In accordance with the admonitions of Jenghiz to his children and grandchildren, they retained their pastoral mode of life, so that the subject races, agriculturists and dwellers in towns, were not disturbed in their ordinary avocations. In religious matters they were extremely tolerant. When they first appeared in Europe they were idolaters or Shamanists, and as such they had naturally no religious fanaticism; but even when they adopted Islam they remained as tolerant as before. Jenghiz, the first khan of the Golden Horde (Berkai) who first became a Mussulman allowed the Russians to found a Christian bishopric in his capital. One of his successors, half a century later, married a daughter of the Byzantine emperor, and gave his own daughter in marriage to a Russian prince. These represent the bright side of Tatar rule. It had its dark side also. So long as a great horde of nomads was encamped on the frontier the country was liable to be invaded by an overwhelming force of ruthless marauders. These invasions were fortunately not frequent, but when they occurred they caused an incalculable amount of devastation and suffering. In the intervals the people had to pay a fixed tribute. At first it was collected in a rough-and-ready fashion by a swarm of Tatar tax-gatherers, but about 1250 it was regulated by a census of the population, and, finally, the collection of it was entrusted to the native princes, so that the people were no longer brought into direct contact with the Tatar officials. By the princes with the "yoke" was taken more keenly, and it was very galling. In order to reply to accusations brought against them, or in order to confirm in their functions, they had to travel to the Golden Horde on the Volga or even to the camp of the grand khan in some distant part of Siberia, and the journey was considered so perilous that many of them, before setting out, made their last will and testament and wrote a parental admonition for the guidance of their children. Nor were these precautions by any means superfluous, for not a few princes died on the journey or were condemned to death and executed for real or imaginary offences. Even when the visit to the Horde did not end so tragically, it involved a great deal of anxiety and expense, for the Mongol dignitaries had to be conciliated very liberally, and it was commonly believed that the judges were more influenced by the amount of the bribes than by the force of the arguments. The grand khan was the lord paramount or suzerain of the Russian princes, and he had the force required for making his authority respected. Ambitious members of the Rurik dynasty, instead of seeking to acquire territory by conquest in the field, now sought to attain their ends by intrigue and bribery at the Mongol court.

Of all the princes who sought to advance their fortunes in this way the most dexterous and successful were those of Moscow. They made themselves responsible for the tribute of other principalities as well as of their own, and gradually they became lieutenants-general of their Mongol suzerain. So long as the Mongol empire remained united and strong, they were most submissive and obsequious, but as soon as it was weakened by internal dissensions and began to fall to pieces, they assumed airs of independence, intrigued with the insubordinate Tatar generals, retained for their own use the tribute collected for the grand khan, and finally put themselves at the head of the patriotic movement which aimed at throwing off completely the hated Mongol yoke. For this purpose Dimitri Donskoi formed in 1380 a coalition of Russian princes, and gained a great victory over Khan Maimai of the Golden Horde on the famous battle-field of Kulikovo, the memory of which still lives in the popular legends. For some time after the Tatars remained troublesome neighbours, capable of invading and devastating large tracts of Russian territory and of threatening even the city of Moscow, but the Horde was now broken up into independent and mutually hostile khanates, and the Moscow diplomatists could generally play off one khanate against the other, so that there was no danger of the old political domination being re-established.

Having thus freed themselves from Tatar control, the Moscow princes continued to carry out energetically their traditional policy of extending and consolidating their dominions at the expense of their less powerful relations. Already Dimitri of the Don was called the grand-prince of all Russia, but the assumption of such an ambitious title was hardly justified by facts, because there were still in his time principalities with grand-princes who claimed to be independent. The complete suppression of these small moribund states and the creation of the autocratic tsardom of Muscovy were the work of Ivan III, who deposed the Great, his son Basil and his grandson Ivan IV., commonly known as Ivan the Terrible, whose united reigns covered a period of 122 years (1462–1584).

III. The Tsardom of Muscovy.—What may be called the home policy of these three remarkable rulers consisted in absorbing the few principalities which still remained independent, and in creating for themselves an uncontrollable monarchical authority. In the pursuit of both of these objects they were completely successful. When Ivan III. came to the throne the remaining independent principalities were Great Novgorod, Pskov, Tver, Ryazan and Novgorod-Seversk. He first directed his attention to Novgorod, and by gradually undermining and then destroying the ancient republican liberties he reduced the haughty city, which had long styled itself Lord Novgorod the Great, to the rank of a provincial town. Then he annexed its colonies and thereby extended his dominions to the Polar Ocean and the Ural Mountains. At the same time he took possession of Tver, on the ground that the prince had allied himself with Lithuania. His successor Basil followed in his footsteps, and dealt with the municipal republic of Pskov was Ivan had dealt with Novgorod. Finding the inhabitants too much attached to
dissatisfaction among men of Slavonic temperament, whose
grandfathers had been independent princes, boyars or free
lances, and the malcontents could not adopt the old practice
of emigrating to some other principality. There was no longer
within the Russian land any independent principality in which
an asylum could be found, and emigration to a principality
beyond the frontier, such as Lithuania, was regarded as treason,
for which the property of the fugitive would be confiscated
and his family might be punished. In these circumstances
the only outlet for discontent was sedition, and the malcontents
awaited impatiently a favourable opportunity for an attempt
to curb or overthrow the autocratic power. That opportunity
came when Basil died in 1533, leaving as successor a child only
three years old, and the chances seemed all on the side of
the nobles; but the result belied the current expectations, for
the child came to be known in history as Ivan the Terrible, and
died half a century later in the full enjoyment of unlimited
autocratic power. The fierce struggle between autocratic tyranny
and oligarchic disorder, which went on in intermittent fashion
during the whole of his reign, cannot be here described in detail,
but the chief incidents may be mentioned.

During Ivan's minority the country was governed, or rather
misgoverned, first by his mother, and then by rival factions
led by great nobles such as the princes Shuiski and
Beliński. Only once during this period did the young
tsar come forward and assert his authority. Having
convoked his boyars he reproached them collectively with
robbing the treasury and committing acts of injustice,
and he caused one of them, a Prince Shuiski who happened
to be in power at the moment, to be seized by his hunts-
men and torn in pieces by a pack of hounds, as a warning
to others. Thus apparently he asserted his authority, but
in reality, being only thirteen years old, he was a mere
puppet in the hands of one of the opposition factions, who
wished to oust their rivals, and for the next four years the
misgovernment of the nobles went on as before. It was not till
he was about seventeen that he took an active part in the ad-
ministration, and one of his first acts foreshadowed his future
policy: he insisted on the metropolitan crowning him, not as
grand-prince of Muscovy, but as tsar of all Russia (1547).

From the earliest times the term tsar—a contraction of the word
Caesar—had been applied to the kings in Biblical history
and the Byzantine emperors, and Ivan III had already been
described in the Church service as "the ruler and autocrat of all
Russia, the new Tsar Constantine in the new city of Constantine
Moscow," but on no previous occasion had a grand-prince been
crowned under that title. A few months later occurred in
Muscovy a great fire, which destroyed nearly the whole of
the city, and a serious popular tumult, in which the tsar's uncle
was murdered by the populace. Ivan regarded these events as
a punishment from Heaven; for the neglect of his duties, and he
began to attend to public affairs under the influence of an
enlightened priest called Sylvester and an official of humble origin
known as Deen Adelung. This new line of counsellors
he held in check the lawless, turbulent nobles, and ruled justly,
to the satisfaction of the people, for fourteen years. Then
suddenly, for reasons which cannot easily be explained, he
inaugurated a reign of terror which lasted for twenty-four years
and earned for him the epithet of "the Terrible." Though there
had been no open insurrection, he caused many boyars and humber
persons to be executed, and when some of the great nobles,
fearing a similar fate, fled across the frontier and tendered their
allegiance to the prince of Lithuania, his suspicion and indigna-
tion increased and he determined to adopt still more drastic
measures. For this purpose he organized, outside the regular
administration, a large corps of civil officials and armed
retainers, whose duty it was to obey him implicitly in all things;
and with this force, which rose rapidly from 1000 to 6000 men,
he acted like a savage invader in a conquered country. Ac-
panied by these so-called Oprichniki, who have been
compared to the Turkish Janissaries of the worst period, he
ruthlessly devastated large districts—with no other object

1 See Friedrich Adelung, Siegmund Freiherr von Herberstein, mit
besonderer Rücksicht auf seine Reisen in Russland geschrieben. (St.
Petersburg, 1818); autobiography of Herberstein in Fontes rerum
Austricarum, part i. vol. i. pp. 67-396.
apparently than that of terrorizing the population and rewarding his myrmidons—and during a residence of six weeks in Novgorod, lest the old turbulent spirit of the municipal republic should revive, he massacred, it is said, no less than 60,000 of the inhabitants, including many women and children. It is quite possible, as some apologists suggest, that the number of his victims may have been exaggerated, but that they are to be counted by thousands there can be no doubt. In the monastery of St. Cyril has been preserved a list of those for whom he requested the prayers of the Church, the total being 3470. The only reference to Novgorod in this curious document is: “Remember, O Lord, the souls of thy Novgorodian servants to the number of 1505 persons.” According to the Novgorodian annalists as many as 1700 persons were sometimes put to death in a single day. Perhaps the discrepancy is to be explained by supposing that the pius tsar did not consider all his victims as servants of the Lord, whose souls deserved the prayers of the faithful.

While thus uniting under their vigorous autocratic rule the small rival principalities, the Moscow princes had kept to a watchful eye on their eastern neighbours. The Golden Horde weakened by internal dissensions, had now fallen into several khanates, the chief of which were Kazan, Astrakhan and the Crimea. As these independent Tatar states were always jealous of each other, and their jealousy often broke out in open hostility, it was easy to prevent any combined action on their part; and as in each khanate there were always several pretenders and contending factions, Muscovite diplomacy had little difficulty in weakening them individually and preparing for their annexation. In the case of Kazan and Astrakhan the annexation was effected without any great effort in 1552–54, and two years later the Bashkirs, who had likewise formed part of the great Mongol empire, consented to pay tribute. On the other hand, the khans of the Crimea were amenable, partly from their geographical position and partly from having placed themselves under the protection of the sultans of Turkey, to resist annexation for more than two centuries and to give the Muscovites a great deal of trouble, not only by frequent raids and occasional invasions, but also by allying themselves with the Western khanates of the tsars. As late as 1571 Moscow was pillaged by a Tatar horde; but there was no longer any question of permanent political subjection to the Asiatics, and the Russian frontier was being gradually pushed forward at the expense of the nomads of the steppe by the constant advance of the agricultural population in quest of virgin soil. These latter, like the colonists in the American Far West, had to be constantly on the alert against the attacks of their troublesome neighbours, and they accordingly organized themselves in semi-military fashion. Those of them who lived on the outskirts of the pacified territory adopted a mode of life similar to that of their hereditary opponents, and constituted a peculiar class known as Cossacks, living more by flocks and herds and by marauding expeditions than by agriculture. In the basins of the southern rivers they formed semi-independent military communities. Those of the Volga and the Don professed allegiance to the tsar of Muscovy, while those of the Dnieper recognized at first as their suzerain the king of Poland. In neither case did the allegiance involve strict obedience to orders from the superiors, and their loyalty was always in danger of being troubled by their love of independence and equality and their desire for loot. More than once they RAIDED and pillaged in wholesale fashion the territory they were supposed to protect. On the whole, however, at that period as in more recent times, they contributed largely to the process of territorial expansion. (See also Poland: History.)

Before the Eastern menace had been entirely removed the ambitious Moscow princes had begun to look with envious eyes beyond their western frontier. Here lay the principality of Lithuania and beyond it the kingdom of Poland, two loosely conglomterated states which had been created by the Plast and Gedimin dynasties in pretty much the same way as the tsardom of Muscovy had been created by the descendants of Rurik. When the two became united under one ruler towards the end of the 14th century they formed a broad strip of territory stretching from the Baltic to the Black Sea and separating Russia from central Europe. For Russian ambition the barrier was formidable, but it did not entirely preclude possibilities of expansion in a more or less remote future. When examined closely it was found to contain many internal flaws. In no sense could it be considered a homogeneous political unit, for in Lithuania the majority of the population were Russian in nationality, language and religion, whereas in Poland the great majority of the inhabitants were Polish and Roman Catholic. Gradually, it is true, the Lithuanian nobles, who possessed all the land and held the peasantry in a state of serfage, adopted Polish nationality and culture, but this change did not secure homogeneity, because the masses clung obstinately to their old nationality and religion, and all the efforts of the Church of Rome to bring them under papal authority proved fruitless. A further source of weakness was the political organization. Nominally it was an hereditary monarchy, but the warlike, turbulent nobles systematically encroached on the sovereign power and were considered to be the real masters of the land, with the result that the kingdom of Poland, including the principality of Lithuania, was at last, politically speaking, the most anarchical country in Europe.

As the Muscovite and the Lithuano-Polish princes were equally ambitious and equally anxious to widen their borders, they naturally came into conflict. At first the Muscovite was decidedly the aggressor. On the death of Casimir, king of Poland and grand-prince of Lithuania, in 1492, the kingdom and the principality ceased to be united and Ivan III. considered he had a good opportunity for attacking the latter. After a short campaign a peace was concluded and Ivan's daughter was given in marriage to the Lithuanian grand-prince, but the matrimonial alliance did not improve the relations between the two countries. On the contrary it served as a pretext for Ivan to interfere in Lithuanian affairs. He not only insisted that his daughter's religion should be duly respected, but he constituted himself the protector of the Orthodox population and this led to a new war in 1499 which went on till 1503, when it was concluded by the cession to Russia of Chernigov, Starodub and 17 other towns. His successor, Basil, tried to get himself elected grand-prince of Lithuania when the throne became vacant by the death of his brother-in-law in 1506, but the choice fell on the late prince's brother Sigismund, who was likewise elected king of Poland. The two countries were thus once more united and better able to resist aggression, but some of the great nobles were discontented and Basil hoped with their assistance to attain his ends. He began war therefore in 1514 and at once captured Smolensk, but in the following year he was defeated, and the war dragged on during more than seven years, with varying successes and without any important result. In the negotiations for peace the inordinate pretensions of the Muscovite prince were put forward boldly: he not only refused to restore Smolensk, but claimed Kiev and a number of other towns on the ground that in the old time of the independent principalities they had belonged to descendants of Rurik.

The policy of expansion westwards, inaugurated by Ivan III., was modified and enlarged by Ivan the Terrible. The former had aimed simply at making annexations in Lithuania; the latter aspired to obtaining a firm footing on the Baltic coast and establishing direct relations, diplomatic and commercial, with the Western Powers. In this respect he was a precursor of Peter the Great, but he greatly underestimated the difficulties of the task. To reach the Baltic he had to overcome the resistance, not only of the Lithuanians and the Poles, but also of the Teutonic and Livonian military orders, the Swedes and the Danes, who all had possessions in the intervening territory and who all objected to the barbarous Muscovites, already sufficiently formidable, strengthening themselves by direct foreign trade with western Europe and especially by the importation of arms and cunning
foreign artificers. Like the European settlers on the coast of Africa in more recent times, they wished the barbarians of the interior to be restricted to the use of their primitive weapons. One of the Polish kings, for example, threatened to use the English sailors who should attempt to carry on the illicit trade in arms, on the ground that "the Muscovites, who is not only our opponent of to-day but the eternal enemy of all free nations, should not be allowed to supply himself with cannon, bullets and munitions or with artisans who manufacture arms hitherto unknown to those barbarians." This was precisely the reason why Ivan IV. was so anxious to force his way to the coast. His grandfather had obtained from Venice an "artist" who undertook "to build churches and palaces, to cast big bells and cannons, to fire off the said cannons and to make every sort of castings very cunningly"; and with the aid of that clever Venetian he had become the proud possessor of a "cannon-house," subsequently dignified with the name of "arsenal." In imitation of the grandfather the grandson gave a commission to a Saxon, in whom he had confidence, to collect artists and artisans in Germany and bring them to Moscow, but he was prevented from carrying out his scheme by the Livonian Order (1547). A few years later (1553) he found unexpectedly a different route for communication with the West. A ship of an English squadron which was trying to reach China by the North-East passage, entered the northern Dvina, and her captain, Richard Chancellor, journeyed to Moscow in quest of opportunities for trade. He met with such a favourable reception from the tsar that on his return to England a special envoy was sent to Moscow by Queen Mary, and he succeeded in obtaining for his countrypeople the privilege of trading freely in Russian towns. In return the Russians were allowed to trade freely in England. This afforded good satisfaction to Ivan, but it did not entirely satisfy his requirements, because the new route by the White Sea and the North Cape was long and uncertain, and part of the ship communications were stopped by the ice. He continued, therefore, his efforts to reach the Baltic coast, and he soon came into collision with the Swedes. After a dilatory war of three years he concluded a peace on the ground of free commercial relations, and then he attacked the Livonian Order, on the pretext that the Livonian town of Dorpat had not paid tribute according to ancient treaties. Finding himself unable to resist the Muscovites, the grand master of the Order put himself under Polish protection, and this led to a seven years' war (1563-70) with Poland, during which the Swedes and Danes intervened on their own account. Ivan did not display much military talent, but he showed a remarkable amount of tenacity. No sooner had he made peace with the Poles and failed to get himself elected as their king, than he began a war with the Swedes which dragged on for more than a decade (1572-1583), and before it was ended he was again at war with Poland (1579-81). Though severely tried by disappointments and defeats he never lost hope, and when he died in 1584 he was preparing to renew the struggle and endeavouring to form for that purpose an alliance with England; his great idea, however, was not to be realized till more than a century later, and meanwhile the tsardom of Muscovy had to pass through a severe internal crisis in which its existence was seriously endangered.

Ivan the Terrible had succeeded in stamping out ruthlessly all open resistance to his will, and had created an autocratic government of the Oriental type; but the elements of disorder were still lying beneath the surface, and as soon as the cunning, energetic despot died they reappeared. His son and successor, Theodore (Feodor), was a weak man of saintly character, very ill fitted to consolidate his father's work and maintain order among the ambitious, turbulent nobles; but he had the good fortune to have a brother-in-law, with the pretensions to sanctity, called Boris Godunov, who was able, with the tsar's moral support, to keep his fellow-boyars in order. This he did during fourteen years, and his administration was signalized by two important innovations—the attaching of the peasants to the land (adscriptio glebae) and the creation of the patriarchate—both of which deserve a passing notice.

Boris has often been called the creator of servage in Russia, but in reality he merely accelerated a process which was the natural result of economic conditions. In a primitive, thinly populated, agricultural country, in which the demand for agricultural labour greatly exceeds the supply, the value of land is in proportion to the number of permanent labourers settled on it, and the landed proprietors naturally try to attract to their estates as many peasants as possible; and in this competition the large proprietors have evidently an advantage over their humbler and weaker rivals. Such had been for a considerable time the condition of Russia, and the small proprietors were now becoming so impoverished that they could no longer fulfil their duties to the state. The remedy they proposed was that the labourers should be prohibited from migrating from one estate to another, and an order to that effect was issued, with the result that the peasants, being no longer able to change their domicile and seek new employers, fell practically under the unlimited power of the proprietors on whose land they resided. This change was, of course, popular among the lower and middle ranks of the landlord class, but was very displeasing to the great nobles.

The second of the two innovations above mentioned was popular among all classes. Hitherto the highest authority in the Russian Church was the metropolitan, who was nominally under the jurisdiction of the patriarch of Constantinople, and as soon as Constantinople fell into the hands of the infidel, and the tsars of Muscovy claimed to be the successors of the Byzantine emperors, it seemed right and proper that the Russian Church should become eireneophylous and be governed by an independent Russian patriarch. The change was very dexterously effected by Godunov, with the formal assent of the Eastern Orthodox Church as a whole, and one of his passions a close adherence to the Orthodox faith.

Having thus gained the support of a large majority of the landed proprietors and the ecclesiastics, Boris Godunov increased his influence to such an extent that on the death of Tsar Feodor without male issue in 1598 he was elected his successor by a Great National Assembly. His short reign was not so successful as his administration under the weak Feodor. The oligarchical party considered it a disgrace to obey a simple boyar; conspiracies were frequent, the rural districts were desolated by famine and plague, great bands of armed brigands roamed about the country committing all manner of atrocities, the Cossacks on the frontier were restless, and the government showed itself incapable of maintaining order. Under the influence of the great nobles who had unsuccessfully opposed the election of Godunov, the general discontent took the form of hostility to him as a usurper, and rumours were heard that the late tsar's younger brother Dimitri (Demetrius, supposed to be dead, was still alive and in hiding. In 1603 a man calling himself Dimitri, and professing to be the rightful heir to the throne, appeared in Poland, and a few months later he crossed the frontier with a large force of Poles, Russian exiles, German mercenaries and Cossacks from the Dnieper and the Don. In reality the younger son of Ivan the Terrible had been strangled before his brother's death—by orders, it was said, of Godunov—and the mysterious individual who was impersonating him was an impostor; but he was regarded as the rightful heir by a large section of the population, and immediately after Boris's death in 1605 he made his triumphal entry into Moscow. Thus began a period of Russian history commonly called "the Troubles Times," which lasted until 1613. (See DEMETRIUS, PSEUDO.)

The reign of Dimitri was short and uneventful. Before a more hardy and vigorous pretender to the throne had passed a conspiracy was formed against him by an ambitious noble called Basil (Vassili) Shuiski, and he was assassinated in the Kremlin. The chief conspirator, Shuiski, seized the power and was elected tsar by an Assembly composed of his faction, but neither
the ambitious boyars, nor the pillaging Cossacks, nor the German mercenaries were satisfied with the change, and soon a new impostor, likewise calling himself Dimitry, son of Tsar Ivan, came forward as the rightful heir. Like his predecessor, he enjoyed the protection and support of the Polish king, Sigismond III., and was strong enough to compel Shuisky to abdicate; but as soon as the throne was vacant Sigismond put forward as a candidate his own son, Vladislaus. To this latter the people of Moscow swore allegiance on condition of his maintaining Orthodoxy and granting certain rights, and on this understanding the Polish troops were allowed to occupy the city and the Kremlin. Then Sigismond unveiled his real plan, which was to obtain the throne not for his son but for himself. This scheme did not please any of the contending factions and it roused the anti-Catholic fanaticism of the masses. At the same time it was disposing the Swedes, who had become rivals of the Poles on the Baltic coast, and they started a false Dimitry of their own in Novgorod.

Russia was thus in a very critical condition. The throne was vacant, the great nobles quarrelling among themselves, the Catholic Poles in the Kremlin of Moscow, the Protestant Swedes in Novgorod, and enormous bands of brigands everywhere. The severity of the crisis produced a remedy, in the form of a patriotic rising of the masses under the leadership of a butcher called Minin and a Prince Pozharski. In a short time the invaders were expelled, and a Grand National Assembly elected as tsar Michael Romanov, the young son of the metropolitan Philaret, who was connected by marriage with the late dynasty.

During the reign of Michael (1613–45) the new dynasty came to be accepted by all classes, and the country recovered to some extent from the disorders and exhaustion from which it had suffered so severely; but it was not strong enough to pursue at once an aggressive foreign policy, and the tsar prudently determined to make peace with Sweden and conclude an armistice of fourteen years with Poland. At the conclusion of the armistice in 1632, during a short interregnum in Poland, he attempted to avenge past injuries and recover lost territory; but the campaign was not successful, and in 1634 he signed a definitive treaty by no means favourable to Russia. That lesson was laid to heart, and he subsequently maintained a purely defensive attitude. As a precaution against Tatar invasions he founded fortified towns on his southern frontiers—Tambov, Kozlov, Penza and Simbirsk; but when the Don Cossacks offered him Azov, which they had captured from the Turks, and a National Assembly, convoked for the purpose of considering the question, were in favour of accepting it as a means of increasing Russian influence on the Black Sea, he decided that the town should be restored to the sultan, much to the disappointment of its captors.

In the reign of Michael's successor, Alexius (1645–76), the country recovered its strength so rapidly that the tsar was tempted to revive the energetic aggressive policy and push forward claims. Lithuania, Lithuania and Little Russia, but he was obliged to moderate his pretensions. Livonia continued to be under Swedish rule, and Lithuania remained united with Poland. Some advantages, however, were obtained. Smolensk and Chernigov were definitely incorporated in the tsardom of Muscovy, and great progress was made towards the absorption of Little Russia.

Roughly speaking, Little Russia, otherwise called the Ukraine, may be described as the basin of the Dnieper southward of the 51st parallel of latitude. In the 16th century it was a thinly populated region inhabited chiefly by Cossacks, speaking the so-called Little Russian dialect, and until 1569 it formed nominally part of Lithuania, but was practically independent. In that year, when Lithuania and Poland were permanently united, it fell under Polish rule, and the Polish government considered it necessary to tame the wild inhabitants and bring them under regular administration. For this decision there were good reasons, for those turbulent sons of the steppe paid no taxes and were much given to brigandage, and their raiding peregrinations occasionally created international difficulties with the khan of the Crimea and the sultan of Turkey. It was proposed, therefore, in 1576, that 6000 families should be registered as a militia under a Polish Hetman for the protection of the country against Tatar raids, and that the remainder of the inhabitants should be assimilated to the ordinary peasants of Poland. This arrangement was very distasteful to all classes. The registered Cossacks objected to being placed under a Hetman not freely chosen by themselves, and those who were not included in the militia objected still more strongly to the prospect of being reduced to the miserable condition of Polish serfs. To escape this danger many of them moved down the river and settled on the waste lands beyond the rapids. Here, about 1590, was founded an independent military colony called the Selsch, the members of which, recognizing no authority but that of their own elected officers, lived by fishing, hunting and making raids on the Tatars, and were always ready to assist their less fortunate countrymen in resisting Polish aggression. For half a century this struggle between the two races went on with varying success, but on the whole the Polish government proved stronger than its insubordinate subjects, and about 1638 it seemed to have attained its object. Polish proprietors settled in large numbers on the Cossack territory, and great efforts were made, with the assistance of the Jesuits, to bring the Orthodox population under papal authority. But for both proprietors and Jesuits a surprise was in store. Threatened seriously in their liberty and their faith, the people rose with greater enthusiasm than before, and a general insurrection, in which the peasants joined, spread over the whole country under the leadership of Bogdan Chmielnicki or Khmelntski (q.v.), whose name is still remembered in the Ukraine. As in all previous insurrections the Poles proved stronger in the field, and Khmelntski in desperation sought foreign assistance, first in Constantinople and then in Moscow. For some time Tsar Alexius hesitated, because he knew that intervention could entail a war with Poland, but after consulting a National Assembly on the subject, he decided to take Little Russia under his protection and in January 1654 a great Cossack assembly ratified the arrangement, on the understanding that a large part of the old local autonomy should be preserved. In the expected war with Poland, which followed quickly, the Russians were so successful that the arrangement was upheld; but it was soon found that the Cossacks, though they professed unbounded devotion to the Orthodox tsar, disliked Muscovite, quite as much as Polish, interference in their internal affairs, and some of their leaders were in favour of substituting federation with Poland for annexation by Russia. In these circumstances the tsar was induced to accept a compromise, and signed in 1667 the treaty of Andrusov, by which the territory in dispute was partitioned and the middle course of the Dnieper became the frontier between Russia and Poland.

In the reign of Alexius a conflict took place between the tsar and the patriarch, which is often described as a conflict between Church and State, a conflict that determined the relations between the temporal and the spiritual powers in Russian state-organization. Until the beginning of the 17th century the Byzantine tradition that in all matters outside the sphere of dogma the ecclesiastical is subordinate to the civil power had been observed in Russia; but the traditional conceptions had been to some extent undermined during the reign of Michael, when the metropolitan Philaret, who was the tsar's father (vide supra), became patriarch and was associated with him in the government on a footing of equality. Like the tsar, he had the official title of "Great Lord" (velikiy gosudar), and he had his palace, his court-dignitaries, his retinue, his boyars and his officials all organized on the model of those of the sovereign. Without his assent and blessing no important decisions were taken. All state documents emanating from the highest authority bore his signature, and he was regarded, both in the official world and by the
public generally, as the tsar's equal in rank and dignity. His immediate successors, being men of humble origin and submissive character, made no pretensions to such an exalted position, but when the haughty, ambitious and energetic Nikon, who enjoyed in large measure the affection and favour of the devout Tsar Alexius, became patriarch, he took Philaret as his model, and propounded, like the popes in western Europe, the doctrine that the spiritual is higher than the temporal power, the former corresponding to the sun and the latter to the moon in the firmament. In accordance with this view he declared that the patriarch was the image of Christ, the head of the Church, and was therefore subject to no earthly authority, and he complained of the tsar's interference in ecclesiastical affairs. His pretensions and his haughty dictatorial manner at last exhausted the tsar's patience, and he was formally deposed and exiled to a monastery. As no voice was raised in his defence and the decision of the ecclesiastical council which condemned him was universally accepted without protest, we must conclude that the conflict was not really between Church and State but simply between the haughty, ambitious Patriarch Nikon and the devout, long-suffering Tsar Alexius. The incident afforded a new proof, where no proof was required, that the autocratic power in Russia was supreme. In order to prevent such incidents in future, Peter the Great abolished the patriarchate altogether, and entrusted the administration of the Church to a synod entirely dependent on the government.

Much more important in its consequences was Nikon's activity as an ecclesiastical reformer. During the Russian Dark Ages certain clerical errors had crept into the liturgical books and certain peculiarities had been adopted in ritual. These had been detected and pointed out by learned ecclesiastics of Kiev, where some of the ancient learning of Byzantium had been preserved, and Nikon determined to make the necessary corrections. He determined also to introduce into the Church many desirable reforms. His project was approved by an ecclesiastical council and was supported by the tsar, but it met with violent opposition from a large section of the clergy, and it alarmed the ignorant masses, who regarded any alterations in the ritual, however insignificant they might be, as heretical and very dangerous to salvation. When put into execution the project produced in the Russian Church a great schism and numerous fantastic sects. The cruel persecutions instituted by the authorities with a view to securing conformity increased the number and fanaticism of the schismatics and heretics, and created among them a widespread belief that the reign of Antichrist, foretold in the Apocalypse, was at hand. In support of this idea, independently of the ecclesiastical innovations, many significant facts could be adduced. Numerous foreigners had been allowed to settle in Moscow and to build for themselves a heretical church, and their strange unholy customs had been adopted by not a few courtiers and great dignitaries. Matveev, the most influential of the boyars, had married a foreigner who conversed freely with her husband's male friends, cooked her food under a liturgical decretum, and his house, in which the tsar was a frequent visitor, was richly furnished and decorated in foreign fashion. Books on mundane subjects, not at all conducive to the spiritual edification of the faithful, were read by the tsar's counsellors, and a theatre had been erected, in which the tsar often witnessed very unedifying dramas and ballets. Worst of all, the Orthodox tsar occasionally abandoned the decorous flowing robes of his venerated ancestors, and appeared publicly in the unseemly costume of heretical foreigners, whilst his consort, when carried through the streets in a litter, did not conceal her face from the public gaze. Such innovations troubled deeply the pious souls of the conservative Muscovites, and confirmed them in their repugnance to accept the ecclesiastical reforms. Though this original fanaticism gradually cooled and the rigorists had to make many concessions to the exigencies of practical life, a large section of the Russian people remained outside the official fold, so that at the present day, if we may credit the most competent authorities, the schismatics and heretics number more than twelve millions.

While the Muscovites of the upper classes were thus beginning to abandon their old oriental habits, their government was preparing to make a political evolution of a similar kind. Notwithstanding the efforts of the Poles and the Military Orders to exclude Russia from the shores of the Baltic and keep her in a state of isolation, she was coming slowly into closer relations with central and western Europe. The emperor, the governments of England, Holland, France and Sweden, and even the Grand Turk made advances to the tsar. Some of them wished to gain him as an ally against their rivals, whilst others hoped to obtain from him commercial privileges and permission to trade directly with Persia. The political and the commercial proposals were alike received with coldness, because the native diplomatists had aims which could not be reconciled completely with the policy of any other country, and the native merchants were afraid of foreign competition. The negotiations gave, therefore, little tangible result, but they helped to prepare the way for the new order of things which was soon to be introduced by Alexius's son, Peter the Great.

Before reaching the new order of things, the country had to pass through an internal crisis similar to that which followed the death of Ivan the Terrible, but not nearly so severe. Alexius had been twice married and had left several children by each of his wives, and, as generally happened in such cases, a struggle for power ensued between the two rival families. The late tsar's eldest son, Theodore, was weak in health and died without male issue after an eventful reign of six years (1676-82). As the second son, Ivan, next in the order of succession, was almost an imbecile, the third son, Peter, born of the second marriage, was proclaimed tsar, and his maternal relations became the dominant faction, but their triumph was of very short duration. An ambitious, energetic sister of Ivan, well known in Russian history as Sophia Alekseyevna, instigated the stryelsi (strelits), as the troops of the unrefomed standing army were called, to upset the arrangement. After making a tumult in the Kremlin, and assassinating several of the men in power, they insisted that Ivan should be proclaimed tsar conjointly with Peter, and that Sophia should act as regent during the minority of the two young sovereigns. She accepted unhappily the difficult and dangerous post, and ruled autocratically for seven years (1682-89), but this did not satisfy her ambition. Having discovered that Peter, who had reached the age of seventeen, was thinking of taking the administration into his own hands, she conspired against him with the commander of the stryelsi and some of his maternal relations; but she was circumvented by the rival faction and interned in a convent, and Peter's mother was put in her place. The importance of these incidents, which are very characteristic of political life in the tsardom of Muscovy, will appear in the sequel.

If Peter really thought of taking the administration into his own hands, he very soon abandoned the idea and returned to the irregular suburban life he had led during his half-sister's regency. Social life in the Russian élite was limited to the mechanical arts of the West, drilling troops, building and sailing boats, forming projects for the creation of a great navy, indulging publicly in Bacchanalian revels and boisterous amusements not at all to the taste of his pious countrymen, and appearing in Moscow as Orthodox tsar only on great ceremonial occasions. Already the desire to make his country a great naval power was becoming his ruling passion, and when he found by experience that the White Sea, Russia's sole maritime outlet, had great practical inconveniences as a naval base, he revived the project of getting a firm footing on the shores of the Black Sea or the Baltic. At first he gave the preference to the former, and with the aid of a flotilla of small craft, constructed on a tributary of the Don, he succeeded in capturing Azov from the Turks. Greatly elated by this success, he recommended to the council of boyars the construction of a powerful fleet for carrying on war with the infidel, and he himself went abroad to learn more about shipbuilding and useful foreign inventions, and to prepare...
diplomatically the projected crusade. His foreign tour, during which he visited Germany, Holland, England, France and Austria, lasted nearly a year and a half, and was suddenly interrupted, when on his way from Vienna to Venice to study the construction of war-galleys, by the alarming news that the turbulent Strzyłski of Moscow had mutinied anew with the intention of placing Sophia on the throne. On arriving in Moscow he found that the mutiny had been suppressed and the ringleaders punished, but he considered it necessary to reopen the investigation and act with exemplary severity. Of the surviving mutineers over twelve hundred were executed, some of them by his own hand, and the entire corps was disbanded.

From this moment may be dated the personal reign of Peter, for he now began to direct personally all branches of the administration, and governed with indefatigable vigour for twenty-seven years, during which he greatly increased the area and profoundly modified the internal condition of his country. At first he concentrated his attention on foreign affairs. During his foreign tour he had discovered that the idea of a grand crusade against the infidel was impossible, for France was, according to her traditional policy, the ally of the sultan, Austria wished to avoid trouble on her eastern frontier in order to devote her energies to the question of the Spanish succession, and all the other countries which he wished to draw into the coalition had good reasons of their own for desiring the maintenance of peace in eastern Europe. For his Baltic schemes, on the contrary, he had found the ground well prepared. During a halt of a few days in Poland on his way back from Vienna, King Augustus had explained to him a project for partitioning the three Baltic provinces of Sweden, by which Poland should recover Livonia and annex Esthonia, Russia should obtain Ingria and Karelia, and Denmark should take possession of Holstein. As Sweden was known to be exhausted by the long wars of Gustavus Adolphus and his successors, and weakened by internal dissensions, the dismemberment seemed an easy matter, and Peter embarked on the scheme with a light heart; but his illusions were quickly dispelled by the eccentric young Swedish king, Charles XII., who arrived suddenly in Esthonia and completely routed the Russian army before Narva. Thus began the so-called Northern War, which lasted intermittently for more than twenty years, and was terminated by the treaty of Nystad (Sept. 10, 1721). By that treaty Peter acquired not only Ingria and Karelia, as originally contemplated, but also Livonia, Esthonia and part of Finland. The problem of obtaining a firm footing on the Baltic coast, on which Ivan the Terrible had squandered his resources to no purpose, was now solved satisfactorily.

Peter's other favourite scheme, that of acquiring the command of the Black Sea, was as far from realization as ever. In the midst of the Northern War, shortly after the great Russian victory at Poltava (1709), the sultan, at the instigation of Swedish and French agents, determined to recover Azov, and made great military preparations for that purpose. Having annihilated at Poltava the army of Charles XII., Peter was not at all indisposed to renew the struggle with Turkey, and began the campaign in the confident hope of making extensive conquests; but he had only got as far as the Pruth when he found himself surrounded by a great Turkish army, and, in order to extricate himself from his critical position, he had to sign a humiliating treaty by which Azov and other conquests were restored to the sultan. His dreams of freeing the Christians from the yoke of the infidel had to be abandoned, and the conquest of the northern shores of the Black Sea was postponed till the reign of Catherine II.

Those tedious and exhausting wars did not prevent Peter from attending to internal affairs, and he displayed as a reformer even more vigour and tenacity than as a general in the field. His first reforms were connected with the army. Several of his immediate predecessors had come to recognize that Russia, with her antiquated military organization, was unable to cope with her Western neighbours, and had begun to organize, with the help of foreigners, a military force more in accordance with modern requirements; but the progress made in that direction had been slow and unsatisfactory. Unlike his predecessors, Peter was in a hurry to realize his plans, and he set to work at once. In less than two years from the time of disbanded the Strzyłski he contrived to create an army of 40,000 men. This army, it is true, was so inefficient that it was completely routed by the Swedish king with a much inferior force, but it was improved gradually until it learned to conquer its Swedish opponents. To accomplish such a feat it was necessary, of course, to expend large sums of money; and as the country could ill bear an increase of taxation, the whole financial system had to be improved and the natural resources of the country had to be developed. At the same time the military and financial requirements dislocated the local and central administration, and consequently a series of radical administrative reforms had to be undertaken. Thus one reform led to another; but Peter was not dismayed by the magnitude of the task, and worked vigorously in all departments with a sublime disregard for the clamour of reactionary opponents and for the feelings and prejudices of his subjects in general. A prudent ruler in his position would have sought to preserve the outward forms while changing the inner substance, but Peter was not at all prudent in that sense. Very often he wantonly provoked opposition, as when he shaved off his beard and compelled his chief officials to do likewise, though he well knew that the operation was regarded by the ignorant masses and the pious of all ranks as a sinful defacing of the image of God. In his eyes the beard was a symbol of the old régime, and as such it must be removed. Reckless of consequences, he swept away the venerated ceremonial formalities which his ancestors had scrupulously observed, openly scoffed at ancient usage, habitually dressed in foreign costume, and generally chose foreign heretics as his boon companions. In adopting foreign innovations, he preferred the odd, albeit not necessarily the foreign, but he never entertained any sentimental preference for any particular nation, and was ready to borrow from the Germans, Dutch, English, Swedes or French whatever seemed best suited for his purpose. The innovations, it must be admitted, did not prove so efficient as he expected, because human nature and traditional habits cannot be changed as quickly as institutions. When the Boyar Duma became the Senate, and the Priboi or administrative departments were organized under the name of Colleges, and when every important town was endowed with a Rathaus, a Polizeimeister, gilds, aldermen, and all the municipal paraphernalia of western Europe, the vices of the old institutions survived in the new. Notwithstanding the changes in organization and terminology, the officials remained ignorant, indolent, careless, indifferent to the public welfare, high-handed and extortionate, and the local self-government which was intended to enlighten and control them proved sadly wanting in vitality and weight. So inefficient, indeed, were the reforms as a whole, and so unsuited to the national character and customs, that the Slavophiles of a later date could maintain plausibly the paradoxical thesis that in regard to internal administration Peter was anything but a national benefactor. However that may be, it must be confessed even by Slavophiles that he dragged his countrymen, more by force than by persuasion, from the paths of traditional routine and pushed them along with all his might on the broad road of progress in the modern sense of the term. Abandoning the ancient Muscovite capital, where many influential personages were fanatically hostile to his innovations and not a few of the superstitious inhabitants regarded him with horror as Anti-christ, he built at the mouth of the Neva a new capital which was to serve as "a window through which his people might look into Europe"; and laying aside the national title of tsar he proclaimed himself (1721) emperor (Imperator) of all Russia—much to the surprise and indignation of foreign diplomatic chancelleries, which resented the audacity of a semi-barbarous potentate in claiming to be

RUSSIA

THE MODERN EMPIRE

equal in rank with the head of the Holy Roman Empire. Gradually, however, the chancelleries had to withdraw their protests, for it came to be generally recognized that the semi-barbarian, who died at the early age of fifty-three, had transformed the oriental tardom of Moscovy into a state of the Western type and had made it a powerful member of the European family of nations (see Peter I).

IV. The Modern Empire.—On the death of Peter (1725) the internal tranquility and progress of the empire were again seriously threatened by the uncertainty of the order of succession, and the autocratic power which he had wielded so vigorously passed into the hands of a series of weak, indolent sovereigns who were habitually guided by personal caprice and the advice of intriguing favourites rather than by serious political considerations. During this period, which lasted from 1725 to 1762, the male line of the Romanov dynasty became extinct, and the succession passed to various members of the female line, which intermarried with German princes. In this way German influence was enormously increased, and was represented by men of considerable capacity holding the highest official positions, such as Birens, Menneck and Ostermann. The main events of the period may be briefly stated. Peter, by his first marriage, had a son, the unhappy caesarевич Alexius (q.v.), who figures more largely in imaginative literature than in history—a narrow-minded, obtuse, pious youth, who had no sympathy with his father's violent innovations, and was completely under the influence of the old Muscovite reactionary faction. Intimidated by the paternal anger and threats he took refuge in Austria, and when he had been induced by illusory promises to return to Russia he was tried for high treason by a special tribunal, and after being subjected to torture died in prison (1728). To avert the danger of a man of this type succeeding to the throne Peter made a law by which the reigning sovereign might choose his successor according to his own judgment, and two years later he caused his second wife, Catherine, the daughter of a Lithuanian peasant, to be crowned with all due solemnity, 'in recognition of the courageous services rendered by her to the Russian Empire.' This gave Catherine a certain right to the throne at her husband's death, and her claims were supported by Peter's most influential coadjutors, especially by Prince Menshikov, an ambitious man of humble origin who had been raised by his patron to the highest offices of state. On the other hand the great nobles of more conservative tendencies wished to get the young son of the caesarевич Alexius made emperor under their own control. The former faction triumphed, and Catherine reigned for about a year and a half, after which the son of the caesarевич Alexius, Peter II., occupied the throne from 1727 to 1730. At first he was under the tutelage of Menshikov, who wished him to marry his daughter, but he soon contrived, with the aid of the Dolgorukis and other old families, to get his imperious tutor arrested and exiled to Siberia. The Dolgorukis and their friends thus came into power, and on the death of Peter II. in 1730 they offered the throne to Anna, duchess of Courland, a daughter of Ivan V., elder brother of Peter the Great, on condition of her signing a formal document by which the seat of government should be transferred from St Petersburg to Moscow, and the autocratic power should be limited and controlled by a grand council composed of their own faction. Anna accepted the condition and became empress, but when she discovered that the attempt to limit her powers in favour of a small conservative oligarchy was extremely unpopular among all classes, she submitted the question to an assembly of 800 ecclesiastics and lay dignitaries, and at their request the unlimited autocratic rule was re-established. Her reign (1730-40) was a regime of methodical German despotism on the lines laid down by her uncle, Peter the Great, and as she was naturally indolent and much addicted to frivolous amusements, the administration was directed by her favourite Biren (q.v.) and other men of German origin. Having no male issue, she chose as her successor the infant son of her niece, Anna Leopoldovna, duchess of Brunswick, and at her death the child was duly proclaimed emperor, under the name of Ivan VI., but in little more than a year he was dethroned by the partisans of the Princess Elizabeth, a daughter of Peter the Great and Catherine I. As a true daughter of the great Russian reformer, Elizabeth (1741-61) relegated the German element to a subordinate position in the administration and gave her confidence to genuine Russians like Bestuzhev, Vorontsov, Razumovski (her morganatic husband) and the Shuvalovs. Her hatred of Germans showed itself likewise in her persistent struggle with Frederick the Great, which cost Russia 300,000 men and 30 millions of roubles—an enormous sum for those days—but in the choice of a successor she could not follow her natural inclinations, for among the few descendants of Michael Romanov there was no one, even in the female line, who could be called a genuine Russian. She proclaimed, therefore, as heir-apparent the son of her deceased elder sister Anna, Charles Peter Ulrich, duke of Holstein-Gottorp, a German in character, habits and religion, and tried to Russianize him by making him adopt the Eastern Orthodox faith and live in St Petersburg during the whole of her reign; but her well-meant efforts were singularly unsuccessful. Impervious to Russian influence, he remained true to his original nationality, and by his undisguised aversion to everything in his adopted country and his passionate, childish admiration of Frederick the Great, he made himself so unpopular that within a few months of his accession, in December 1761, he was dethroned and assasinated by the partisans of his ambitious and able consort, the famous Catherine II.

During the long reign of Catherine II. (1762-96) Russia made rapid progress in civilization, and came to be fully recognized as one of the Great Powers. Coming after a series of incompetent rulers, the German princess proved herself a worthy successor to Peter the Great, both in home and in foreign affairs; but she was not a mere imitator. Peter had endeavoured to import from western Europe the essentials of good government and such of the useful arts as were required for the development of the natural resources of the country; Catherine did likewise, but she did not restrict herself to purely utilitarian aims in the narrower sense of the term. She strove to impart also something of the refinement and ornamental attributes of Western civilization, and aspired to raise her adopted fatherland intellectually and artistically to the west-European level. This new departure she lost no time in proclaiming to the world. Within a few months of her accession, having heard that the publication of the famous French Encyclopédie was in danger of being stopped by the French government on account of its irreligious spirit, she proposed to Diderot that he should complete his great work in Russia under her protection. Four years later she endeavoured to embody in a legislative form the principles of enlightenment which she had imbued from the study of the French philosophers. A Grand Commission, which might be called a consultative parliament, composed of 652 members of all classes—officials, nobles, burgheys and peasants—and

1 To assist the reader in threading the genealogical maze briefly described above, the following tabular statement is inserted.—

(II.) Alexius (1645-78).
(III.) Theodore (1670-92).
(V.) Peter I. (1682-1725).
(VII.) Anna (1729-40). Cesarevich Alexius.
(VIII.) Ivan VI. (1740-47).
of various nationalities, was called together at Moscow to consider the needs of the empire and the means of satisfying them. The instructions for the guidance of the Assembly were prepared by the empress herself and were, as she frankly admitted, the result of "pillaging the philosophers of the West," especially Montesquieu and Beccaria. As many of the democratic principles frightened her more moderate and experienced advisers, she wisely refrained from immediately putting them into execution. After holding more than 200 sittings the so-called Commission was dissolved without getting beyond the realm of theory and pia desideria. Subsequently very important reforms were introduced, not by the vote of an assembly, but by the fiat of the autocratic power. The large territorial units of administration created by Peter the Great were broken up into so-called "governments" (gubernii) and further subdivided into districts (siewady), and each government was confided to the care of a governor and a vice-governor assisted by a council. A certain amount of local self-government was entrusted to the nobles and the burghers, and the judicial administration was thoroughly reorganized in the enlightened and humane spirit. The great estates of the Church, on which were settled about a million serfs, were secularized and assimilated with the state-domains. At one moment the idea of emancipating all the serfs was entertained, but the project was speedily abandoned, because it would have alienated the nobles—the only class on which Catherine could rely for support. To conciliate them she greatly extended the area of sequestration by making large grants of land and serfs to courtiers and public servants who had specially distinguished themselves. About education a great deal was spoken and written, and a certain amount of progress was effected. Whilst primary education was neglected, secondary schools were created in the principal towns and a Russian Academy was founded in St Petersburg. In the imperial court, so far as outward decorum and refinement were concerned, there was an immense improvement, and the upper section of the old Russian decorum became a noblesse with Frenché aristocratic conceptions and ideals. A taste for French literature spread rapidly, and the poets and dramatists of Paris found clever imitators in St Petersburg.

By such means Catherine made herself very popular in the upper ranks of society, but as a woman and a usurper who did little or nothing to lighten the burdens of the people she failed to gain the loyalty and devotion of the masses. In the first part of her reign popular discontent found expression in various forms, and on one occasion it produced a serious insurrection. In 1773 a Don Cossack called Pugachev, who was so uneducated that he could not even sign the manifestes written for him, declared himself to be Peter III., and announced that he was going to St Petersburg to punish his faithless wife and place his son Paul on the throne. Many believed, or affected to believe, in the pretender, and in a short time he gathered around him a large force of Cossacks, peasants, Tatars and Tchuvash, swept over the country as far as the lower Volga, executed mercilessly the landed proprietors, seized and pillaged the town of Kazan, and kept the whole country in a state of alarm for more than a year. Finally, after a crushing defeat in which 20,000 of the insurgents were killed and 6000 taken prisoners, he was betrayed by some of his followers and executed in Moscow. His name and exploits still live in the popular legend, and the insurrection is often referred to in revolutionary pamphlets as a laudable popular protest against tyrannical autocracy.

In foreign affairs Catherine devoted her attention mainly to pushing forward the Russian frontier westwards and southwards, and as France was the traditional ally of Sweden, Poland and Turkey, she adopted at first the so-called système du Nord, that is to say, a close alliance with Prussia, England and Denmark against France and Austria, who had buried their traditional enmity in the famous alliance of 1756. The first step westwards was taken in Courland, which lay between Russian territory and the Baltic coast. At the time of her accession the duchy was ruled by a son of the Polish king Augustus III., and he gave a pretext for aggression by refusing to allow Russian troops returning from the Seven Years' War to pass through his territory. For this unfriendly act he was deposed and replaced by Biren, who had previously been duke of Courland (1737-40) and had since then been an exile in Siberia and Yaroslav. Under Biren (1763-69) and his son and successor (1769-93), as nominees of Catherine, Courland was completely under Russian influence until 1795, when it was formally incorporated with the empire. The next country to feel the expansive tendencies of Russia was Poland, which had now very little power of resistance. Whilst Russia, Austria, Prussia and France were becoming powerful monarchies with centralized administration, Poland had remained a weak feudal republic with an elected king chosen under foreign influence and fettered by constitutional restrictions. All political authority was in the hands of turbulent nobles who quarrelled among themselves, who were always inclined to submit the questions at issue to the arbitration of arms, and who did not scruple to invite foreign powers to intervene on their behalf. The middle classes, which were making other countries rich and powerful, existed only in an embryonic condition. Instead of a well-organized army of the modern type there was merely an undisciplined militia composed almost exclusively of irregular cavalry; and the national defences as a whole were so weak that, in the opinion of such a competent authority as Maurice of Saxony, the country might easily be conquered by a regular army of 48,000 men. Here was a tempting field for the application of Catherine's aggressive policy, and if she had had to deal merely with the Poles she would have had an easy task. Unfortunately for the success of her schemes she had to reckon with stronger states which were anxious to check the Russian advance, and which were determined, in the event of aggression, to have a share of the plunder. Frederick the Great was at that moment impatient to extend and consolidate his kingdom by getting possession of the basin of the lower Vistula, which included eastern Prussia from the rest of his dominions, and Austria had also claims on Polish territory and would certainly not submit to be excluded by her two rivals. In these circumstances Catherine hesitated to bring matters to a crisis, but her hand was forced by Frederick, and in 1772 the first partition of Poland took place without any very strenuous resistance on the part of the victim. This national disaster opened the eyes of many Polish patriots to the necessity of changing radically the old order of things, and an attempt was made by them to remove some of the more glaring absurdities of the existing constitution: the throne was declared to be hereditary, the liberum veto by which any petty noble could annul the most important decision of the national assembly was abolished, the royal authority was greatly strengthened, and the towns were empowered to send deputies to the Diet (1791). Such salutary reforms were naturally unwelcome to the aggressive neighbours who wished to preserve the traditional anarchy in order to benefit from the disintegration of Poland as Russia had signed with the puppet-king in 1768 a treaty by which the constitution could not be modified without her consent, she had a plausible ground for protest. She waited, however, until a deputation of the malcontents, who regretted the loss of liberum veto and who were afraid that the party of reform might undertake the emancipation of the serfs, came to St Petersburg and asked for support in defence of the ancient liberties. Then an imperial manifesto reminding the Poles of the treaty of 1768 was issued and a large Russian force entered the Ukraine. This led to the second partition (1793), by which Russia obtained the eastern provinces with three millions of inhabitants. Even now the work of spoliation was not complete. When the patriots under Kosciusko made a desperate effort to recover the national independence the struggle produced a third partition (1795), by which the remainder of the kingdom was again divided between Russia, Prussia and Austria. Thus Poland disappeared for a time from the map of Europe.
Russia's advance westward raised indirectly the Eastern Question, because it threatened two of France's traditional allies, Sweden and Poland, and Choiseul considered that the best means of checkmating Catherine's aggressive schemes was to incite France's third traditional ally, Turkey, to attack her. This was not a difficult matter, because the Sublime Porte had many things to complain of in the past and had good reason to fear aggression in the near future. War was accordingly declared in 1768, but it proved disastrous for the sultan; and he had to sign in 1774 the treaty of Kuchuk-Kainarji, which gave Russia a firm hold on the Black Sea and the lower Danube (see Turkey: History). The Tatars of the Bug, of the Crimea and of the Kuban were liberated from the suzerainty of the Porte; Azov, Kinburn and all the fortified places of the Crimea were ceded to Russia; the Bosphorus and Dardanelles were opened to Russian merchant vessels; and Russian ambassadors obtained the right to intervene in favour of the inhabitants of the Danubian principalities. Ten years later the semblance of independence which was left to the khans of the Crimea was destroyed and the peninsula formally annexed to the empire.

The peace concluded at Kuchuk-Kainarji was not of long duration. Catherine had conceived an ambitious plan of solving radically the Eastern Question by partitioning Turkey as she and her allies had partitioned Poland, and she had persuaded the emperor Joseph II. to take part in the scheme. It was intended that Russia should take what remained of the northern coast of the Black Sea, Austria should annex the Turkish provinces contiguous to her territory, the Danubian principalities and Bessarabia should be formed into an independent kingdom called Dacia, the Turks should be expelled from Europe, the Byzantine empire should be resuscitated, and the grand-duke Constantine, second son of the Russian heir-apparent, should be placed on the throne of the Palaeologi. Rumours of this gigantic scheme reached Constantinople, and as Catherine's menacing attitude left little doubt as to her aggressive intentions the Porte presented an ultimatum and finally declared war (1787). Fortune again favoured the Russian arms, but as Austria was less successful and signed a separate peace at Sistova in 1791, Catherine did not obtain much material advantage from the campaign. By the peace of Jassy, signed in January 1792, she retained Ochakov and the coast between the Bug and the Dniester, and she secured certain privileges for the Danubian principalities, but the Turks remained in Constantinople, and the realization of the famous Greek project, as it was termed, had to be indefinitely postponed.

During the first years of the French Revolution Catherine's sympathy with philosophic liberalism rapidly evaporated, and she did all in her power to stimulate the hostility of the European sovereigns to the democratic movement; but she carefully abstained from joining the Coalition, and waited patiently for the moment when the complications in western Europe would give her an opportunity of solving independently the Eastern Question in accordance with Russian interests. That moment never came. In November 1796, when the country was not yet prepared to enter on a decisive struggle with Turkey, Catherine died at the age of sixty-six, and was succeeded by her son Paul, whom she had kept during her long reign in a state of semi-capitvity.

The short reign of Paul (1796-1801) resembled in many points the still shorter one of his father, Peter III. Both sovereigns were childishly wayward and capriciously autocratic; both were recklessly indifferent to the feelings, convictions and wishes of those around them; both took a passionate interest in the minutiae of military affairs; as Peter had conceived a boundless admiration for Frederick the Great, so Paul conceived a similar admiration for Napoleon, and both suddenly reversed the national policy to suit this feeling; both were singularly blind to the consequences of their foolish conduct; and both fell victims to court conspiracies which could be in some measure justified, or at least excused, on patriotic grounds.

Paul left no deep, permanent mark on Russian history. In internal affairs he wished to undo what his mother had done, but his impulsive, incoherent efforts in that direction merely dislocated the administrative mechanism without producing any tangible results. In foreign affairs he displayed the same capriciousness and want of perseverance. After proclaiming his intention of conferring on his subjects the blessings of peace, he joined in 1798 an Anglo-Austrian coalition against France; but when Austria paid more attention to her own interests than to the interests of monarchical institutions in general, and when England did not respect the independence of Malta, which he had taken under his protection, he succumbed to the artful blandishments of Napoleon and formed with him a plan for ruining the British empire by the conquest of India. Having roused, by what ought perhaps to be called his insanity, the enmity, distrust and fear of all around him, including some members of his own family, he was assassinated on the night of the 23rd to 24th of March 1801, and was succeeded by his son Alexander I.

The early part of Alexander's reign (1801–25) was a period of generous ideas and liberal reforms. Under the influence of his Swiss tutor, Frederick Cesar de Laharpe, he had imbued many of the democratic ideas of the time, and he aspired to put them in practice, with the assistance at first of three young friends, Novosiltsov, Adam Czartoryski and Stroganov, who were his intimate counsellors and were popularly known as the Triumvirate, and later of Mikhail Speranski (q.v.). Some of the more oppressive measures of the previous reign were abolished; the clergy, the nobles and the merchants were exempted from corporal punishment; the central organs of administration were modernized and the Council of the Empire was created; the idea of granting a constitution was academically discussed; great schemes for educating the people were entertained; parish schools, gymnasium, training colleges and ecclesiastical seminaries were founded; the existing universities of Moscow, Vilna and Dorpat were reorganized and new ones founded in Kazan and Kharkov; the great work of self-emanicipation was begun in the Baltic provinces. In all these schemes Alexander took a keen personal interest; but his enthusiasm was soon cooled by practical difficulties, and his attention became more and more engrossed by foreign affairs.

At that time, in respect of foreign affairs, Russia was entering on a new phase of her history. Hitherto she had confined her efforts to territorial expansion in eastern Europe and in Asia, and she had sought foreign alliances merely as temporary expedients to facilitate the attainment of that object. Now she was beginning to consider herself a powerful member of the European family of nations, and she aspired to exercise a predominant influence in all European questions. This tendency was already shown by Catherine when she created the League of Neutrals as an arm against the naval supremacy of England, and by Paul when he insisted that his peace negotiations with Bonaparte should be regarded as part of a general European pacification of which he must be consulted. Alexander insisted still more strongly on this claim, and in the convention which he concluded with the First Consul in October 1801 it was agreed that the maintenance of a just equilibrium between Austria and Prussia should be taken as an invariable principle in the plans of both parties, that the integrity of the kingdom of the Two Sicilies should be respected, that the duke of Württemberg should receive in Germany an indemnity proportionate to his losses, that the dominions of the elector of Bavaria should be preserved intact, and that the independence of the Ionian Islands should not be violated. Having obtained these important concessions the tsar imagined for a moment that in any further territorial changes he would be consulted and his advice allowed due weight, and he seems even to have indulged in the hope that the affairs of Europe might be directed by himself and his new ally. His illusion was soon dispelled, because the aims and policy of the two potentates were utterly irreconcilable. Whilst
the one strove to erect bulwarks against French aggression, the other had prepared the ground for fresh annexations. During 1803–4 the estrangement between the two rival rulers became inevitable. Napoleon had not become more aggressive and unceremonious in Italy and Germany. Before the end of 1803, Alexander had come to perceive the necessity of resisting him energetically in order to save Europe from complete subjection, and in August 1804 he recognized that an armed conflict was inevitable. It broke out in the following year, and after the battles of Austerlitz (December 1805) and Friedland (June 1807), in which the Russians were completely defeated, the two sovereigns had their famous interviews at Tilsit, at which they not only made peace but agreed to divide the world between them, with a sublime indifference to the interests of other states. The grandiose project was at once vaguely outlined in three formal documents, to the intense satisfaction of both parties, and on both sides there was much rejoicing at the conclusion of such an auspicious alliance; but the diplomatic honeymoon was not of long duration. The mutual assurances of unbounded confidence, admiration and sympathy, if there was any genuine sincerity in them, represented merely a transient state of feeling. Napoleon, who could brook no equal, was nourishing the secret hope that his confederate might be used as a docile subordinate in the realization of his own plans, and the confederate soon came to suspect that he was being duped. His suspicions were intensified by the hostile criticisms of the Tilsit arrangement among his own subjects and by the arbitrary conduct of his ally, who continued his aggressions in reckless fashion as if he were sole master of Europe. The sovereigns of Sardinia, Naples, Portugal and Spain were dethroned, the pope was driven from Rome, the Rhine Confederation was extended till France obtained a footing on the Baltic, the grand-duchy of Warsaw was reorganized and strengthened, the promised evacuation of Prussia was indefinitely postponed, an armistice between Russia and Turkey was negotiated by French diplomacy in such a way that the Russian troops should evacuate the Danubian principalities, which Alexander intended to annex to his empire, and the scheme for breaking up the Ottoman empire and ruining England by the conquest of India, which had been one of the most attractive baits in the Tilsit negotiations, but which had not been formulated in the treaty, was no longer spoken of. At the same time Napoleon threatened openly to crush Austria, and in 1809 he carried out his threat by defeating the Austrian armies at Wagram and elsewhere, and dictating the treaty of Schönbrunn (October 14).

Russia now remained the only unvanquished power on the continent, and it was evident that the final struggle with her could not be long delayed. It began in 1812 by the advance of the Grande Armée on Moscow, and it ended in 1815 at Waterloo. During those three years Alexander was the chief antagonist of Napoleon, and it was largely due to his skill and persistency that the allies held together and freed Europe permanently from the Napoleonic domination. When peace was finally concluded, he had obtained that predominant position in European politics which had been the object of his ambition since the commencement of his reign, and he now believed firmly that he had been chosen by Providence to secure the happiness of the world in general and of the European nations in particular. In the fulfillment of this supposed mission he was not very successful, because his conception of national happiness and the means of obtaining it differed widely from that of the peoples whom he wished to benefit. They had fought for freedom in order to liberate themselves not only from the yoke of Napoleon but also from the tyranny of their own governments, whereas he expected them to remain submissively under the patriarchal institutions which their native rulers imposed on them. Thus, in spite of his academic sympathy with liberal ideas, he became, together with Metternich, a champion of political stagnation, and co-operated willingly in the reactionary measures against the revolutionary movements in Germany, Italy and Spain. In the affairs of his own

**Nicholas I. 1825–55.**

Nicholas was a blunt soldier incapable of comprehending his brother's sentimental sympathy with liberalism. The Decembrists' abortive attempt at revolution and the Polish insurrection of 1831, which he crushed with great severity, confirmed him in his conviction that Russia must be ruled with a strong hand. That conviction he put into practice with extreme rigour during the thirty years of his reign (1825–55), endeavouring by every means at his disposal to prevent revolutionary ideas from germinating spontaneously among his subjects and from being imported from abroad. For this purpose he created a very severe press-censorship and an expensive system of passports, which made it more difficult for Russians to visit foreign countries. It would be unjust, however, to say that he was the determined enemy of all progress. Progress was to be made in certain directions and in a certain way. Not only was the army to be well drilled and the fleet to be carefully equipped, but railways were to be constructed, river-navigation was to be facilitated, manufacturing industry was to be developed, commerce was to be encouraged, the administration was to be improved, the laws were to be codified, and the provinces to be reorganized. All this was to be done, however, under the strict supervision and guidance of the autocratic power, with as little aid as possible from private initiative and with no control whatever of public opinion, because influential public opinion is apt to produce insubordination. When the results proved unsatisfactory, remedies were sought in increased administrative supervision, draconian legislation and severe punishment, and no attempt was made to get out of the vicious circle. In the last months of his life, under the influence of a great national disaster, the conscientious, persistent autocrat began to suspect that his system was a mistake, but he still clung to it obstinately. "My successor," he is reported to have said on his death-bed, "may do as he pleases, but I cannot change!"

This steadfast faith in autocratic methods and the exaggerated fear of revolutionary principles were shown in foreign as well as in home affairs. Like Alexander in the last period of his reign, Nicholas considered himself the supreme guardian of European order, and was ever on the watch to oppose revolution in all its forms. Hence he was generally in strained relations with France, especially in the time of Louis Philippe, who became king not by the grace of God but by the will of the people. During the revolutionary ferment of 1848–49 he urged the Prussian king to refuse the imperial crown, co-operated with the Austrian emperor in suppressing the Hungarian insurrection, and compelled the Prussians to withdraw their support from the insurgents.
in Schleswig-Holstein. Unfortunately for the peace of the world his habitual policy of maintaining the existing state of things was frequently obscured and disturbed by his desire to maintain and increase his own and his country's prestige, influence and territory. By the Persian War, which broke out in 1826, in consequence of frontier disputes, he annexed the provinces of Erivan and Nakhichevan, and during the whole of his reign the conquest of the Caucasus was systematically carried on. With regard also to the Ottoman empire his policy cannot be said to have been strictly conservative. As protector of the Orthodox Christians he espoused the cause of the rayahs in Greece, Servia and Rumania. Under a threat of war he obtained in 1826 the Convention of Akerman, by which the autonomy of Moldavia, Walachia and Servia was confirmed, free passage of the straits was secured for merchant ships and disputed territory on the Asiatic frontier was annexed, and in July 1827 he signed with England and France the treaty of London for the solution of the question by the mediation of the Powers. As the sultan rejected the mediation, his fleet was destroyed by the combined squadrons of the three Powers at Navarino; and as that was an undoubted victory, the Russian army crossed the Danube and after two hard-fought campaigns advanced to Adrianople. Here, on the 14th of September 1829, was signed a treaty by which the Porte ceded to Russia the islands at the mouth of the Danube and several districts on the Asiatic frontier, granted full liberty to Russian navigation and commerce in the Black Sea, and guaranteed the autonomous rights previously accorded to Moldavia, Walachia and Servia. By the 10th article of the treaty, moreover, Turkey acceded to the protocol of the 22nd of March 1829, by which the Powers had agreed to the erection of Greece into a tributary principality. This attempt of Russia to secure the sole prestige of liberating Greece was, however, frustrated by the action of the other Powers in putting forward the principle of the independence of the new Greek state, with a further extension of frontiers.

The result of the war was to make Russia supreme at Constantinople; and before long an opportunity of further increasing her influence was created by Mehemet Ali, the ambitious pasha of Egypt, who in November 1831 began a war with his sovereign, and by a series of conflicts over the Turkish forces in Asia Minor and threatened Constantinople. Sultan Madjmud II. after appealing in vain to Great Britain for active assistance turned in despair to Russia. Nicholas immediately sent his Black Sea fleet into the Bosphorus, landed on the Asiatic shore a force of 10,000 men, and advanced another large force towards the Turkish frontier in Bessarabia. Under pressure from England and France the Egyptians retreated and the Russian forces were withdrawn, but the tsar had meanwhile (July 8, 1833) concluded with the sultan the treaty of Unkia-Skelessi, which constituted ostensibly a defensive and offensive alliance between the two Powers and established virtually a Russian protectorate over Turkey. In a secret article of the treaty the sultan undertook in the event of a casus foederis arising, and in consideration of being relieved of his obligations under the articles of the public treaty, to close the Dardanelles to the warships of all nations "au besoin," which meant in effect that in the event of Russia being threatened with an attack from the Mediterranean he would open the Dardanelles against the invader. England and France protested energetically and the treaty remained a dead letter, but the question came up again in 1840, after Mahmud's renewed attempt to crush Mehemet Ali had ended in the utter defeat of the Turks by Ibrahim at Nezib (June 24, 1839). This time Mehemet Ali was supported by the French government, which aimed at establishing predominant influence in Egypt, but he was successfully opposed by a coalition of Great Britain, Russia, Austria and Prussia, which checkmated the aggressive designs of France by the convention of London (July 15, 1840) (see MEHMEHET ALI AND TURKEY). In this way the development of Russian policy with regard to Turkey was checked for some years, but the project of confirming and extending the Russian protectorate over the Orthodox Christians was revived in 1852, when Napoleon III. obtained for the Roman Catholics certain privileges with regard to the Holy Places in Palestine. At the same time Austria intervened in Montenegrin affairs and induced the sultan to withdraw his troops from the principality. In these two incidents the tsar perceived a diminution of Russian prestige and influence in Turkey, and Prince Menshikov was sent on a special mission to Constantinople to obtain reparation in the form of a treaty which should guarantee the rights of the Orthodox Church with regard to the Holy Places and confirm the protectorate of Russia over the Orthodox rayahs, established by the treaties of Kainari, Bucharest and Adrianople. The resistance of the sultan, supported by Great Britain and France, led to the Crimean War, which was terminated by the taking of Sevastopol (September 1855) and the treaty of Paris (March 30, 1856). By that important document Russia reluctantly consented to a strict limitation of her armaments in the Black Sea, to withdrawal from the mouths of the Danube by the retrocession of Bessarabia which she had annexed in 1812, and finally a cession of the island of Corfu in interposition between the sultan and his Christian subjects. Nicholas did not live to experience this humiliation. He had died at St Peterburg on the 2nd of March 1855 and had been succeeded by his eldest son, Alexander II.

The first decade of Alexander's reign is commonly known in Russia as "the epoch of the great reforms," and may be described as a violent reaction against the political and intellectual stagnation of the preceding period. The repressive system of Nicholas, in which all other public interests were sacrificed to that of making Russia a great military power, the guardian of order in Europe and the predominant factor in the Eastern Question, had been tried and found wanting. Ending in a military disaster and a diplomatic humiliation, it had failed to attain even the narrow object for which it had been created. This was clearly perceived and keenly felt by the educated classes, and as soon as the strong hand of the uncompromising autocrat was withdrawn, they clamoured loudly for radical changes in the aims and methods of their rulers. Russia must adopt, it was said, those enlightened principles and liberal institutions which made the Western nations superior to her not only in the arts of peace but even in the art of war; only by imitating her rivals could she hope to overtake and surpass them in the race of progress. On that subject there was wonderful unanimity, and the few persons who could not join in the chorus had the prudence to remain silent. For the first time in the history of Russia public opinion in the modern sense became a power in the state and influenced strongly the policy of the government. Though the young emperor was of too phlegmatic a temperament to be carried away by the prevailing excitement and of too practical a turn of mind to adopt wholesale the doctrinaire theories of his self-constituted, irresponsible advisers, he recognized that great administrative and economic changes were required, and after a short period of hesitation he entered on a series of drastic reforms, of which the most important were the emancipation of the serfs, the thorough reorganization of the judicial administration and the development of local self-government. All these measures, in which the humble, but far-seeing, Nicholas had received the sympathy, support and co-operation of the more enlightened of his subjects, were successfully accomplished. The serfs were liberated entirely from the arbitrary rule of the landowners and became proprietors of the communal land; the old tribunals which could be justly described as "dens of iniquity and incompetence," were replaced by civil and criminal lawcourts of the French type, in which justice was dispensed by trained jurists according to codified legislation, and from which the traditional bribery and corruption were rigidly excluded; and the administration of local affairs—roads, schools, hospitals, &c.—was entrusted to provincial and district councils freely elected by all classes of the population. In addition to these great and beneficent changes, means were taken for developing more rapidly the

vast natural resources of the country, public instruction received an unprecedented impetus, a considerable amount of liberty was accomplished in the education system, and a strong spirit of liberalism pervaded rapidly all sections of the educated classes, a new imaginative and critical literature dealing with economic, philosophical and political questions sprang into existence, and for a time the young generation fondly imagined that Russia, awakening from her traditional lethargy, was about to overtake, and soon to surpass, on the path of national progress, the older nations of western Europe.

These sanguine expectations were not fully realized. The economic and moral condition of the peasantry was little improved by freedom, and in many districts there were signs of positive impoverishment and demoralization. The local self-government institutions after a short period of feverish and not always well-directed activity, showed symptoms of organic exhaustion. The reformed tribunals, though incomparably better than their predecessors, did not give universal satisfaction. In the imperial administration, the corruption and long-established abuses which had momentarily vanished, began to reappear. Industrial enterprises did not always succeed. Education produced many unforeseen and undesirable practical results. The liberty of the press not infrequently degenerated into licence, and sate liberalism was often replaced by socialistic dreaming. In short, it became only too evident that there was no royal road to national prosperity, and that Russia, like other nations, must be content to advance slowly and laboriously along the rough path of painful experience. In these circumstances sanguine enthusiasm naturally gave way to despondency, and the reforming zeal of the government was replaced by tendencies of a decidedly reactionary kind. Partly from disappointment and nervous exhaustion, and partly from a conviction that the country required rest in order to judge the practical results of the reforms already accomplished, the tsar refrained from further initiating new legislation, and the government gave it to be understood that the epoch of the great reforms was closed.

In the younger ranks of the educated classes this state of things produced the conception of the Russian people as conservative and paralyzing, which was soon found vent in revolutionary agitation. At first the agitation was of an academic character and was dealt with by the press-censure; but it gradually took the form of secret associations, and the police had to interfere.

There were no great, well-organized secret societies, but there were many small groups, composed chiefly of male and female students of the universities and technical schools, which worked independently for a common purpose. Finding that the walls of autocracy could not be overturned by blasts of revolutionary trumpets in the periodical press and in clandestinely printed seditious proclamations, the young enthusiasts determined to seek the support of the masses, or, as they termed it, "to go in among the people" (idiot v narod). Under the disguise of doctors, midwives, school teachers, governors, factory hands or common labourers, they sought to make proselytes among the working classes, the lower classes in the industrial centres, the revolutionary pamphlets and oral communications. At first the propaganda had very little success, because the uneducated peasants and factory workers could not understand the phraseology and abstract principles of socialism; but when the propagandists descended to a lower platform and spread rumours that the tsar had given all the land to the peasants, and was prevented by the proprietors and officials from carrying out his benevolent intentions, there was a serious danger of agrarian disorders, and energetic measures were adopted by the authorities. Wholesale arrests were made by the police, and many of the accused were imprisoned or exiled to distant provinces, some by the regular tribunals, and others by so-called "administrative procedure" without a formal trial. The activity of the police and the sufferings of the victims naturally produced intense excitement and bitterness among those who escaped arrest, and a secret organization calling itself the Executive Committee, announces in its clandestinely printed organs that the functionaries who distinguished themselves in the suppression of the propaganda would be "removed." A number of prominent officials were accordingly condemned to death by this secret terrorist tribunal, and in some cases the sentences were carried out. General Mezentsov, the head of the political police, was assassinated in broad daylight in one of the principal streets of St. Petersburg, and in the provinces a good many officials of various grades shared the same fate. As these acts of terrorism had quite the opposite of the desired effect, repeated attempts were made on the life of the emperor, and at last the carefully laid plans of the conspirators were successful. On the 13th of March 1881, when returning from a military parade to the Winter Palace, Alexander II. was terribly wounded by the explosion of a bomb, and died shortly afterwards. (For details of this revolutionary movement, see Ninilism.)

In respect of foreign policy the reign of Alexander II. differed widely from that of Nicholas. The Eastern Colossus no longer inspired respect and fear in Europe. Until the country had completely recovered from the exhaustion of the Crimean War the government remained in the background of European politics. Its attitude was graphically described in the famous declaration of Prince Gorchakov: "La Russie ne boude pas; elle se recueille." On one point, however, this description was not accurate; Russia sulked so far as Austria was concerned, for she could not forget that the emperor Francis Joseph, by his waving and unfriendly conduct towards her during the Crimean War, had ill repaid her assistance to the Habsburg Monarchy in 1849, and had fulfilled the cynical prediction of Prince Schwarzenberg that his country would astonish the world by her ingratitude. It was not without secret satisfaction, therefore, that Prince Gorchakov watched the repeated defeats of the Austrian army in the Italian campaign of 1859, and he felt inclined to respond to the advances made to him by Napoleon III.; but the gerr of a Russo-French alliance, which had come into existence immediately after the Crimean War, ripened very slowly, and they were completely destroyed in 1863 when the French emperor wounded Russian sensibilities deeply by giving moral and diplomatic support to the Polish insurgents. One occasion, however, helped Gorchakov to ward off the threatened intervention of France and England, and he thereby founded the cordial relations which subsisted between the cabinets of Berlin and St. Petersburg down to 1878, and which contributed powerfully to the creation of the German empire by defending the Prussian cabinet against the jealousy and enmity of Austria and France. In return for these services Bismarck helped Russia to recover a portion of what she had lost by the Crimean War, for it was thanks to his connivance and diplomatic support that she was able in 1871 to denounce with impunity the clauses of the treaty of Paris which limited Russian armament in the Black Sea. Had the tsar been satisfied with this important success, which enabled him to rebuild Sevastopol and construct a Black Sea fleet, his reign might have been a peaceful and prosperous one, but he tried to recover the remainder of what was lost by the Crimean War, the provinces of Bessarabia and predominant influence in Turkey. To effect this, he embarked on the Turkish War of 1877-78, which ended in disappointment. Though the campaign enabled him to recover Bessarabia at the expense of his Rumanian ally, it did not increase Russian prestige in the East, because the Russian army was repeatedly repulsed by the Turks, and when at last it reached Constantinople, it was prevented from entering the city by the threatening attitude of England and Austria. In the field of diplomacy there was likewise disappointment. The concessions extorted from the Porte in the preliminary treaty of San Stefano (March 3, 1878) were revised and considerably modified in favour of Turkey by the congress of Berlin (June 13-July 13, 1878); see Europe: History.

Much greater success attended the efforts of Russian diplomacy and Russian arms in Asia. By the treaty of Aigun (May 28, 1858), and without any military operations, thecession of a great part of the basin of the Amur was obtained from China. Six years later began the rapid expansion of Russia in Central Asia, and at the end
of Alexander II.'s reign her domination had been firmly established throughout nearly the whole of the vast expanse of territory lying between Siberia on the north and Persia and Afghanistan on the south, and stretching without interruption from the eastern coast of the Caspian to the Chinese frontier. The greater part of the territory was formally incorporated into the empire, and the petty potentates, such as the khan of Khiva and the amir of Bokhara, who were allowed to retain a semblance of their former sovereignty, became obscureous vassals of the White Tsar.

The assassination of Alexander II. by the terrorists made a profound impression on his son and successor, and determined the general character of his rule. Alexander III. (1881–94), who had never sympathized with liberalism in any form, entered frankly on a reactionary policy, which was pursued consistently during the whole of his reign. He could not, of course, undo the great reforms of his predecessor, but he amended them in such a way as to counteract what he considered the exaggerations of liberalism. Local self-government in the village communities, the municipalities and the towns was carefully restricted, and placed to a greater extent under the control of the regular officials. The reformers of the previous reign had endeavoured to make the emancipated peasantry administratively and economically independent of the landed proprietors; the conservatives of this later era, proceeding on the assumption that the peasants did not know how to make a proper use of the liberty prematurely conferred upon them, endeavoured to re-establish the influence of the landed proprietors by appointing from amongst them "land-chiefs," who were to exercise over the peasants of their district a certain amount of patriarchal jurisdiction. The reformers of the previous reign had sought to make the new local administration (zemstvo) a system of genuine rural self-government and a basis for future parliamentary institutions; these later conservatives transformed it into a mere branch of the ordinary state administration, and took precautions against its ever assuming a political character. Even municipal institutions, which had never shown much vitality, were subjected to similar restrictions.

In short, the various forms of local self-government, which were intended to raise the nation gradually to the higher political level of western Europe, were condemned as unsuited to the national character and traditions, and as productive of disorder and demoralization. They were accordingly replaced in great measure by the old autocratic methods of administration, and much of the administrative corruption which had been cured, or at least repressed, by the reform enthusiasm again flourished luxuriantly.

In a small but influential section of the educated classes there was a conviction that the revolutionary tendencies, which culminated in Nihilism and Anarchism, proceeded from the adoption of cosmopolitan rather than national principles in all spheres of educational and administrative activity, and that the best remedy for the evils from which the country was suffering was to be found in a return to the three great principles of Nationality, Orthodoxy and Autocracy. This doctrine, which had been invented by the Slavophils of a previous generation, was early instilled into the mind of Alexander III. by Pobédonostsev (g.e.), who was one of his teachers, and later his most trusted adviser, and its influence can be traced in all the more important acts of the government during that monarch's reign. His determination to maintain autocracy was officially proclaimed a few days after his accession. Nationality and Eastern Orthodoxy, which are so closely connected as to be almost blended together in the Russian mind, received not less attention. Even in European Russia the regions near the frontier contain a great variety of nationalities, languages and religions. In Finland the population is composed of Finnish-speaking and Swedish-speaking Protestants; the Baltic provinces are inhabited by German-speaking, Lett-speaking and Esth-speaking Lutherans; the inhabitants of the south-western provinces are chiefly Polish-speaking Roman Catholics and Yiddish-speaking Jews; in the Crimea and on the Middle Volga there are a considerable number of Tatar-speaking Mahomedans; and in the Caucasus there is a conglomeration of races and languages such as is to be found on no other portion of the earth's surface. Until recent times these various nationalities were allowed to retain un molested the language, religion and peculiar local administration of their ancestors; but when the new nationality doctrine came into fashion, attempts were made to spread among them the language, religion and administrative institutions of the dominant race. In the reigns of Nicholas I. and Alexander II. these attempts were merely occasional and intermittent; under Alexander III. they were made systematically and with very little consideration for the feelings, wishes and interests of the people concerned. The local institutions were assimilated to those of the purely Russian provinces; the use of the Russian language was made obligatory in the administration, in the tribunals and to some extent in the schools; the spread of Eastern Orthodoxy was encouraged by the authorities, whilst the other confessions were placed under severe restrictions; foreigners were prohibited from possessing landed property; and in some provinces administrative measures were taken for making the land pass into the hands of Orthodox Russians. In this process some of the local officials displayed probably an amount of zeal beyond the intentions of the government, but any attempt to oppose the movement was rigorously punished. Of all the various races the Jews were the most severely treated. The great majority of them had long been confined to the western and south-western provinces. In the rest of the country they had not been allowed to reside in the villages, because their habits of keeping vodka-shops and lending money at usurious interest were found to demoralize the peasantry, and even in the towns their numbers and occupations had been restricted by the authorities. But, partly from the usual laxity of the administration and partly from the readiness of the Jews to conciliate the needy officials, the rules had been by no means strictly applied. As soon as this fact became known to Alexander III., he ordered the rules to be strictly carried out, without considering what an enormous amount of hardship and suffering such an order entailed. He also caused new rules to be enacted by which his Jewish subjects were heavily handicapped in education and professional advancement. In short, complete Russification of all non-Russian populations and institutions was the chief aim of the government in home affairs.

In the foreign policy of the empire Alexander III. likewise introduced considerable changes. During his father's reign its main objects were: in the west, the maintenance of the alliance with Germany; in south-eastern Europe, the recovery of what had been lost by the Crimean War, the gradual weakening of the Sultan's authority, and the increase of Russian influence among the minor Slav nationalities; in Asia, the gradual but cautious expansion of Russian domination. In the reign of Alexander III. the first of these objects was abandoned. In 1881, during his accession, the bonds of friendship which united Russia to Germany had been weakened by the action of Bismarck in giving to the cabinet of St Petersburg at the Berlin congress less diplomatic support than was expected, and by the Austro-German treaty of alliance (October 1879), concluded avowedly for the purpose of opposing Russian aggression; but the old relations were partly re-established by secret negotiations in 1880, by a meeting of the young tsar and the old emperor at Dannzig in 1881, and by the meeting of the three emperors at Skiermierewice in 1884, by which the Three Emperors' League was reconstituted for a term of three years (see Europe: History). Gradually, however, a great change took place in the tsar's views with regard to the German alliance. He suspected Bismarck of harbouring hostile designs against Russia, and he came to recognize that the permanent weakening of France was not in accordance with Russian political interests. He determined, therefore, to oppose any further disturbance of the balance of power in favour
of Germany, and when the treaty of Klichniewsk expired in 1887 he declined to renew it. From that time Russia gravitated slowly towards an alliance with France, and sought to create a counterpoise against the Triple Alliance of Germany, Austria and Italy. The tsar was reluctant to bind himself by a formal treaty, because the French government did not offer the requisite guarantees of stability, and because he feared that it might be induced, by the prospect of Russian support, to assume an aggressive attitude towards Germany. He recognized, however, that in the event of a great European war the two nations would in all probability be found fighting on the same side, and that if they made no preparations for concerted military action they would be placed at a grave disadvantage in comparison with their opponents of the Triple Alliance, who were believed to have already worked out an elaborate plan of campaign. In view of this contingency the Russian and French military authorities studied the military questions in common, and the result of their labours was the preparation of a military convention, which was finally ratified in 1894. During this period the relations between the two governments and the two countries became much more cordial. In the summer of 1891 the visit to Kronstadt of a French squadron under Admiral Gervais was made the occasion for an enthusiastic demonstration in favour of a Franco-Russian alliance; a few years later, on 30 October 1893, still more enthusiastic reception was given to the Russian Admiral Avelan and his officers when they visited Toulon and Paris. But it was not till after the death of Alexander III. that the word “alliance” was used publicly by official personages. In 1895 the term was first publicly employed by M. Ribot, then president of the council, in the Chamber of Deputies, but the expressions he used were so vague that they did not entirely remove the prevailing doubts as to the existence of a formal treaty. Two years later (August 1897), during the official visit of M. Félix Faure to St Petersburg, a little more light was thrown on the subject. In the complimentary speeches delivered by the president of the French Republic and the tsar, France and Russia were referred to as allies, and the term “nations alliées” was afterwards repeatedly used on occasions of a similar kind.

In south-eastern Europe Alexander III. adopted an attitude of reserve and expectancy. He greatly increased and strengthened his Black Sea fleet, so as to be ready for any emergency that might arise, and in June 1886, contrary to the declaration made at the Congress of Berlin (art. 59), he ordered the Ruthenians to be transformed into a fortified naval port, but in the Balkan Peninsula he persistently refrained, under a good deal of provocation, from any intervention that might lead to a European war. The Bulgarian government, first under Prince Alexander and afterwards under the direction of M. Stamboloff, pursued systematically an anti-Russian policy, but the cabinet of St Petersburg confined itself officially to breaking off diplomatic relations and making diplomatic protests, and unofficially to giving tacit encouragement to revolutionary agitation.

In Asia, during the reign of Alexander III. the expansion of Russian domination made considerable progress. A few weeks after his accession he sanctioned the annexation of the territory of the Tekke Turkmans, which had been conquered by General Skobelev, and in 1884 he formally annexed the Merv oasis without military operations. He then allowed the military authorities to push forward in the direction of Afghanistan, until in March 1885 an engagement took place between Russian and Afghan forces at Panjdeh. Thereupon the British government, which had been for some time carrying on negotiations with the cabinet of St Petersburg for a delimitation of the frontier, intervened energetically and prepared for war; but a compromise was effected, and after more than two years of negotiation a delimitation convention was signed at St Petersburg on 20th July 1887. The forward movement of Russia was thus stopped in the direction of Herat, but it continued with great activity farther east in the region of the Pamirs, until another Anglo-Russian convention was signed in 1895. During the whole reign of Alexander III. the increase of territory in Central Asia is calculated by Russian authorities at 425,895 square kilometres.

On 1st November 1894 Alexander III. died, and was succeeded by his son, Nicholas II., who, partly from similarity of character and partly from veneration for his father's memory, continued the existing lines of policy in home and foreign affairs. The expectations entertained in many quarters that great legislative changes would at once be made in a liberal sense was not realized. When an influential deputation from the province of Tver, which had long enjoyed a reputation for liberalism, ventured to hint in a loyal address that the time had come for changes in the existing autocratic régime, they received a reply which showed that the emperor had no intention of making any such changes. Private suggestions in the same sense, offered directly and respectfully, were no better received, and no important changes were made in the legislation of the preceding reign. But a great alteration took place noiselessly in the manner of carrying out the laws and ministerial circulars. Though resembling his father in the main points of his character, the young tsar was of a more humane disposition, and he was much less of a doctrinaire. With his father's aspiration of making Holy Russia a homogeneous empire he thoroughly sympathized, but he strenuously, and systematically persevered in his policy of discrimination of Jews, heretics and schismatics to which his father had given rise, and he let it be understood, without any formal order or proclamation, that the severe measures hitherto employed would not meet with his approval. The officials were not slow to take the hint, and their undue zeal at once disappeared. Nicholas II. showed, however, that his father's policy of Russification was neither to be reversed nor to be abandoned. When an influential deputation was sent from Finland to St Petersburg to represent to him respectfully that the officials were infringing the local rights and privileges solemnly accorded at the time of the annexation, it was refused an audience, and the leaders of the movement were informed indirectly that local interests must be subordinated to the general welfare of the empire. In accordance with this declaration, the policy of Russification in Finland was steadily maintained, and caused much disappointment, not only to the Finlanders, but also to the other nationalities who desired the preservation of their ancient rights.

In foreign affairs Nicholas II. likewise continued the policy of his predecessor, with certain modifications suggested by the circumstances. He strengthened the cordial understanding with France by a formal agreement, the terms of which were not divulged, but he never encouraged the French government in any aggressive designs, and he maintained friendly relations with Germany. In the Balkan Peninsula a slight change of attitude took place. Alexander III., indifferent at what he considered the ingratitude of the Slav nationalities, remained coldly aloof, as far as possible, from all intervention in their affairs. About three months after his death, de Giers, who thoroughly approved of this attitude, died (20th January 1895), and his successor, Prince Lobanov, minister of foreign affairs from 10th March 1895 to 30th August 1896, endeavoured to recover what he considered Russia's legitimate influence in the Slav world. For this purpose Russian diplomacy became more active in south-eastern Europe. The result was perceived first in Montenegro and Servia, and then in Bulgaria. Prince Ferdinand of Bulgaria had long been anxious to localize his position by a reconciliation, and as soon as he got rid of Stamboloff he made advances to the Russian government. They were well received, and a reconciliation was effected on certain conditions which the prince, his eldest son and heir should become a member of the Eastern Orthodox Church. As another means of opposing Western influence in south-eastern Europe, Prince Lobanov inclined to the policy of protecting rather than weakening the Ottoman empire. When the British government seemed disposed to use coercive measures for the protection of the Armenians, he gave it clearly to be understood that any such proceeding would be opposed by Russia. After Prince Lobanov's death and the appointment
of Count Muraviev as his successor in January 1897, this tendency of Russian policy became less marked. In April 1897, it is true, when the Greeks provoked a war with Turkey, they received no support from St. Petersburg, but at the close of the war the tsar showed himself more friendly to them; and afterwards, when it proved extremely difficult to find a suitable person as governor-general of Crete (see Crete), he recommended the appointment of his cousin, Prince George of Greece—a selection which was pretty sure to accelerate the union of the island with the Hellenic kingdom. How far the recommendation was due to personal feeling, as opposed to political considerations, it is impossible to say.

In Asia, after the accession of Nicholas II., the expansion of Russia, following the line of least resistance and stimulated by the construction of the Trans-Siberian railway, took the direction of northern China and the effete little kingdom of Korea. A great part of the eastern section of the railway was constructed on Chinese territory, and elaborate preparations were made for bringing Manchuria within the sphere of Russian influence. With this view, the cabinet of St. Petersburg, at the close of the Chino-Japanese War in 1895, objected to all annexations by Japan in that quarter, and insisted on having the treaties of Shimonosuki annulled. Subsequently, by obtaining from the Tsungli-Yamen a long lease of Port Arthur and Taliensan and a concession to unite those ports with the Trans-Siberian by a branch line, she tightened her hold on that portion of the Chinese empire and prepared to complete the work of aggression by so-called “spontaneous infiltration.” From Manchuria, it was assumed, the political influence and spontaneous infiltration would naturally spread to Korea, and on the deeply indented coast of the Hermit Kingdom might be constructed new ports and arsenals more spacious and strategically more important than Port Arthur.

This grandiose project was unexpectedly destroyed by the energetic resistance of Japan, who had ear-marked the Hermit Kingdom for herself, and who declared plainly that she would never tolerate the exclusive influence of Russia in Manchuria. In vain the Russian diplomatists sought to overcome her opposition by dilatory negotiations, in the firm conviction that a small island kingdom in the Pacific would never have the audacity to attack a power which had conquered and absorbed the whole of northern China. Subsequently, by obtaining from the Tsungli-Yamen lease of Port Arthur and Taliensan, and a concession to unite those ports with the Trans-Siberian, she tightened her hold on that portion of the Chinese empire and prepared to complete the work of aggression by so-called “spontaneous infiltration.” From Manchuria, it was assumed, the political influence and spontaneous infiltration would naturally spread to Korea, and on the deeply indented coast of the Hermit Kingdom might be constructed new ports and arsenals more spacious and strategically more important than Port Arthur.

Revolutionary movement in Russia. The supreme peril to the conclusion of peace was the fact that the Russian government was hampered by internal troubles. The old Liberal movement and the terrorist organizations which had been suppressed by Alexander III. were being resuscitated, and the liberal and revolutionary leaders, taking advantage of the unpopularity of the war, were agitating for the convocation of a Constituent Assembly, which should replace the hated bureaucratic régime by democratic institutions. With great reluctance the tsar consented to convocate a consultative chamber of deputies as a sop to public opinion, but that concession stimulated rather than calmed public opinion, and added the whole country to the terrorized peasantry, the liberals, and the Revolutionaries, combining their forces, brought about a general strike in St. Petersburg together with the stoppage of railway communication all over the empire. Panic-striken for a moment, the government issued a manifesto proclaiming Liberal principles and promising in vague language all manner of political reforms (October 30, 1905), and when the inordinate expectations created by this extraordinary document were not at once realized, preparations were made for overthrowing the existing régime by means of an armed insurrection. Many revolutionaries believed that the end of autocracy had come, and an extemporized Council of Labour Deputies, anxious to play the part of a Comité de Salut Public, was ready to take over the supreme power and exercise it in the interests of the proletariat.

In reality the revolutionary movement was not so strong and the government not so weak as was generally supposed. Mutinies occurred, it is true, during the next few weeks in Kronstadt and Sevastopol, and in December there was street-fighting for several days in Moscow, but such serious disorders were speedily suppressed, and thereafter the revolutionary manifestations were confined to mass meetings, processions with red flags, attempts on the lives of officials and policemen, robberies under arms and agrarian disturbances.

Notwithstanding the unsatisfactory results of the October manifestó the tsar kept his promise of convoking a legislative assembly, and on the 10th of May 1906 the first Duma was opened by his majesty in person; but it was so systematically and violently hostile to the government and so determined to obtain executive, in addition to its legislative, functions, that it was dissolved on the 23rd of July without any legislative work being accomplished. The second Duma, which met on the 5th of March 1907, avoided some of the mistakes of its predecessor control, but as a legislative assembly it showed itself equally incompetent, and a large section of its members were implicated in a well-organized attempt to spread sedition in the army by revolutionary propaganda. It was dissolved, therefore, on the 16th of June 1907, and the electoral law which had given such unsatisfactory results was modified by imperial ukase.

The third Duma was subsequently convoked for the 14th of November 1907. (D. M. W.)

Development of the Russian Constitution.—At the end of 1910 the Russian revolution, which seemed at one time to promise an overturn as complete as that of the ancien régime in France, would seem to have entered on a path of orderly and conservative development, and it is possible, now that the smoke of combat has cleared away, to form some estimate of the forces through the interplay of which this result has been achieved. At the outset the superficial resemblance between the revolutionary movement in Russia and that of 1789 in France was striking: there was the same breakdown of the traditional machinery of government, the same general pressure for reform, but as a legislative assembly it showed itself equally incompetent, and a large section of its members were implicated in a well-organized attempt to spread sedition in the army, popular fêmes, the assassination of unpopular officials, and the burning of country houses by organized bands of peasants. Similar, too, was the revolution, when freedom of speech was at last allowed, of the unhappy effect of the long divorce of the intellect of the country from any experience of practical politics. But here the analogy breaks down. France in 1789, though its ancient provincial boundaries survived, had long since been welded into a nation conscious of its common interests; Russia remains a vast empire, composed of the most heterogeneous, sometimes even mutually hostile, elements, whose antagonisms were bound to be an element of weakness in any assembly truly representative of all sections of the people. In France the Revolution had been the work of the middle classes; in Russia an indigenous middle class has, comparatively speaking, no existence, the peasants forming the overwhelming majority of the population. The supreme peril to the autocracy in Russia lay in the genuine grievances of the peasants, less political than economic, which agitated the land-hunger satisfied, the peasants would become a bulwark of the established order, whatever that might be, as had happened in similar circumstances in Austria in 1849. As for the revolutionary "intellectuals," without the lever of agrarian discontent they

1 In 1897 only 13% of the population were engaged in commerce or industry, including the work-people. Of the middle class, moreover, a large proportion were Jews and Germans. The peasants numbered 75%.
were practically powerless, the more so as their political activity consisted mainly in "building theories for an imaginary world." The bourgeoisie revolutionists of France had all been philosophers, but the Russian philosophy had at least paid lip-service to "reason;" the Russian revolutionists who formed the majority of the first and second Dumas, as though inspired by the exalted nonsense preached by Tolstoy, subordinated reason to sentiment, until—

their impracticable temper having been advertised to all the world—it became easy for the government to treat them as a mere excrescence on the national life, a malignant growth to be removed by a necessary operation. In 1909 the number of exiles for political reasons from Russia was reckoned at 180,000; but the third Duma, purged and packed by an ingenious franchise system, was in its third year passing measures of beneficent legislation, in complete harmony with the government. It is proposed to trace briefly the steps by which this result was obtained.

In order to explain the course of the revolution which came to a head in 1905 it is necessary to say a few words about constitutional plans and liberal experiments, initiated from above, which had preceded it. Of the ancient zemski sobor, which had played a considerable part in the struggle of the tsars against the great boyars in the 17th century, had met but once since the days of Peter the Great. The origin of the present constitution of Russia must be sought, not in this ancient and obsolete institution, but in the artificial constitution elaborated by Mikhail Speranski (g.v.) in 1809 at the instance of the emperor Alexander I. Of Speranski's plan only the establishment of the Imperial Council (January 1st, 1810) was realized in his lifetime. In 1864, however, the emperor Alexander II. carried the scheme a step further by the creation of elected provincial assemblies (zemstvos), to which in 1870 elected municipal councils (dumas) were added. The opportunity thus given for debate naturally stimulated the movement in favour of constitutional government, which received new impulses from the sympathetic attitude of the emperor Alexander II., his grant in 1879 of a constitution to the liberal prince of Lieven, the emanation of Nihilist outrages which pointed to the necessity of conciliating Liberal opinion in order to present a united front against revolutionary agitation. In January 1881 Count Loris-Melikov, minister of the interior, proposed to convene a "general commission" to examine legislative proposals before these were laid before the Imperial Council; this commission was to consist of members elected by the zemstvos and the larger towns, and others nominated in the provinces having no zemstvos. The plan was approved by Alexander II. on the very morning of his assassination (February 17th, 1881), but it was never promulgated. The new tsar, Alexander III., was an apt pupil of his tutor Pobedonostsev (g.v.), the celebrated procurator of the Holy Synod, for whom the representative system was a modern lie, and his reign covered a period of frank reaction, during which there was not only no question of granting any fresh liberties but those already conceded (e.g. the principle of the separation of the administrative and judicial functions) were largely withdrawn. The result of this policy of repression, associated as it was with gross incompetence and corruption in the organs of the administration, was the rapid spread of the revolutionary movement, which gradually permeated the intelligent classes and ultimately affected even the stolid and apparently immovable masses of the peasantry.

The movement came to a head, as a result of the disasters of the war with Japan, in 1904. The assassination of the minister of the interior Plehve, on the 14th of July, by the revolutionist Sazonov was remarkable as a symptom mainly owing to the widespread sympathy of the European press of all shades of opinion with the motives of the assassin. It was clear that the system with which the murdered minister's name had been associated stood all but universally condemned, and in the appointment of the conciliatory Prince Sviatopolk-Mirski as his successor the tsar himself seemed to concede the necessity for a change of policy. In November, with the tacit consent of the police, a private assembly of eminent members of local zemstvos and municipal dumas was held in St Petersburg to discuss the situation. The majority of this decided to approach the crown with a suggestion for a reform of the Russian system on the basis of a national representative assembly, an extension of local self-government, and a new constitution for individual liberty. The day on which the deputation laid these views before Prince Mirski was hailed by public opinion as recalling the 9th of May 1789, the date of the meeting of the French states-general at Versailles. The emperor, however, whatever his own views, was surrounded by reactionary influences, of which the most powerful were the empress-mother, Pobedonostsev the procurator of the Holy Synod, Count Muraviev and the Grand-duke Sergei. The imperial ukaz of the 12th of December enunciating reforms affecting the peasants, workmen and local zemstvos failed to satisfy public opinion; for there was no word in it of constitutional government. Petitions continued to flow in to the emperor's cabinet, praying for a national representation, from the zemstvos, from the nobles and from the professional classes, and their moral was enforced by general agitation, by partial strikes, and by outrages which culminated at Moscow in the murder of the Grand-duke Sergei (February 4th, 1905). In the imperial councils the resisting forces still seemed to have the upper hand. Prince Mirski resigned, his resignation being immediately followed by a reactionary imperial manifesto reaffirming the principle of autocracy (February 18th).

Bulygin, Mirski's successor, had no knowledge of this until after its publication; he hastened to the tsar and obtained the issue on the same day of a rescript which, while reserving the "fundamental laws of the empire" inviolate, stated the emperor's intention of summoning the representatives of the people to a "preparation and examination of legislative proposals." A commission of inquiry, under the emperor's presidency, was now established to elaborate the means for carrying this promise into effect. On the 6th of June, in reply to a deputation of the second congress of zemstvos headed by Prince Trubetskoi, the emperor promised the speedy convocation of a National Assembly. When, however, on the 6th of August, the new law was promulgated, it was found that the "Imperial Duma" was to be no more than a consultative body, charged with the examination of legislative proposals be the law which were before the Imperial Council, the duty of preparing and right of passing them into law being still reserved for the autocrat alone. The members of the Duma, moreover, were placed at the mercy of the government by a clause empowering the Directing Senate to suspend or deprive them. The promulgation of this truncated constitution was greeted by a furious agitation, culminating in September in a general strike, rightly described as the most remarkable political phenomenon of modern times. For days the whole mechanism of civilized existence in Russia was at a standstill, all intercourse

1 Tolstoj observed that that was argument and reason, and that he paid no attention to them; he only guided himself (he said) by sentiment, which he felt sure told him what was good and right—Interview with Metchnikoff in Sir Ray Lankester's The Soul of the Easy Chair, p. 4.

2 In his speech at the opening of the first Polish parliament at Warsaw in 1818, Alexander I. publicly announced his intention of granting free institutions to Russia.
with the outside world cut off; until at last the government was forced to yield, and on the 17th of October 1905 the tsar issued the famous manifesto promising to Russia a constitution based on the main principles of modern Liberalism: national representation, freedom of conscience and opinion, guarantees for individual liberty.

The enormous programme of constitutional reform shadowed in the manifesto had to be elaborated in haste by Count Witte, the minister of the interior, under circumstances by no means promising. The organs of government seemed paralysed by the repudiation of the principle on which their authority was based, and the empire to be in danger of falling into complete anarchy. The revolutionary terrorists took advantage of the situation to multiply outrages; popular agitation was fomented by a multitude of new journals preaching every kind of extravagant doctrine, now that the censor no longer dared to act; in December the trouble culminated, and (20 February) an rising in Moscow. The revolutionary terrorists were countered by the terrorists of the reaction who, under the name of the “Union of the Russian People,” began an organized extermination of the elements supposed to be hostile to the traditional régime. The “black band” (черная солома), or “black hundreds,” as they were branded by public opinion, directed their attacks especially against the Jews, and pogroms, i.e. organized wholesale robbery and murder of Jews, occurred in many places, it was believed with the connivance of the police and veiled approval in exalted quarters.

Meanwhile the political parties which were to divide the new Duma had taken shape. Apart from the extremists on one side or the other, frank reactionaries on the Right and Socialists on the Left, two main divisions of opinion revealed themselves in the congresses of the сенатские that met at Moscow in September and November. In the former there had been a fusion between the Radicals, supporters of the autonomy of Poland and a federal constitution for the empire, and the Independence party (Освобождение) formed by political exiles at Paris in 1903, the fusion taking the name of Constitutional Democrats, known (from a word-play on the initials K.D.) as “Cadets.” The more moderate elements found a rallying cry in the manifesto of October, took the name of “the Party of 17 October,” and became known as “Octobrists.” In the сенатском congress of November the “Cadets” protested against the “grant” of a constitution already elaborated, and demanded the convocation of a Constituent Assembly. The Octobrists, on the other hand, supported Count Witte’s moderate programme, the most important provisions of which were the extension (12 December 1905) of the suffrage under the stillborn constitution of December 1905, the retention of the Duma as the Lower House, and of the Imperial Council (half of which was to be elective) as the Upper House in the new parliament.

The elections were held in March 1906, and on the 27th of April the emperor Nicholas II. solemnly opened the first Duma of the Empire. The “Cadets” commanded an overwhelming majority in the Lower House, and their intractable temper and ignorance of affairs became at once apparent. The address in reply to the speech from the throne, voted after a debate in which abstract theories had triumphed over common sense, demanded universal suffrage, the establishment of pure parliamentary government, the abolition of capital punishment, the expropriation of the landlords, a political amnesty, and the suppression of the Imperial Council. When the minister of the interior, M. Goremykin, who had submitted Witte at the head of the government, met these preposterous demands with a flat refusal, the House voted, on the motion of M. Kuzmin-Karaviev, for an appeal to the people (July 4). Four days later the government dissolved the Duma, M. Goremykin at the same time being replaced by M. Stolypin. The “Cadets” refused to accept this action and, in imitation of the famous meeting in the tennis-court at Versailles, adjourned to Vyborg in Finland, where, under the presidency of the Duma, M. Murumtsov, they drew up and issued a manifesto calling on the Russian people to refuse taxes and military service. Its sole result, apart from the punishment which afterwards fell on its authors, was to show how little the majority of the dissolved Duma had represented the Russian people. Isolated mutinies in the army followed, and terrorist outrages here and there—notably, in August, the dastardly bomb outrage in the Isle of Apothecaries at St Petersburg, which seriously injured one of M. Stolypin’s little daughters; but the mass of the nation and of the army remained wholly unmoved, while the repetition of troubles was made more difficult by the establishment of field courts martial with summary powers.

The second Duma met on the 6th of March 1907. M. Stolypin had not ventured to alter the electoral law without parliamentary consent, but with the aid of a compliant Senate the provisions of the existing law were interpreted in a restrictive sense for the purpose of influencing the election. The result was, however, hardly more satisfactory to the government. The “Cadets,” it is true, lost many seats both to the Socialists and to the extreme Right, but they held the balance of the House, of which the Octobrists and the Right together only constituted one-fifth, and their leader, M. Golovin, was elected president of the House. The temper of the second Duma, was, indeed, even more democratic than that of the first; but M. Stolypin did his best to work in harmony with it, realizing that under the existing law another dissolution could but lead to a like result, and shrinking from the only alternative—an alteration of the law by a coup d’état, a course which could only be justified on the plea of extreme necessity. On the 19th of March he laid before the House his programme of reforms, which included the emancipation of the peasants from the control of the communes and the handing over to them of the crown lands and imperial estates. The majority, however, refused to be reconciled. The abolition of the field courts martial was demanded; on the 13th of April a bill for the expropriation of landlords was carried by a two-thirds majority, and the 30th the Army Bill would have been lost but for the Polish vote. The crisis came with the discovery of a treasonable plot for the subornation of the army, in which many Socialist members of the Duma were involved. On the 14th of June Stolypin’s proposal for the arrest of 16 members and the indictment of 55 was shelved by being referred to a committee. The excuse for which the government had been waiting was thus provided, and two days later the Duma was dissolved. An imperial ukaz fixed the new elections for the 14th of September, and the meeting of the third Duma for the 14th of November; at the same time, in violation of the October manifesto, the electoral law was altered, so as to secure a representation at once more Russian and more conservative. The non-Russian frontier provinces (окраины) had even before been under-represented (one member for every 350,000 inhabitants, as against one for every 250,000 in the central provinces); the members returned by Poland, the Caucasus and Siberia were now reduced from 89 to 39, those from the Central Asian steppes (23) were swept away altogether; the total number of deputies was reduced from 524 to 442. Even more drastic were the changes in the electoral machinery, by far the most complicated in Europe, established by the law of 1905. Of this M. Charles remarks that it would have been a revolutionary act even in republican France.

They were condemned in 1907 to three months’ imprisonment for the attack on the Right.

This was reversed, on the 8th of June, by 238 votes to 191, after a patient exposition by M. Stolypin of the fact that there was plenty of land in Russia for the peasants without any attack on private property.

The electoral law covers 107 octavo pages.

---

1 Pogrom = pillage, destruction.
2 See the section Government and Administration, above.
3 Of this M. Charles remarks that it would have been a revolutionary act even in republican France.
4 They were condemned in 1907 to three months’ imprisonment for the attack on the Right.
5 This was reversed, on the 8th of June, by 238 votes to 191, after a patient exposition by M. Stolypin of the fact that there was plenty of land in Russia for the peasants without any attack on private property.
Meanwhile the pan-Russian movement had been gaining pace. At first it had seemed that the new birth of Russia would lead to a revival of pan-Slavism, directed not, as in the middle of the 19th century, against Austria but against Germany. In May 1908 a delegation of the Slav members of the Austrian Reichsrat paid a ceremonial visit to the Duma at St Petersburg, and in this "neo-Slav" demonstration M. Dmowski, leader of the Polish party in the Duma, took part. In the following year, however, the situation was completely altered, a result due to the growing anti-Polish feeling in the Duma and, more especially, to the support given by the Austrian Slavs to the annexation of Bosnia and Herzegovina. This event caused the utmost excitement in Russia; the crown prince of Servia, who arrived in St Petersburg on the 28th of October to ask for the armed assistance of the tsar, was received with enthusiasm by all classes of the people; and, though armed intervention was impossible, M. Tisseyre took the lead in the abolition of press freedom for an European conference (see EUROPE: History). Neo-Slav dreams were now replaced by a passionate desire to consolidate the Russian empire on a purely Russian basis. Even the remnant of the "Cadets" had by this time renounced their sympathy with Polish aspirations, and in the matter of Finland the Duma proved itself even more imperial than the emperor himself. The Finnish question is dealt with elsewhere (see FINLAND: History). Here it may suffice to mention, as illustrating the changed temper of the Russian national assembly, that the Russian majority of the Duma included among the imperial questions in Finland which the Finnish diet ought to refer to the imperial legislature not only all military matters—as the tsar demanded (Rescript of October 14)—but the question of the use of the Russian language in the grand-duchy, the principles of the Finnish administration, police, justice, education, formation of business companies, the divorce law, and even the right of the people to the public meeting, the press, the customs tariff, the monetary system, means of communication, and the pilot and lighthouse system. The old tendency illustrated by the outcome of the revolutionary movements of 1848 was once more in evidence—the tendency of merely artificial theories of democratic liberty to succumb to the immemorial instinct of race and race ascendency.

As an international force Russia had been, of course, all but completely crippled by the outcome of the Japanese War and the subsequent revolution. Her recovery, however, revealed the immense reserves of her strength. On the 30th of July 1907 she signed a convention with Japan of mutual respect for treaty and territorial rights, and guaranteeing the integrity of China. On the 31st of August of the same year the long period of mutual suspicion between Great Britain and Russia was closed by a convention by which the two Powers agreed to respect each other's interests in Central Asia and China, and to hold forth to the various powers their joint determination to prevent any hostile act in that region. The relation between Russia and Turkey was settled by the Convention of San Stefano in 1878, and the relations between the two powers were, so far as regards trade, greatly simplified by the signing of a commercial treaty in 1879.
RUSSIAN LANGUAGE. For the characteristics which this special branch of the Slavonic family shares with the rest, for a table showing the Russian alphabet and the transliterations of proper names used in this and in other (non-linguistic) articles of the Encyclopædia, and for the points which distinguish Slavonic alike from the Southern (Balkan) and from the North-Western (Polish, Czech, &c.) branches of Slavonic, see SLAVS. These latter points, fully treated under corresponding sections of the article SLAVS, are here summarized:—

I. Proto-Slavonic (Proto-SL) half vowels a and i have disappeared as such: a (b), though still written at the ends of words, is mute; it serves but to show that the following consonant is "hard." See V. below for "hard" and "soft" (denoted by ') consonants, not the "hard" = surd, tensis, "soft" = sonant, media of Eng. usage. Where a vowel was indispensable to help out a group of consonants, a has been replaced by o or e, but these vowels sometimes appear without such justification (e.g. ogen, Lat. ignis); if so when needed becomes e, otherwise it disappears or else leaves a trace in the "softness" of the preceding consonant, in which case it is still written: Old Slavonic (O.S.), stam, "sleep"; dina, "day"; rodn (a mute), dina(d'en').

II. Proto-SL survives in R. and Polish. The sound is a high-mixed-nasal; it is pronounced with the lips as for r and the tongue as for u, not unlike Eng. y in "rhythm." After labials there is a distinct u sound before the vowel. After gutturals it has become i.

III. Treatment of Liquids: retention of r' instead of the r of N.W. Slav.; retention as of Polish hard h (between i and w, not unlike Eng. l in "milk," "people"); helping out of sonant r and l by a vowel put in before r or l; especially the so-called full vocalism by which, e.g. Proto-SL *gordz, "town," became R. gorodz, O.S. gradz, Polish, gradz; Proto-SL *melko, "milk," R. moloko, O.S. melko, Polish, mleko.

IV. Proto-SL nasals: q. (Fr. on), became R. u; e (Fr. in), R. a; oS, put, "way;" pe, "five;" r. putt, p'utt.

V. Softening (Palatalization, &c): Proto-SL tj, dj gave R. t, z, Proto-SL *stejja, "candle;" *medja, "boundary;" R. stej, meša. Proto-SL tj, lj, lj, mj gave R. and S. Slav. pl, bl, ml, e.g. R. z' emla; Polish, zemia, "land." Before Proto-SL soft vowels e, j, i, t consonants were affected, the tongue being raised in anticipation of the narrow vowel, and so not making so clean a contact with the palate. Then what amounted to a new j developed in R., as it became narrow after j and i (orig. é) came to sound as fi, as at the beginning of a syllable, and all together with i began very much to soften the preceding consonant in literary R.; however, this new j never broke down the consonant into a palatalized sibilant or affricate, though it had this effect in White Russian (Wh. R.) and Polish.

The result is that almost every consonant in Russian can be pronounced "hard" or "soft," a distinction which is very difficult for a foreigner to make, as his tendency is to overdo the softness and pronounce a full j after the consonant instead of the palatal element melting into it. This is encouraged by the alphabetic system by which the letters ç ($), ñ, ñ, stand for je, jn, jn at the beginning of a syllable, but after a consonant merely indicate that the consonant is soft, the vowel being the same as in, y, a, (e, u, a), e.g. t stands for la rather than for jla. A soft consonant in its turn narrows the vowel before it, e.g. the vowel in jelt, *fr,* is like a in "Yale"; that is jelt,

* marks a hypothetical form
RUSSIAN LANGUAGE

...of the distinctions between the declensions, especially in the plural, the oblique cases of the simple, and the more curious forms of the compound, adjectival; in the verbs, of the supine, the imperfect, the aorist and the conditional (now reduced to a particle); but this simplification leaves it with six cases, Nom., Acc., Gen., Dat., Instrumental and Locative, three genders, three substantive declensions, -a, -o, -i, and traces of -u and consonantal stems, a special pronominial declension with many tricky forms, an adjective which takes its place between them, and a system of numerals in which a compromise between grammar and logic has produced a kind of maze. The forms of the verb are easier, as only the present indic. has three persons, the imperat. has but the 2nd, and the past is a participle, which, having discarded the copula, distinguishes only gender and number. The infinitive and four participles offer no special difficulty, but the gerundives or verbal adverbs, from the old masc. nom. sing., are troublesome. The curious mechanism by which these few verbal forms are by means of the aspects made to express most of our tenses and other shades of meaning of which even English is incapable, is briefly explained under Slaves. On the whole the syntax is simple, the periods which imitation of Latin and German once brought into fashion having given place to the shorter sentences of French and English models.

Such a language, though less difficult than it is generally supposed, is learned much better if some preliminary study is devoted to the accent, before the student launches out into conversation, as otherwise the habit may be acquired of disregarding the terminations and speaking very incorrectly.

Dialects.—Russian dialects fall into two main divisions—Great (Velikorusskij), including White (Belorus) Russian, and Little Russian (Malorusskij). The latter is spoken in a belt reaching from Galicia and the Northern Carpathians (see Ruthenians) through Podolia and Volhynia and the governments of Kiev, Chernigov, Poltava, Kharkov and the southern part of Voronezh and Smolensk to the Don and Kuban, upon which the Donetz Cossacks were compelled to move to the south of this belt; “New Russia” the population is much mixed, but little Russians on the whole predominate. In all there must be about 30,000,000 Little Russians.

The Great Russian division includes all other Russian speakers—the main body to the N. and E. of the Little Russians, the settlers in Siberia, the Caucasus and along the southern coast, the educated classes, officials and many towns and men throughout the empire, probably not less than 70,000,000 speakers exclusive of White Russians. On the whole it is very conservative, and therefore, in spite of its vast extent, is wonderfully uniform. It falls into two main dialect groups—the northern or a group and the southern or a group. The line between them runs roughly E.S.E. from Pskov to the Oka and then eastwards to the Urals. The northern group is the more conservative and pronounces very nearly according to the pattern of a, e, and i in gen., fem. and m. like u, while e before hard consonants is apt to be jo and before soft consonants i. The southern part of this group, comprising most of the governments of Vladimir and Yaroslavl with adjoining parts of Tver and Kostroma, are alone free from a further peculiarity, a tendency to mix up e and ɛ which can be traced in the ancient documents of Novgorod and has spread with the Novgorod colonists across the whole of N. Russia to the Urals and Siberia. These distant dialects have adopted many words from the Ugro-Finnish natives. The southern or a group of dialects pronounces unaccented o, e and even i as a or jo; with this goes a tendency to pronounce g as h, and to mix up u and o. The Moscow dialect, which is the foundation of the literary language, and White Russian, are both best classed with the a dialect.

The Moscow dialect really covers a very small area, not even the whole of the government of Moscow, but political causes have made it the language of the governing classes and hence of literature. It is a border dialect, having the southern pronunciation of unaccented o as a, but in the jo for accent e...
RUSSIAN LITERATURE

Before a hard consonant it is akin to the North and it has also kept the northern pronunciation of ґ instead of the southern ʰ. So far unaccented ґ sounds like ɨ or ɨ.

White Russian, in the governments of Vitsebsk, Mohilev and Minsk, and adjoining parts of Pskov, Smolensk, Chernigov and Vilna (some 10,000,000 speakers), appears at first so different from Great Russian that it was long classed as a separate division. It was the official language of the Lithuanian principality afterwards merged in Poland and hence was under strong Polish influence. Little R. was under somewhat similar influence, so that the two dialects have approximated in some respects; but originally White Russian was not much nearer Lit. R. than was any other south Gt. R. dialect. In its main characteristic Wh. R. approximates to Polish, but this likeness goes deeper than the surface Polonisms above referred to, as it falls into its natural place in the classification of Slavonic languages by the phenomena of "softening." Accordingly ɨ and ɨ, when soft or before soft ɨ, become ě and ě, e.g. R. "telo," "body," "d'leo," "deer," "bear," Wh. R. "telo," "dzielo," "m'edv'ed," Polish "cielo," "dzielo," "niezdzień." Other special points which distinguish Wh. R. from the other dialects are a tendency to confuse ɨ and ɨ and to pronounce either of them as ɨ, as in "Russian" chv and "chv"; also ɨ is always hard; ɨ, a sound essentially non-Slavonic, appears as ch or ch, e.g. "chronica," "francu," a Frenchman," tschodor, F. P.'dor, "Theodore.

In accidence we may note the preservation of the sibilants before case terminations where R. has restored gutturals by analogy, e.g. locatives naže, rucz, saže, R. nege, rük, seče, from nega, "foot," "ruk," "hand," "soča," "plough," and of the 3rd sing. pres. ind. in ě for ɨ, or without any ě. "V'ęd'ęt or v'ęš'ęt for R. "vedit," "leads." On the boundary between Wh. R. and the Novgorod dialect the former has the latter's confusion of ě and ě.

The best account of Wh. R. is E. Karski, Sketch of the Sounds and Forms of Wh. R. Speech (Moscow, 1886); there is a dictionary by Nosović (St. P., 1875). Bezsonov, Wh. R. Songs (Moscow, 1874), and P. V. Schein in a whole series of publications give good specimens of the dialect.

The Little Russian dialect claims to be a literary language; it has established this claim in Galicia (see Ruthenians), but its use as such is much restricted in Russia. The Little Russians differ considerably from their fellow tribes not only in language but in physical type, customs, domestic architecture and folk-lore; but though Russophobes have tried to prove that this is due to the Finnish element in the Great Russians, it cannot be substantiated, and the Little Russians, especially the descendents of the Cossacks, have no small Tatar element in them. For the last three centuries they have been under strong Polish influence, and this has had great effect upon the vocabulary but not much on phonetics or morphology. Little Russian is divided into three main groups of dialects: those of Hungary, which show an approximation to Slovak; those of Galicia, which rather recall Polish; and those of the Ukrain and other districts in Russia, which gradually shade into South Great Russian and White R., though the sound of the vowel ə is noticeably absent. Little Russian is rather characterized by itacism; for original ɨ and original ɨ have coincided in a sound between ɨ and ě not unlike the Eng. short ɨ, and original ɨ, also ɨ and even ə after having been lengthened in compensation for lost semi-voices are now represented by ě.

Further, Little Russian has reduced the common Russian softening, only keeping it before ɨ and ɨ and ɨ for ě and Ŋ, and hardening the consonant before ě and original ɨ. In common with Wh. R. it has ʰ for ɡ, a vocative case, which made sibilant before ɨ (for ɨ) in oblique cases, 3rd sing. without the ě, 1st plur. in -mo and -me instead of mi, ni for nj, lj for lj, lj f t fj, ɨ for u, and hard ě, but all these occur more or less throughout S. Russian and only tend to a superficial resemblance.

These phonetic peculiarities are not universal, but the presence of the narrowed ě, e and ɨ is sufficient to mark a dialect as Little Russian. The Russian alphabet is modified for Little Russian use as r = h and hence t = g; e is used for the ɵ which does not soften the preceding vowel, u for the thick and i for the pure į.

Russian Grammar: Th. Beck, Historical Grammar of the R. Language (Moscow, 1875); A. Sobolewskii, Lectures on the History of the R. Language (St. P., 1891); id., Attempt at R. Dialectology, pt. 1. (Gt. and Wh. R.) (St. P., 1897); W. R. Morilli, R. Grammar (Oxford, 1887); P. Morri, R. Conversation Grammar (London, 1862); C. R. Reiff, R. Grammar (London, 1885); O. Asbôt, Kurte R. Grammatik (Leipzig, 1900); R. Abich, Die Haspitschweilereien der R. Sprache (Leipzig, 1897); P. Boyer, M. Spersan and S. Harper, Russian Reader (Chicago, 1906).

Many accepted texts translated by R. Gerbold, Leipizg. Th. Bursaia, Historical R. Chrestomathy (Moscow, 1864), gives specimens of Russo-Slavonic, Old R. and Dialects. The chief periodicals containing scientific papers on the R. language are the Sbornik (Miscellany) and Fizika (Bulletin) of the Second Section of the St. P. Acad., and the Zapiski (Transactions) of the Philosophical Faculties of the Russian universities. Old Russian Texts are published mostly by the Oběčestvo L'ubitel'â Drevnej Pismennosti (Soc. of Lovers of Ancient Literature) in St. Petersburg.

RUSSIAN LITERATURE. To get a clear idea of Russian literature, it will be most convenient for us to divide it into oral and written. The first of these sections includes the interesting byliy, or "tales of old time," as the word may be translated, which have come down to us in great numbers, as they have been sung by wandering minstrels all over the country. The scholars who have given their attention to these compositions have made the following division of them into cycles: (1) that of the older heroes; (2) that of Vladimir, prince of Kiev; (3) that of Novgorod; (4) that of Moscow; (5) that of the Cossacks; (6) that of Peter the Great; (7) the modern period. These poems, if they may be so styled, are not in rhyme; the ear is satisfied with the rhythm, the words in imitation of speech. For a long time they were neglected, and the collection of them began only towards the conclusion of the 17th century. The style of Russian literature which prevailed from the time of Lomonosov was wholly based upon the French or pseudo-classical school. It was, therefore, hardly likely that these peasant songs would attract attention. But when the gospel of romanticism was preached and the History of Karamzin appeared, a new impulse was given to the collection of all the remains of popular literature. In 1804 appeared a volume based upon those which had been gathered together by Cyril or Kirsha Danilov, a Cossack, at the beginning of the 18th century. They were received with much enthusiasm, and a second edition was published in 1818. In the following year there appeared at Leipzig a translation of many of these pieces into German, in consequence of which they became known much more widely. This little book of 160 pages is important because the originals of some of the byliy translated in it are now lost. Since that time large collections of these poems have been published, edited by Rybnikov, Helifserding, Srezenitsky, Avenarius and others.

These curious productions have all the characteristics of popular poetry in the endless repetitions of certain conventional phrases—the "green wine," the "bright sun" (applied to a hero), "the damp earth" and others. The heroes of the first cycle are monstrous beings, and seem to be merely impersonifications of the powers of nature; such are Volga Vseslavich, Mikuł Szelajnowicz and Sviatigor. They are called the bogatyri starshine. Sometimes we have the giants of the mountain, as Sviatigor, and the serpent Gorinich, the root of part of both
RUSSIAN LITERATURE

915

names being gora (mountain). The serpent Gorinich lives in caves, and has the care of the precious metals. Sometimes animal natures are mixed up with them, as smol-bogaty, who unites the qualities of the serpent and the giant, and bears the name of Tugarin Zmiieviich. There is the Pagan Idol (Idolsiche pogonok), a great glutton, and Nightingale the Robber (Solevyi Razboinik), who terrifies travellers and lives in a nest built upon six oaks.

In the second cycle the legends group themselves round the celebrated Prince Vladimir of Kiev. The chief hero is Ilya Muromets, who performs prodigies of valour, and is of gigantic stature and superhuman strength. The cycle of Novgorod deals with the stories of Vasili Buslaevich and Sadko, the rich merchant. The fourth cycle deals with the autocracy; already Moscow has become the capital of the empire. We are told of the taking of Kazan, of the conquest of Siberia by Yermak, of Ivan the Terrible and his confident Malluta Skuratovitch. It is observable that in the popular tradition Ivan is not spoken of with any hatred. As early as 1610 some of these byliny were committed to writing by Richard James, an Oxford graduate who was in Russia as chaplain of the embassy. The most pathetic is that relating to the unfortunate Xenia, the daughter of Boris Godunov. Yermak, the conqueror of Siberia, forms the subject of a very spirited lay, and there is another on the death of Ivan the Terrible; in the relation in which she stood to the Russians, we cannot wonder that Maria, the wife of the false Demetrius, appears as a magician. Many spirited poems are consecrated to the achievements of Stenka Razin, the bold robber of the Volga, who was for a long time a popular hero. The cycle of Peter the Great is a very interesting one. We have songs in abundance on the achievements of the tsar, as the taking of Azov in 1666. There is also a poem on the execution of the sirdlity, and another on the death of Peter. In the more modern period there are many songs on Napoleon. The Cossack songs, written in the Little Russian language, dwell upon the glories of the sech, the sufferings of the people from the invasions of the Turks and Mongols, the exploits of the Haldamaks and, lastly, the fall of the Cossack republic. Besides these, the Russians can boast of large collections of religious poems, many of them containing very curious legends. In them we have a complete store of the beliefs of the Middle Ages. A rich field may be found here for the study of comparative mythology and folk-lore. Many of them are of considerable antiquity, and some seem to have been derived from the Midrash. Some of these monuments of Russian literature have been collected by Besy. Besides the byliny or legendary poems, the Russians have large collections of skazki or folk-tales, which have been gathered together by Sakharov, Afanasev and others. They also are full of valuable materials for the study of comparative mythology.

Leaving the popular and oral literature, we come to what has been committed to writing. The earliest specimen of Russian, properly so called, must be considered the Ostromir Codex, written by the diak Gregory at the order of Ostromir, the posadnik or governor of Novgorod. This is a Russian recension of the Slavonic Gospels, of the date 1056-57. Of the year 1073 we have the Izbornik or “Miscellany” of Sviatoslav. It was written by John the diak or deacon for that prince, and is a kind of Russian encyclopaedia, drawn from Greek sources. The date is 1076. The style is praised by Buslaev as clear and simple. The next monument of the language is the Discourse concerning the Old and New Testament, by Baliarion, metropolitan of Kiev. In this work there is a panegyric on Prince Vladimir of Kiev, the hero of so much of the Russian popular poetry. Other writers are Theodosius, a monk of the Pestchiksky cloister, who wrote on the Latin faith and Latin Orthodoxy, or Instructions,” and Luko Zhidita, bishop of Novgorod, who has left us a curious Discourse to the Brethren. From the writings of Theodosius we see that many pagan habits were still in vogue among the people. He finds fault with them for allowing these to continue, and also for their drunkenness; nor do the monks escape his censure.
RUSSIAN LITERATURE

916

anachronisms. The third is altogether poetical. The Povesti o Drakule ("Story of Drakule") is a collection of anecdotes relating to a cruel prince of Walachia who lived in the 15th century. (See RUMANIA, History.) Several of the barbarities described in it have also been assigned to Ivan the Terrible.

The early Russian laws present many features of interest, such as the Russkaya Pravda of Yaroslav, which is preserved in the chronicle of Novgorod; the date is between 1018 and 1054. The laws show Russia at that time to have been in civilization quite on a level with the rest of Europe. But the evil influence of the Mongols was soon to make itself felt. The next important code is the Sudebnik of Ivan III., the date of which is 1497; this was followed by that of Ivan IV. of the year 1550, in which we have a republication by the tsar of his grandfather's laws, with additions. In the time of this emperor also was issued the Slobog (1551), a body of ecclesiastical regulations. Mention must also be made of the Uloahenie or "Ordinance" of the tsar Alexis. This abounds with enactments of sanguinary punishment; women are buried alive for murdering their husbands; torture is recognized as a measure of proof; torture evidence; and the knout and mutilation are mentioned on almost every page. Some of the penalties are whimsical: for instance, the man who uses tobacco is to have his nose cut off; this was altered by Peter the Great, who himself practised the habit and encouraged it in others.

In 1553 a printing press was established at Moscow, and in 1564 the first book was printed, an "Apostol," as it is called, i.e. a book containing the Acts of the Apostles and the Epistles. The printers were Ivan Feodorov and Peter Timofiev; a monument has been erected to the memory of the former. As early as 1548 Ivan had invited printers to Russia, but they were detained on their journey. Feodorov and his companions were soon, however, compelled to leave Russia, and found a protector in Sigismund III. The cause appears to have been the enmity of the copyists of books, who succeeded in drawing over to their side the more fanatical priests. The first Slavonic Bible was printed at Ostrog in Volhynia in 1581. Another press, however, was soon established at Moscow; up to 1600 sixteen books had been issued there.

A curious work of the time of Ivan the Terrible is the Domostroy, or "Book of Household Management," which is said to have been written by the monk Sylvester. This priest was at one time very influential with Ivan, but ultimately was banished to the Solovetsky monastery on the White Sea. The work was originally intended by Sylvester for his son Anthimius and his daughter-in-law Pelagia, but it soon became very popular. We have a faithful picture of the Russia of the time, with all its barbarisms and ignorance. We see the unbounded authority of the husband in his own household: he may inflict personal chastisement upon his wife; and her chief duty lies in ministering to his wants. To the reign of Ivan the Terrible must also be assigned the Chasti-Minei or "Book of Monthly Readings," containing extracts from the Greek fathers, arranged for every day of the week. The work was compiled by the metropolitan Khall, and was the labour of two years. The best writer of the same period was Prince Andrew Kurbskiy, descended from the sovereigns of Yaroslavl, who was born about 1528. In his early days Kurbskiy saw a great deal of service, having fought at Kazan and in Livonia. But he quarrelled with Ivan, who had begun to persecute the followers of Sylvester and Adashev, and fled to Lithuania in 1563, where he was well received by Sigismund Augustus. From his retreat he commenced a correspondence with Ivan, in which he reproached him for his many cruelties. Ivan in his answer declared that he was quite justified in taking the lives of his slaves if he thought it right to do so. Kurbskiy died in exile in 1583. He also wrote a life of Ivan, but Bestuzhev Riumin thinks that his hatred of Ivan led him to exaggerate, and he regrets that Karamzin should have followed him so closely. Besides the answers of Ivan to Kurbskiy, there is his letter to Cosmas and the brotherhood of the Cyrilian monastery on the White Lake (Bielo Ozero), in which he reproaches them for the self-indulgent lives they are leading. Other works of the 16th century are the Steppenmoya Kniga, or "Book of Degrees" (or "Pedigrees"), in which historical events are grouped under the reigns of the grand-dukes, whose pedigrees are also given; and the Life of the Tsar Feodor Ivanovich (1584—98), written by the patriarch Job.

To the beginning of the 17th century belongs the Chronograph of Sergius Kubasov of Tobolsk. His work extends from the creation of the world to the accession of Michael Romanov, and contains interesting accounts of such of the members of the Russian royal family as Kubasov had himself seen. Something of the same kind must have been the journal of Prince Matsislavsky, which he showed the English ambassador Jerome Horsey, but which is now lost.

To the time of the first Romanovs belongs the story of the siege of Azov, a prose poem, which tells us, in an inflated style, how in 1637 a body of Cossacks triumphantly repelled the attacks of the Turks. There is also an account of the siege of Baku, written by the metropolitan of Vremya, or Period of Troubles, as it is called—what deals with the adventures of the false Demetrius and the Polish invasion which followed. But all these are surpassed by the work on Russia of Gregory Karpov Kotsoshkin. He served in the ambassador's office (posolsky prikaz), and when called upon to give information against his colleagues he fled to Poland about 1664. Thence he passed into Sweden and wrote his account of Russia under Alexis Mikhailovich at the request of Count Delagardie, the chancellor. He was executed in 1667 for slaying in a quarrel the master of the house in which he lived. The manuscript was found by Professor Soloviev of Helsingfors at Upsala and printed in 1840. The picture which Kotsoshkin draws of his native country is a sad one, and from his description, and the facts we gather from the Domostroy, we can reconstruct the Old Russia of the time before Peter the Great. Perhaps, as an exile, Kotsoshkin allowed himself to write a little too bitterly. A curious work is the Uriadniki Sobolishchiy Puti ("Directions for Falconry"), which was written for the use of the emperor Alexis, who, like many Russians of old time, was much addicted to this pastime. The Serb, Yuri Krzhahkanich, who wrote in Russian, was the first pan-Slavist, anticipating Kollor by one hundred and fifty years or more. He wrote a critical Servian grammar (with comparison of the Russian, Polish, Croatian and White Russian), which was edited from the manuscripts by Bodianski in 1848. For his time he had a very good insight into Slavonic philology. His pan-Slavism, however, sometimes took a form by no means practical. He went so far as to maintain that a common Slavonic language might be made for all the peoples of that race—an impossible project which has been the dream of many enthusiasts. He was banished to Siberia, and finished his grammar at Tobolsk. He also wrote a work on the Russian empire in the middle of the 17th century, completed in 1676, which was edited by Beszonov in 1866. The picture drawn, as in the corresponding production of Kotsoshkin, is a very gloomy one. To this period belongs the life of the Tsarevich Vasilii by Shatrov. His struggles with Niph, with the tsar, and his emendations of the sacred books, which led to a great schism in Russia, are well known. They have been made familiar to Englishmen by the eloquent pages of the late Dean Stanley. From this revision may be dated the rise of the Raskolniki (Dissenters) or Staro-obiadisti (those who adhere to the old ritual). With Simeon Polotski (Polotskiy) (1628—1680) the old period of Russian

1 Horsey says: "I read in their chronicles written and kept in secret by a great priest prince of that country named Knez Ivan Fedorovich Mstislofskoi, who, out of his love and favour, imparted unto me many secrets observed in the memory of his time, which was fourscore years, of the state, natur, and government of that commonwealth."—Bond, Russia at the Close of the Sixteenth Century (Hakluyt Society, 1856).

2 Lectures on the Eastern Church.
RUSSIAN LITERATURE

literature may be closed. He was tutor to the tsar Fedor, son of Alexis, and may be said to have helped to introduce the culture of the West into Russia, as he was educated at Kieff, then a portion of Polish territory. Polotski came to Moscow about 1664. He wrote religious works (\textit{Vieins Viyri, \"The Garland of Faith\"}), and composed poems and religious dramas (\textit{The Prodigal Son, Neubahazheezar, \&c.}). He has left us some droll verses on the tsar's new palace of Kolomensko, which are very curious doggerel. The artificial lions that roared, moved their eyes, and walked especially delighted him. There does not seem to be any ground for the assertion (often met with even in Russian writers) that Sophia, the sister of Peter the Great, was acquainted with French, and translated some of the plays of Molière.

And now all things were to be changed. Russia was to adopt the forms of literature in use in the West. One of the chief helpers of Peter the Great in the education of the people was Feofane (Theophanes) Procopovitch (1681-1736), author of the Ecclesiastical Regulations and some plays, who advocated the cause of science; the old school, led by Fedor Trediakovski (1658-1722), whose \textit{Rock of Faith} was written to reflect the Lutheran dogmas.

Another remarkable writer of the times of Peter the Great was Pososhkov (b. 1673), a peasant by birth, who produced a valuable work on \textit{Poverty and Riches}. Antioh Kanterim (1708-1744), son of a former hospodar of Moldavia, went to a Jesuit school and later became a Jesuit. He was for some time Russian ambassador to the courts of London and Paris. But more celebrated than these men was Michael Lomonosov (g.v.). He was an indefatigable writer of verse and prose, and has left odes, tragedies, didactic poetry, essays and fragments of epic.

Vassili Tatishchev (1686-1750) was the author of a Russian history which is interesting as the first attempt in that field. He was dis-\c{c}graded for peccadillo and banished to Astrakhan as governor, in 1750. His work was not given to the world till after his death. There had been a slight sketch published before by Khilkov, entitled the \textit{Marrov of Russian History}. Basil Trediakovski (1703-1766) was born at Astrakhan, and we are told that Peter, passing through that city at the time of his Persian expedition, had Trediakovski pointed out to him as one of the most promising boys of the school there. Wherupon, having questioned him, the tsar said that he had poetic instincts. Trediakovski replied, 'Poet's business is nothing.' His \textit{Telemakha}, a poem in which he versified the \textit{Télémaque} of Fénelon, drew upon him the derision of the wits of the time. He had frequently to endure the rough horse-play of the courtiers. He was possessed of a literary man at that time in Russia was not altogether a cheerful one. His services, however, to the Russian language were great.

From the commencement of the reign of Elizabeth Russian literature found new materials, both from the West and from home. Alexander Sumarokov (1718-1777), a man of purse and polish, became, in abundance—comedies, tragedies, idyls, satires and epigrams. He is, perhaps, best entitled to remembrance for his play \textit{The Drowned Man}, and, in the French style. His \textit{Dmitri Samosvetov} (\textit{\"Demonstrations in Poetry\"}) is certainly not without merit. Some of the pieces of Kniazhnia had great success in their time, such as \textit{The Chatterbox, The Originals} and especially \textit{The Fatal Carriage}. He is now almost forgotten, but in numerous editions. In 1777 he was made a Count of Petersburg, the director being Sumarokov. Up to this time the Russians had only acted religious plays, such as those written by Simeon Polotski. The reign of Catherine II. (1729-96) herself a voluminous writer, was a period of more than twelve years. Everything in Russia was to be forced like plants in a hot-house; she was to have Homers, Pindars, Horaces and Virgils. Michael Kheraskov (1733-1807) wrote besides other poems two eminently valuable epics, \textit{Vladimir} in eighteen; they are now but little read. Hippolit Bogdanovich (1743-1803) wrote a pretty lyric piece, \textit{Dushenka}, based upon La Fontaine, and telling the old story of the boy and Cupid. With Ivan Khenmitzher begins the list of fabulists; this half-oriental form of literature, so common in countries ruled absolutely, has been very popular in Russia. Khenmitzher (1744-1808), whose name seems to imply a German origin, began by translating the fables of Gellert, but afterwards produced original

specimens. A writer of real national comedy appeared in Denis von Visin, probably of German extraction, but born at Moscow (1744-1792). His best production is \textit{Nedorol} (\textit{\"The Minor\"}), in which he satirizes the coarse features of Russian society, and the ill-treatment of the serfs, and other matters. He saw France on the eve of the great revolution, and must have thrilled with what he did see. Russian as he was, and accustomed to servility, he was yet astonished at the wretched condition of the French peasants. The great poet of the age of Catherine, the laureate of that court, was Gavriil Derzhavin (1749-1816). He essayed many styles of composition, and was a great master of his native language. There is something grandiose and organ-like in his high-sounding verses; unfortunately, he thought too highly of his own work. He is not perfect; and he had the courage to write satirically of many persons of high rank. His \textit{Ode to God} is the best known of his poems in Western countries. He was a student of Ossian, and of Edward Young (1700-1786).

His \textit{Memoirs of the Life of Pushkin} have been published in 1857. An enthusiastic adherent of thecause of Catherine was Alexander Radichtchev (1749-1802), who, having, in a small work, \textit{A Journey to St Petersburg and Moscow}, spoken too severely of the miserable condition of the serfs, was punished by banishment. A still more remarkable, however, was the celebrated \textit{Archbishop Platon (g.v.)}. Ivan Dmitriev (1769-1837) wrote some pleasing lyrics and epistles, of much more than passing worth. His \textit{Discourse on the Art of Literature} to have been well acquainted with the English poets.

But a better state of things came with the reign of Alexander, one of the glories of whose days was Nicholai Karamzin (g.v.). His chief work is his \textit{History of the Russian Empire}, but he is best known in the four volumes of \textit{Memoirs of the Knight of Castle-Tale, so Vasili Zhukovskiy (1753-1852) may be said to have been that of the age of Alexander. His \textit{Memoirs} are more remarkable, however, as a translator than as an original poet. With him Romanticism began in Russia. He became the first to impress and afterwards tutor to his children. In 1802 he published a work \textit{The Inhabitants of a River Valley}, which once became a highly popular poem in Russia. Zhukovskiy translated many pieces from the German (Goethe, Schiller, Uhland) and English (Byron, Moore, Southey). One of his original productions, \textit{The Lament of Pimen}, was based on the epic of \textit{The Lay of the White Night}. It was on the lips of every one at the time of the War of the Fatherland (\textit{Otechestvennaia Voia}) in 1812. He produced versions of the episode of Nala and Davayanti from the \textit{Mahabhara}, of Rustum and \textit{Shah Nermag}, and of a part of the \textit{Odyssey}. In the case of these three masterpieces, however, he was obliged to work from literal translations (mostly German), as he was unacquainted with the original languages. The \textit{Iliad} was translated during this period, but \textit{The Odyssey} was not attempted until after his death. His version of his career promised much, but sank into obscurity, and lived in this condition to an advanced age. Melzliakov and \textit{Zalganov} deserve a passing notice as the writers of songs some of which achieved great popularity. During his short life (1795-1837) Alexander Pushkin (g.v.) was prodigiously and much translated. He is best known by the \textit{Poems on Various Subjects, Ancient and Modern}, which will be found enumerated in the article devoted to him (see \textit{Pushkin}). In Alexander Griboyedov (1795-1829) (g.v.) the Russians saw the writer of one of their best works, \textit{The Wandering Emperor}. Later came \textit{Gonorrheal Love}, which was translated \textit{\textit{The Misfortune of Being Too Clever}} (lit. \textit{\textit{Grief out of Wit}}). Ivan Kozlov (1774-1838) was author of some pretty original lyrics, and some translations from the English, among others Burns's \textit{Auld Lang Syne}. He became a cripple and blind, and his misfortunes elicited some cheering and sympathetic lines from Pushkin, which will always be read with pleasure.

Pushkin found a successor in Michael Lermontov (g.v.), who...
has left us many exquisite lyrics. A genuine bard of the people, and one of their most truly national authors, was Alexis Koltsov (1809–1832), the son of a tallow merchant of Voronezh. He has left us a few exquisite lyrics, which are among the best in all Russian literature. He died of consumption after a protracted illness. Another poet who much resembled Koltsov was Ivan Nikitin (1826–1861), born in the same town, Voronezh. His best work was, like Koltsov’s, in a codex circulated among the Russian intelligentsia to keep an inn; this he was afterwards enabled to change for the more congenial occupation of a bookseller. The novel in Russia has had its cultivators in Zakasin and Lazhechnikov, who imitated its scenery and the habits of the people, especially in such stories as the Old-Fashioned Household, or in the more powerful Taras Bulba. This last is a highly wrought story, giving us a picture of the Cossack life of the late 17th century. The novel was under a ban on Russia, and Zakasin was also the author of a good comedy, The Revisor, wherein the petty pirlings of Russian municipal authorities are satirized. In his Memoirs of a Madman and Portrait, he shows us a weird and fantastical world of dreams, but there is little to suggest the great imagination. The same may be said of The Clock, and the curious tale Viz (“The Demon”), where he gives us a picture of Kiev in the old days.

The first Russian novelist of great and original talent was Nicholai Gogol (1809–1852) (q.v.). In his Dead Souls he satirized all classes of society, some of the portraits being wonderfully true to life. His novel of the same title, The Overcoat, has been translated into many languages. found in continual warfare with the Polish pan and the attempts of the Jesuits to introduce the Roman Catholic religion; (3) the period of the Haidamaks, who formed the nucleus of the national party, and prolonged the struggle.

The period of Russian literature (written, as opposed to the oral) was laid by Ivan Kotliarevskiy (1790-1838), whose masterpiece of the Aeneid enjoys great popularity among some of his countrymen. Others, however, object to it as tending to stifle the Russian genius. The Patriotic poet appeared in Taras Shevchenko, born at the village of Kirilovka, in the government of Kiev, in the condition of a serf. The strange adventures of his early life he has told us in his autobiography, The Cossack. At the age of 23, he exchanged the drudgery of his education for the freedom of the Cossack, and at the age of 42, he was punished with exile to Siberia from 1847 to 1857. He did not recover his return, dying in 1861, aged forty-six. He had no history to which he described with greater vigour than Shevchenko the old days of the Ukraine. In his youth he listened to the village traditions and with faithfulness reproduced them in his poems. In the powerful poem entitled Haidamak we have a graphic picture of the heroic deeds of the tsars and their followers at the battle of Uman. The funeral of the poet was a vast public procession; a great crowd gathered to see him die. He was buried near Kanion on the banks of the Dnieper. His grave has been called the "Mecca of the Russian Revolutionists." A complete edition of his works, with interesting biographical sketch, was published by the Petersburg Government of Sciences in Prague in 1876. Besides the national songs, excellent collections of the South Russian folk-tales have been published, edited by Dragomarov, Rudchenko, and others. Many of these are still recited by the folk and the works of such masters of the national Russian dialects as Yurij Zaspitskiy u uchyot Rossi ("Papers on Southern Russia"), published at St Petersburg in 1857 by Panteleimon Kulish. After he got into trouble (with Kostomarov and Shevchenko) for his political views, he was imprisoned in various places; but his mind was not a school of historians is thus almost extinct. But some excellent writers in this department have come to the front. Professor Milutinov has started his sketches of the History of the Russian School, which has been received with much enthusiasm. His work is accompanied by a valuable collection of documents. Professor Bilbao's History of the Kievan Principality, one of his most valuable contributions, is accompanied by a careful study of the Rostov-Kiev story. The work of Professor P. T. Rozhkov has been received with much enthusiasm. His History of the Northern and Western Stories in the Sixteenth and Seventeenth Centuries was published in 1883 a valuable work. It was received with much enthusiasm. His History of the Northern and Western Stories in the Sixteenth and Seventeenth Centuries was published in 1883 a valuable work. were discussed in vain between August 1903 and February 1904, and finally negotiations were broken off on February 5th. Japan had already on the 4th decided to use force, and her military and naval preparations, unlike those of Russia, kept pace with her diplomacy.

This was in fact an eventuality which had been foreseen and on which the naval and military policy of Japan had been based for ten years. She too had her projects of expansion and hegemony, and by the Chino-Japanese War she had gained a start over her rival. The reply of the Western powers was first to compel the victor to maintain the territorial integrity of China, and then within two years to establish themselves in Chinese harbours. From that moment Japanese policy was directed towards establishing her own hegemony and meeting the advance of Russia with a fact accompli. But her armaments were not then adequate to give effect to a strong-handed policy, so that for some years thereafter the government had both to impose heavy burdens on the people and to pursue a foreign policy of marking time, and endured the fiercest criticism on both counts, for the idea of war with Russia was as popular as the taxes necessary to that object were detested. But as the army and the navy increased year by year, the tone of Japanese policy became firmer. In 1902 her position was strengthened by the alliance with England; in 1903 her army, though in the event it proved almost too small, was considered by the military authorities as sufficiently numerous and well prepared, and the arguments of the Japanese diplomats stiffened with menaces. Russia, on the other hand, was divided in policy and consequently in military intentions and preparations. In some quarters the force of the new Japanese army was well understood, and the estimates of the balance of military power formed by the minister of war, Kuropatkin, coincided so remarkably with the facts that at the end of the summer of 1903 he saw that the moment had come when the preponderance was on the side of the Japanese. He therefore proposed to abandon Russian projects in southern Manchuria and the Port Arthur region and to restore Port Arthur to China in return for considerable concessions on the side of Vladivostok. His plan was accepted, but a lateral influence suddenly made itself felt, and the completely unexpected result was war. Large commercial interests were in fact involved in the forward policy, “the period of heavy capital expenditure was over, that of profits about to commence,” and the power and intentions of Japan were ignored or misunderstood. Further, Dragomirov, a higher military authority even than Kuropatkin, declared that “Far Eastern affairs were decided in Europe.” Thus Russia entered upon the war both unprepared in a military sense, and almost entirely indifferent to its causes and its objects. To the guards and patrols of the Manchurian railway and the garrisons of Port Arthur and Vladivostok, 80,000 in all, Japan could, in consequence of her recruiting law of 1896, oppose a first-line army of some 270,000 trained men. Behind these, however, there were scarcely 200,000 trained men of the older classes, and at the other end of the long Trans-Siberian railway Russia had almost limitless resources. The strategic problem for Japan was, how to strike a blow sufficiently decisive to secure her object, before the at present insignificant forces of the East Siberian army were ready for action at the point of being employed. It turned therefore, principally upon the efficiency of the Trans-Siberian railway and in calculating this the Japanese made a serious underestimate. In consequence, far from applying the “universal service” principle to its full extent, they trained only one-fifth of the annual contingent of men found fit for service. The quality of the army, thus composed of picked men (a point which is often forgotten), approximated to that of a professional force; but this policy had the result that, as there was no adequate second-line army, parts of the first-line had to be reserved, instead of being employed at the front. And when for want of these active troops the first great victory proved indecisive, half-trained elements had to be sent to the front in considerable numbers—indeed the ration strength of the army was actually trebled. The aim of the war “limited” in so far that the Japanese never deluded themselves with dreams of attacking Russia at home, was to win such victories as would establish the integrity of Japan herself and place her hegemony in the Far East beyond challenge. Now the integrity of Japan was worth little if the Russians could hope ultimately to invade her in superior force, and as Port Arthur was the station of the fleet that might convey an invasion, as well as the symbol of the longed-for hegemony, the fortress was necessarily the army’s first objective, a convincing Sedan was the next. For the navy, which had materially only a narrow margin of superiority over the Russian Pacific Squadron, the object was to keep the two halves of that squadron, at Port Arthur and Vladivostok respectively, separate and to destroy them in detail. But in February weather these objects could not be pursued simultaneously. Prior to the break-up of the ice, the army could only disembark at Chemulpo, far from the objective, or at Dalny under the very eyes of its defenders. The army could therefore, for the moment, only occupy the Korea and try to draw upon itself hostilities that would otherwise be available to assist Port Arthur when the land attack opened. For the navy, instant action was imperative.

On the 8th of February the main battle-fleet, commanded by Vice-Admiral Togo, was on the way to Port Arthur. During the night his torpedo-boats surprised the Russian squadron in harbour and inflicted serious losses, and later in the day the battleships engaged the coast batteries. Repulsed in this attempt, the Japanese established a stringent blockade, which tried the endurance of the ships and the men to the utmost. From time to time the torpedo-craft tried to run in past the batteries, several attempts were made to block the harbour entrance by sinking vessels in the fairway, and free and deadly use was made by both sides of submarine mines. But, though not destroyed, the Port Arthur squadron was paralysed by the instantaneous assertion of naval superiority.

Admiral Alekseyev, the tsar’s viceroy in the Far East and the evil genius of the war, was at Port Arthur and forbade the navy to take the risks of proceeding to sea. For a time, when in place of Admiral Starck (who was held responsible for the surprise of February), Admiral Makarov, an officer of European reputation, commanded the fleet, this lethargy was shaken off. The new commander took his ships to sea every day. But his energetic leadership was soon ended by a tragedy. A field of electro-mechanical mines was laid by the Japanese in the night of April 12th–13th, and on the following day the Japanese cruisers stood inshore to tempt the enemy on to the mine-field. Makarov, however, crossed it without accident, and pursued the cruisers until Togo’s battle-fleet appeared, whereupon he went about and steamed for port. In doing so he recrossed the mine-field, and this time the mines were effectual. The flagship “Petropavlovsk” was struck and went down with the admiral and 600 men, and another battleship was seriously injured. Then the advocates of the “limited” war turned down the upper hand and kept the squadron in harbour, and henceforward for many months the Japanese navy lay unchallenged off Port Arthur, engaging in minor operations, covering the transport of troops to the mainland, and watching for the moment when the advance of the army should force the Russian fleet to come out. Meantime seven Japanese cruisers under Vice-Admiral Kaimamura went in search of the Russian Vladivostok squadron; this, however, evaded them for some months, and inflicted some damage on the Japanese mercantile marine and transports. The Japanese had not waited to gain command of the sea before beginning the sea transport of that part of their troops allotted to Korea. The roads of that country were so poor that the landing had to be executed by rail, and it was difficult to get the troops to the ports. The Japanese had not wasted their railway resources, and at the end of May 7,000 troops were landed at Vladivostok; further landings came to 70,000 men at Port Arthur, and in July 100,000 were landed at Dairen. The Japanese had occupied the whole of Manchuria, and the aim of the war was practically reached.
to be made, not on the Straits of Tsushima, but as far north as possible. Chemulpo, nearer by 50 m. to Port Arthur than to Japan, was selected. On the first day of hostilities Rear-Admiral Urui disembarked troops at Chemulpo under the eyes of the Russian cruiser "Variag," and next day he attacked and destroyed the "Variag" and some smaller war-vessels in the harbour, and the rest of the 1st Army (General Kuroki) was gradually brought over during February and March, in spite of an unbeaten and, under Makárov's régime, an enterprising hostile navy. But owing to the thaw and the subsequent break-up of the miserable Korean roads, six weeks passed before the columns of the army (Guard, 2nd and 12th divisions), strung out along the "Mandarin road" to a total depth of six days' march, closed upon the head at Wiju, the frontier town on the Yalu. Opposite to them they found a large Russian force of all arms.

The Russian commanders, at this stage at least, had not and could not have any definite objective. Both by sea and by land their policy was to mass their resources, repulsing meantime the attacks of the Japanese with as much damage to the enemy and as little to themselves as possible. Their strategy was to gain time without immobilizing themselves so far that the Japanese could impose a decisive action at the moment that suited them best. Both by sea and by land, such strategy was an exceedingly difficult game to play. But afoot, had Makárov survived, it would have been played to the end, and Togo's fleet would have been steadily used up. One day, indeed (May 15th), two of Japan's largest battleships, the "Hatsume" and the "Yashima," came in contact with free mines and were sunk. One of them went to the bottom with five hundred souls. But the admiral was not on board. The Russian sailors said, when Makárov's fate was made known, "It is not the loss of a battlefield. The Japanese are welcome to two of them. It is he." Not only the skill, but the force of character required for playing with fire, was wanting to Makárov's successors.

It was much the same on land. Kuropatkin, who had taken command of the army, saw from the first that he would have to gain three months, and disposed his forces as they came on the scene, unit by unit, in perfect accord with the necessities of the case. His expressed intention was to fight no battle until superiority in numbers was on his side. He could have gained his respite by concentrating at Harbin or even at Mukden or at Liao-Yang. But he had to reckon with the fleet at Port Arthur. He knew that the defences of that place were defective, and that if the fleet were destroyed whilst that of Togo kept the sea, there would be no Russian offensive. He therefore chose Liao-Yang as the point of concentration, and having thus to gain time by force instead of by distance, he pushed out a strong covering detachment towards the Yalu.

But little by little he succumbed to his milieu, the atmosphere of false confidence and passivity created around him by Alexieff. After he had minutely examined the whole question as to the strategy of the war, he would stress some new combinations, so that each fraction of it could contribute a little to the game of delaying the enemy before retiring on the positions next in rear, the commander of the detachment, Zasulich, told him that "it was not the custom of a knight of the order of St George to retreat," and Kuropatkin did not use his authority to recall the general, who, whether competent or not, obviously misunderstood his mission. Thus, whilst the detachment was still disposed as a series of rearguards, the foremost fractions of it stood to fight on the Yalu, against odds of four to one.

The Japanese 1st Army was carefully concealed about Wiju until it was ready to strike. Determined that in this first battle against a white nation they would show their mettle, the Japanese lavished both time and forethought on the minutest preparations. Forethought was still busy when, in accordance with instructions from Tokio, Kuroki on the 30th of April ordered the attack to begin at daybreak on the 1st of May. For several miles above Antung the rivers Yalu and Allo are parallel and connected by numerous channels. The majority of the islands thus formed were held and had been bridged by the Japanese. The points of passage were commanded by high ground a little farther up where the valleys definitely diverge, and beyond the flank of the ill-concealed positions of the defence. The first task of the right division (12th) was to cross the upper Yalu and seize this. To the Guard and 2nd divisions was assigned the frontal attack on the Chuliencheng position, where the Russians had about one-half of their forces under Major-General Kashtalinski. On the 30th of April, Inouye's 12th division accomplished its task of clearing the high ground up to the Allo. The Russians, though well aware that the force in their front was an army, neither retired nor concentrated. Zasulich's medieval generalship had been modified so far that he intended to retreat when he had taught the Japanese a lesson, and therefore Kuropatkin's original arrangements were not sensibly modified. So it came about that the combined attack of the Guard and Guard divisions against the front, and Inouye on the left flank and rear, found Kashtalinski without support. After a rather ineffective artillery bombardment the Japanese advanced in full force, without hesitation or finesse, and plunging into the river, stormed forward under a heavy fire. A few moments afterwards Zasulich ordered the retreat. But the pressure was far too close now. Broken up by superior numbers the Russian line parted into groups, each of which, after resisting bravely for a time, was driven back. Then the frontal attack stopped and both divisions abandoned themselves to the intoxication of victory. Meanwhile, the right attack (12th division) encountering no very serious resistance, crossed the Allo and began to move on the left rear of the Russians. On the side of the defence, each colonel had been left to retire as best he could, and thus certain fractions of the retreating Russians encountered Inouye's advancing troops and were destroyed after a most gallant resistance. The rearguard itself, at Hamatan, was almost entirely sacrificed, owing to the wrong direction taken in retreating by its left flankward. Fresh attempts were made by the subordinates to form rearguards, but Zasulich made no stand even at Feng-hwang-cheng, and the Japanese occupied that town unopposed on the 4th of May. The Japanese losses were 11000 out of over 40,000 present, the Russian (chiefly in the retreat) at least 2500 out of some 7000 engaged.

The Yalu, like Valmy, was a moment in the world's history. It mattered little that the Russians had escaped or that they had been in inferior numbers. The serious fact was that they had been beaten.

The general distribution of the Russian forces was now as follows: The main army under Kuropatkin was forming, by successive brigades, in two groups—I. Siberian Corps (Stakelberg), Niu-chwang and Kaiping; II. Siberian Corps, Liao-Yang, Zasulich (III. Corps and various other units) had still 27,000. In the Port Arthur "fortified rayon," under Lieut.-General Stoessel (IV. Corps), there were 27,000 men, and General Linievich around Vladivostok had 25,000. These are, however, paper strengths only, and the actual number for duty cannot have been higher than 110,000 in all. The Trans-Siberian railway was the only line of communication with Europe and western Siberia, and its calculated output of men was 40,000 a month in the summer. In October 1904, therefore, supposing the Japanese to have used part of their forces against Port Arthur, and setting this off against the absence of Linievich and Stoessel, Kuropatkin could expect to have a sufficient superiority in numbers to take the offensive. His policy was still, "No battle before we are in superior force."

For the moment it was equally Japan's interest to mark time in Manchuria. Still intent upon the Russian Port Arthur squadron, she had embarked her 2nd Army (General Oku, 1st, 3rd, 4th and 5th divisions) during April, and sent it to Chinhampo whence, as soon as the ice melted and Kuroki's victory cleared the air, it sailed to selected landing-place near Pitsewö. Here, under the protection of a continuous chain of war-vessels between the Elliot
Islands and the mainland, Oku began to disembark on the 5th of May. But the difficulties of the coast were such that it took three weeks to disembark the whole and to extend across the peninsula to Port Adams. Oku then, leaving the 5th division behind, moved down with the rest towards Kinchow, and after storming that place found himself face to face with a position of enormous strength, Nanshan Hill, at the narrowest part of the peninsula, where part of a Russian division (3000 only out of 12,000 were actually engaged) had fortified itself with extreme care. On the 26th of May took place the battle of Nanshan. The Japanese attack was convergent, but there was no room for envelopment; the Russian position moreover was "all-round" and presented no flanks, and except for the enfilade fire of the Japanese and Russian gunboats in the shallow bays on either side the battle was locally at every point a frontal attack and defence. The first rush of the assailants carried them up to the wire and other obstacles, but they were for many hours unable to advance a step farther. But the resolute Oku attacked time after time, and at last the 4th division on his right, assisted by its gunboats, forced its way into the Russian position. The Russians had just begun to retreat, in accordance with orders from higher authorities. But it was a second undeniable victory. It was, moreover, a preface to those furious assaults on Port Arthur which, because they were the expression of a need that every soldier felt, and not merely of a tactical method, transcend all cool-blooded criticism. The Japanese losses were 4700 out of 30,000 engaged or 15%, that of the Russians fully half of the 3000 engaged. The victors captured many guns, but were too exhausted to pursue the Russians, whose retirement was not made in the best order.

The transports were now conveying the 6th and 11th divisions to Pitszewo; these were to form the 3rd Army (Nogi) for operations against Port Arthur. Oku exchanged his 1st division for the 6th. The 2nd Army then turned northward (3rd, 4th, 5th and 6th divisions). The 10th division, forming the nucleus of the 4th Army, had begun to land at Takushan on the 19th of May. The 2nd and 4th Armies were the left wing of a widespread converging movement on Liao-Yang. Oku had the greatest
distance to march, Kuroki the smallest. The latter therefore had to stand fast in the face of the Russian Eastern Detachment, which threatened Kuroki’s march at most from Feng-hwang-cheng and could be supported in three more days by Kuropatkin’s main body, whereas the pressure of Oku’s advance would not begin to be felt by the Russian Southern Detachment until the twelfth day at earliest. It was necessary therefore for the first object to make a slight concession to the second. Oku had to start at the earliest possible moment, even though operations against Port Arthur were thereby delayed for a week or two. In fact, Oku’s march began on June 13th, Kuropatkin’s on June 24th; the moves of the intermediate forces at various dates within this time.

Meanwhile Kuropatkin, assembling the main army week by week, was in a difficult position. His policy of gaining time had received a severe blow in the failure of his executive officer to realize it, and that officer, though his unsupervised troops quickly regained their moral, had himself completely lost confidence. On the news of the battle (coupled with that of a fresh army appearing on the Korean coast) Kuropatkin instantly sent off part of his two central divisions (over the mountain passes of Fenshuiling and Motienling) against the imagined relentless pursuit of the victors, and prepared to shift his centre of concentration back to Mukden. The subsidiary protective forces on either flank of Zasulich had promptly abandoned their look-out positions and fallen back to join him. But the commander-in-chief, soon realizing that the Japanese were not pursuing, reasserted himself, sent the protective troops back to their posts, and cancelled all orders for the evacuation of Liao-Yang. From this time forward, Kuropatkin allowed his subordinates little or no initiative. A few days later, Zasulich’s persistent requests to be allowed to retreat and the still uncertain movements of the 2nd Army induced him once more to prepare a concentration on Mukden. But on the 6th of May he learned that the Japanese 1st Army had again halted at Feng-hwang-cheng and that the 2nd Army was disembarking at Pitszewo, and he resumed (though less confidently) his original idea. The Eastern protective detachment, now strengthened and placed under the orders of Count Keller, was disposed with a view to countering any advance on Liao-Yang from the east by a combination of manoeuvre and fighting.

It was at this moment of doubt that Alexiev, leaving Port Arthur just in time and profoundly impressed with the precarious state of affairs in the fleet and the fortress, gave the order, as commander-in-chief by land and sea, for an “active” policy (19th May). Kuropatkin, thus required to abandon his own plan, had only to choose between attacking the 1st Army and turning upon Oku. He did not yield at once; a second letter from the viceroy, the news of Nanshan, and above all a signed order from the tsar himself, “Inform General Kuropatkin that I impose upon him all the responsibility for the fate of Port Arthur,” were needed to bring him definitely to execute a scheme which in his heart he knew to be perilous. The path of duty for a general saddled with a plan which he disliked was either to abandon it or to carry it out. Kuropatkin, having received the order, refused, at the risk of enforced resignation, but so did Moreau; the generality of lesser men have obeyed, but so did Suvárov.

Stakelberg’s I. Siberian Corps was therefore reinforced towards the end of May up to a strength of above 35,000. But it remained a detachment only. The Liao-Yang central mass was still held in hand, for the landing of the 4th Army—really only a division at present—at Takushan and the wrong placing of another Japanese division supposed to be with Kuroki (really intended for Nogi) had aroused Kuropatkin’s fears for the holding capacity of Keller’s detachment. Moreover, disregarding the whole enterprise, he was most unwilling to use up his army in it. The Russians, then, at the beginning of June, were divided into three groups, the Southern, or offensive group (35,000), in the triangle Neuchwang-Haicheng-Kaiping; the Eastern or defensive group (30,000), the main body of it guarding the passes right and left of the Wiju-Liao-Yang road, the left (Cossacks) in the roadless hills of the upper Aio and Yalu valleys, the right (Mishchenko’s Cossacks and infantry supports) guarding Fenshuiling pass and the road from Takushan; the reserve (42,000) with Kuropatkin at Liao-Yang; the “Essuri Army”; about Vladivostok; and Stessel’s two divisions in the Kwantung peninsula.

On the other side the 1st Army was at Feng-hwang-cheng with one brigade detached on the roads on either hand, the left being reinforced in front of the Takushan division and facing the Fenshuiling. Oku’s 2nd Army (4 divisions or 60,000 combatants) was about Port Adams. This last was the objective of the attack of Stakelberg’s 35,000. Kuropatkin’s orders to his subordinate were a compromise between his own plan and Alexiev’s. Stakelberg was to crush by a rapid and energetic advance the covering forces of the enemy met with, and his object was “the capture of the Nanshan position and thereafter an advance on Port Arthur.” Yet another object was given him, to “relieve the pressure on Port Arthur by drawing upon himself the bulk of the enemy’s forces,” and he was not to allow himself to be drawn into a decisive action against superior numbers. Lastly, on June 7th, while Stakelberg was proceeding southward on his ill-defined errand, Kuropatkin, imposed upon by the advance of the Takushan column to Siu-yen, forbade him to concentrate to the front, only removing the veto when he learned that the 4th Army had halted and entrenched at Siu-yen.

On the 14th, all his arrangements for supply and transport being at last complete, Oku moved north. Although he was still short of part of the 6th division, he was in superior force. He had, moreover, the perfectly definite purpose of fighting his way north, and at Telissu or Wafangkou on the 14th of June, as he expected, he came upon Stakelberg’s detachment in an entrenched position. On the 14th and 15th, attacking sharply on the Russian front and lapping round both its flanks, Oku won an important and handsome victory, at a cost of 1200 men out of 35,000 engaged, while the Russians, with a loss of at least 3600 out of about 25,000 engaged, retired in disorder. Thus swiftly and disastrously ended the southern expedition.

Meantime, except for the movement on Siu-yen already mentioned, and various reconnaissance in force by Keller’s main body and by Rennenkampf’s Cossacks farther inland, all was quiet along the Motienling front. Kuropatkin,enchancing himself carefully about Feng-hwang-cheng, intending if attacked by the Russian main army, to defend to the last extremity the ground and the prestige gained on the 1st of May.

From this point to the culmination of the advance at Liao-Yang, the situation of the Japanese closely resembles that of the Prussians in 1866. Haicheng represents Münchgrätz, Liao-Yang Gitschin, and the passes east of Liao-Yang Nachod and Trautenau. The concentration of the various Japanese armies on one battlefield was to be made, not along the circumference of the long arc they occupied, but towards the centre. Similarly, Kuropatkin was in the position of Benedek. He possessed the interior lines and the central reserve which enables interior lines to be utilized, and a stroke of good fortune prolonged the period in which he could command the situation, for

1 This was the 2nd Army, waiting in the port of Chirnampa for the moment to sail for Pitszewo.
2 A letter which deserves mention took place at this time, the bold raid of Colonel Madritov and 500 Cossacks against the communications of the 1st Army. The raid (involving a ride of 240 m. forward and back) was carried out in entire ignorance of the battle of the Yalu, and on arriving at Anju Madritov found nothing to attack, the 1st Army having after its victory abandoned a short line of communication from a sea base near the Yalu mouth. This incident suggests two reflections—first that raids or attacks in rear of the “centre of operations” are valueless, however daring; and second that had Zasulich, in his determination to be worthy of his knighthood, concentrated for battle, the presence of the Madritov detachment on the field would have prevented the lamentable and costly misunderstandings of the retreat on Hamatan.

3 The occupation of Siu-yen was chiefly the work of the brigade pushed out to his left by Kuroki. Only a portion of the 10th division from Takushan helped to drive away Mishchenko’s Cossacks.
on the 23rd of June an unexpected sortie of the Russian Port Arthur squadron paralysed the Japanese land offensive. In the squadron were seen the battleships damaged in the February attacks, and the balance of force was now against Togo, who had lost the “Yashima” and the “Hatsuse.” The squadron nevertheless tamely returned to harbour, Togo resumed the blockade and Nogi began his advance from Nanshan, but the 2nd and 4th Armies came to a standstill at once (naval escort for their sea-borne supplies being no longer available), and the 1st Army, whose turn to advance had just arrived, only pushed ahead a few miles to cover a larger supply area. On the 1st of July the Vladivostok squadron appeared in the Tsushima Straits, and then vanished to an unknown destination, and whether this intensified the anxiety of the Japanese or not, it is the fact that the 2nd Army halted for eleven days at Kaipin, bringing the next on its right, 4th Army, to a standstill likewise. Its next advance brought it to the fortified position of Tashichiao, where Kuropatkin had, by drawing heavily upon his central reserve and even on the Eastern Detachment, massed about two army corps.

On the 24th Oku attacked, but the Russian general, Zarubayev, handled his troops very skilfully, and the Japanese were repulsed with a loss of 1200 men. Zarubayev, who had used only about half his forces in the battle, nevertheless retired in the night, fearing to be cut off by a descender of the approaching 4th Army on Haicheng, and well content to have broken the spell of defeat. Oku renewed the attack next day, but found only a rearguard in front of him, and without following up the retiring Russians he again halted for six days before proceeding to Haicheng to effect a junction with the 4th Army (Nozu), which meantime had won a number of minor actions and forced the passage of the mountains at Fenshulling South.\footnote{The 5th division of the 2nd Army had been sent to join the 10th as the latter approached Hsiumucheng. The Guard brigade of Kuroki’s army which had served with Nozu in the advance had now returned to Feng-hwang-cheng.}

The 1st Army, after its long halt at Feng-hwang-cheng, which was employed in minutely organizing the supply service—a task of exceptional difficulty in these roadless mountains—opened the campaign on the 24th of June, but only tentatively on account of the discouraging news from Port Arthur. A tremendous rainstorm imposed further delays, for the coolies and the native transport that had been laboriously collected scattered in all directions. The Motienling pass, however, had been seized without difficulty, and Keller’s power of counter-attack had been reduced to nothing by the despatch of most of his forces to the concentration at Tashichiao. But Oku’s 2nd Army was now at a standstill at Kaipin, and until he was further advanced the 1st Army could not press forward. The captured passes were therefore fortified (as Feng-hwang-cheng had been) for passive resistance. This, and the movements of the 4th Army, which had set its face towards Haicheng and no longer seemed to be part of a threat on Liao-Yang, led to the idea being entertained at Kuropatkin’s headquarters that the centre of gravity was shifting to the south. To clear up the situation Keller’s force was augmented and ordered to attack Kuroki. It was repulsed with a loss of nearly 1000 men in the action at Tashichiao (17th July) but it was at least ascertained that considerable forces were still on the Japanese right, and upon the arrival of a fresh army corps from Europe Kuropatkin announced his intention of attacking Kuroki. And in effect he succeeded in concentrating the equivalent of an army corps, in addition to Keller’s force, opposite to Kuroki’s right. But having secured this advantage he stood still for five days, and Kuroki had ample time to make his arrangements. The Japanese general occupied some 20 m. of front in two halves, separated by 6 m. of impassable mountain, and knowing well the danger of a “cordon” defensive, he met the crisis in another and a bolder fashion. Calling in the brigade detached to the assistance of Nozu as well as all other available fractions of his scattered army, he himself attacked on the 31st of July, all along the line. It was little more than an assertion of his will to conquer, but it was effective. On his left wing the attacks of the Guard and 2nd divisions (action of Yang-tzu-ling) on the Russian front and flank failed, the frontal attack because of the resolute defence, the flank attack from sheer fatigue of the troops. Count Keller was killed in the defence. Meantime on the Japanese right the 12th division attacked the large bodies of troops that Kuropatkin had massed (Yu-shu-ling) equally in vain. But one marked success was achieved by the Japanese. The Russian 35th and 36th regiments (10th European Corps) were caught between two advancing columns, and, thanks to the initiative of one of the column leaders, Okasaki, destroyed. At night, discouraged on each wing by the fall of Count Keller and the fate of the 35th and 36th, the whole Russian force retired to Anping, with a loss of 2400, to the Japanese 1000 men.

This was the only manifestation of the offensive spirit on Kuropatkin’s part during the six months of marking time. It was for defence, sometimes partial and elastic, sometimes rigid and “at-all-costs,” that he had made his dispositions throughout. His policy now was to test the strength of Liao-Yang as slowly as possible and to defend himself in a series of concentric prepared positions. In his orders for the battle around his stronghold there is no word of counter-attack, and his central mass, the special weapon of the commander-in-chief, he gave over to Bilderling and to Zarubayev to strengthen the defence in their respective sections or posted for the protection of his line of retreat. Nevertheless he had every intention of delivering a heavy and decisive counterstroke when the right moment should come, and meantime his defensive tactics would certainly have full play on this prearranged battlefield with its elaborate redoubts, bombproofs and obstacles, and its garrison of a strength obviously equal (and in reality superior) to that of the assailants.

The Japanese, too, had effected their object, and as they converged on their objective, the inner flanks of the three armies had been erected and the supreme commander Marshal Oyama had taken command of the whole. But, as the event was to prove, the military policy of Japan had failed to produce the requisite number of men for the desired Sedan, and so, instead of boldly pushing out the 1st Army to such a distance that it could manoeuvre, as Moltke did in 1866 and 1870, he attached it to the general line of battle. It was not in two or three powerful groups but in one long chain of seven deployed divisions that the advance was made.

On the 25th of August the 2nd and 4th Armies from Haicheng and the 1st Army from the Yen-tsu-ling and Yu-shu-ling began the last stage of their convergent advance. The Russian first position extended in a semicircle from Anshantien (on the Liao-Yang-Hai-cheng railway) into the hills at Anping, and thence to the Taisse river above Liao-Yang; both sides had mixed detachments farther out on the flanks. The first step in the Japanese plan was the advance of Kuroki’s army to Anping. Throughout the 25th, 26th, 27th, and 28th of August, Kuroki advanced, fighting heavily along the line, until on the night of the 26th the defenders gave up the contested ground at Anping. Hitherto there had only been skirmishing on a large scale on the side of Hai-cheng. Kuropatkin having already drawn in his line of defence on the south side towards Liao-Yang, the 2nd and 4th Japanese Armies delivered what was practically a blow in the air. But on the 27th there was a marked change in the Japanese plan. The right of the 1st Army, when about to continue the advance west on Liao-Yang, was diverted northward by Oyama’s orders and ordered to prepare to cross the Taitzseho. The retirement of the Russian Southern Force into its entrenchments emboldened the Japanese commander-in-chief to imitate Moltke’s method to the full. On the 28th, however, the 1st Army made scarcely any progress. The right (12th) division reached the upper Taitzseho, but the divisions that were to come up on its left were held fast by their...
On the night of the 30th the first Japanese troops crossed the Taitszeho near Lien-Tao-Wun, and during the 31st three brigades were deployed north of Kwan-tun, facing west. The Russian left wing observed the movement all day, and within its limited local resources made dispositions to meet it. Kuropatkin's opportunity was now come. The remainder of the 2nd division was following the 12th, leaving a nine-mile gap between Kuroki and Nozu, as well as the river. It was not into this gap, which had no military significance, but upon the isolated divisions of the 1st Army that the Russian general proposed to launch his counterstroke. Reorganizing his southern defences on a shorter front, so as to regain possession of the reserves that he had so liberally given away to his subordinates, he began to collect large bodies of troops opposite Kuroki, while Stakelberg and Zarubayev, before withdrawing silently into the lines or rather the fortress of Liao-Yang, again repulsed Oku's determined attacks on the south side. But it was not in confidence of victory that Kuropatkin began the execution of the new plan—rather as a desperate expedient to avoid being cut off by the 1st Army, whose strength he greatly overestimated.

On the morning of the 1st of September—the anniversary of Sedan, as the Japanese officers told their men—Oyama, whose intentions the active Kuroki had somewhat outrun, delivered a last attack with the 2nd and 4th Armies, and the Guard on the south front, in the hope of keeping the main body of the Russians occupied and so assisting Kuroki, but the assailants encountered no resistance, Zarubayev having already retired into the fortress. North of the Taitszeho the crisis was approaching. Kuroki's left, near the river, vigorously attacked a hill called Manjuyama which formed part of the line of defence of the XVII. Corps from Europe. But the right of the 1st Army (12th division) was threatened by the gathering storm of the counter-stroke from the side of Yentai Mines, and had it not been that the resolute Okasaki continued the attack on Manjuyama alone, the Japanese offensive would have come to a standstill. Manjuyama, thanks to the courage of the army commander and of a single brigadier, was at last carried after nightfall, and the dislodged Russians made two counter-attacks in the dark before they would acknowledge themselves beaten. Next morning, when Kuroki, who had conceived the mistaken idea of a general retreat of the Russians on Mukden, was preparing...
RUSSO-JAPANESE WAR

926

to pursue, the storm broke. Kuropatkin had drawn together seven divisions on the left rear of the XVII Corps, the strength of the whole being about 90,000. On the extreme left was Orlov's brigade of all arms at Yentai Mines, then came the I. Siberian Corps (Stakelberg), then the X. Corps, then the XVII. But Orlov, perplexed by conflicting instructions and caught in an unfavourable situation by a brigade of the 17th division which was executing the proposed "pursuit," gave way—part of his force in actual rout—and the cavalry that was with him was driven back by the Kobi (reserve army) brigade of the Guards. The fugitives of Orlov's command disordered the on-coming corps of Stakelberg, and the outer flank of the great counterstroke that was to have rolled up Kuroki's thin line came to an entire standstill. Meantime the X. Corps furiously attacked Okasaki on the Manjuyama, and though its first assault drove in a portion of Okasaki's line, a second and a third, made in the night, failed to shake the constancy of the 17th brigade. Misunderstandings and movements at cross-purposes multiplied on the Russian side, and at midnight Kuropatkin at last obtained information of events on the side of Yentai Mines. This was to the effect that Orlov was routed, Stakelberg's command much shaken, and at the same time Yentai, from whom Oku and Nozu had pressed a last furious attack, reported that he had only a handful of troops still in reserve. Then Kuropatkin's resolution collapsed, although about three divisions were still intact, and he gave the order to retreat to Mukden.

Thus the Japanese had won their great victory with inferior forces, thanks "in the first instance to the defection of General Orlov. But at least as large a share in the ruin of the Russian operations must be attributed to the steadfast gallantry of the 17th brigade on Manjuyama." The losses of the Japanese totalled 23,000, those of the Russians 19,000. Coming, as it did, at a moment when the first attacks on Port Arthur had been repulsed with heavy losses, this brilliantly successful climax of the four months' campaign more than restored the balance. But it was not the expected Sedan. Had the two divisions still kept in Japan been present Kuroki would have had the balance of force on his side, the Russian retreat would have been confused, if not actually a rout, and the war would have been ended on Japan's own terms. As it was, after another day's fighting, Kuropatkin drew off the whole of his forces in safety, sharply repulsing an attempt at pursuit made by part of the 17th division on the 4th of September. The railway still delivered 30,000 men a month at Mukden, and Japan had for a time outrun her resources. At St Petersburg the talk was not of peace but of victory, and after a period of reorganization the Russians advanced afresh to a new trial of strength. But the remainder of the Manchurian campaign, like the second half of the war of 1859, was nothing more than a series of violent and restless encounters of huge armies—armies far larger than those which had fought out the real struggle for supremacy at Liao-Yang and Magenta.

At this time the siege of Port Arthur had only progressed so far that the besiegers were able to realize the difficulties before them. Nogi landed 25,000 men, and by the 19th of July had almost separated itself from Oku's and got into position for the advance on Port Arthur. Dalny, the commercial harbour, was seized without fighting, and a month was spent in preparing a base that the Russian retreat would have been confused, if not actually a rout, and the war would have been ended on Japan's own terms. As it was, after another day's fighting, Kuropatkin drew off the whole of his forces in safety, sharply repulsing an attempt at pursuit made by part of the 17th division on the 4th of September. The railway still delivered 30,000 men a month at Mukden, and Japan had for a time outrun her resources. At St Petersburg the talk was not of peace but of victory, and after a period of reorganization the Russians advanced afresh to a new trial of strength. But the remainder of the Manchurian campaign, like the second half of the war of 1859, was nothing more than a series of violent and restless encounters of huge armies—armies far larger than those which had fought out the real struggle for supremacy at Liao-Yang and Magenta.

The defences of Port Arthur, as designed by the Russians in 1900, and owing to the meagre allotment of funds only partially carried out before the war, had some tincture, but no more, of modern continental ideas. There was a continuous enceinte of plain trace round the Old Town, at a distance of 1000 to 2000 yds. from it, which had not and could not have had any influence on the issue of the siege. The main line of defence followed the outer edge of the amphitheatres of hills surrounding the harbour. These hills are almost inaccessible. The greatest descent from the top of them being some 4000 yds. from the Old Town. West of the Lun river the defensive line offered by the hills is less defined, and the line adopted for the permanent works was on the north only a few yds. beyond the line of the old town. Running S.W. and S. back to the coast, it gradually draws in quite close to the S.W. end of the harbour. The total length of this line from sea to sea is some 12 m. Its most obvious weakness is the hill of Manjuyama, 1300 ft. above sea-level, the now famous "203-Metre Hill" overlooks both. Here it had been intended to construct permanent works, but considerations of expenditure had caused this to be deferred.

On this main line of defence some seven or eight permanent works had been prepared (it is difficult to say how many, for most of the concrete works were better than semi-permanent in character). Some of these had been prepared with interior parapets and platforms of concrete for medium guns. Fort Erh-Lung was of this character. The general design appears to have been grounded on the French detached forts of the "sevesses" (see FOOTNOTES), as the front parapet was designed for infantry and the interior, 10 ft. higher, for guns. The ditch, 30 ft. deep, excavated in the rock, was flanked by counterscarp galleries. The living casemates were divided into two stories by a gallery, and in the interior there was no covered communication between these casemates and the parapets. Fort Chi-Kuan had no artillery parapet. The ditch, 12 to 15 ft. deep, was defended by counterscarp galleries. The casemates were kept apart by a corrie, and the territories of the corries off from the terreplein by a couple of deep sunk yards or areas, could be defended in the last resort as a keep. In addition to this the terreplein was entrenched. In both of these forts the parapet is of masonry, and the parapet and parapet parapets are embrasure. It is possible that these were embryonic "batteries traditore" to flank the intervals. Fort Sung-Shu was of the same type as Chi-Kuan. These three were the only permanent forts seriously attacked.

The permanent works were supplemented before the siege began by the rapid development of semi-permanent works and trenches. Every knoll had its redoubt or battery, and the trenches were arranged line behind line, to give supporting, cross and enfilade fire in every direction. Thus on the north front, from Chi-Kuan battery to Sung-Shu, a distance of about two miles, there were three permanent forts and seven semi-permanent works and batteries. Behind these was the "Chinese Wall," and behind that more batteries and trenches. On the north-west front, 203-Metre Hill, in the immediate approach of the main line of permanent works, with trenches and redoubts to either flank; and 174-Metre Hill, 1500 yds. beyond it, was also held. The Lun-Ho valley where it cut through the line was closed by entanglements and swamps. On the other side the centre, the Waterworks Redoubt, a semi-permanent work covering the Port Arthur water supply, and connected by trenches with the four Temple Redoubts a mile away to the west, formed a strong position. These were connected by entangled lines in front of the defences, but they were not of a strong type. The Russians, with the resources of their fleet at their disposal (just as at Sevastopol), used great numbers of machine guns and electric lights, and the available garrison at first was probably, including sailors, 42,000 men.

Such were the defences that the Japanese attacked, with a force at the outset (30th of July) little more than superior numerically to the defenders, and an entirely inadequate siege train (16 6-in. howitzers, 6 7-inch guns and 300 machine guns). Their defences were perfectly in accordance with the strength of the position and the nature of the defences. Recollections of their easy triumph in 1894 and perhaps thoughts of Sevastopol, German theories of the "brusque attack," the fiery ardour of the army, and above all the need of rapidly crushing the enemy in harbour, combined to suggest a bombardment and general assault. The bombardment began on the 19th of August and continued for three days, while the infantry was spreading along the front and gaining ground when it could. The real assault was made on the night of the 21st on the two Pan-Lung forts (semi-permanent) on the centre of the north-eastern front. The fighting was of the utmost severity, and continued through the 22nd; and although the stormers captured some small redoubts, they were repulsed with heavy losses. Their progress under the fire of the permanent forts Erh-Lung and Chi-Kuan on either side of, and the Wan-tai fort behind, Pan-Lung. Every attempt to bring up supports to the captured positions failed, and the stormers were surrounded. On the night of the 23rd-24th, just as the assault was being renewed, Stessel delivered a fierce counter-attack against the lost positions, and the result of an all-night battle was that though the forts were not captured, the assault was repulsed with over 5000 casualties, and the Japanese in Pan-Lung were isolated. This sortie raised the spirits of the Russians to the highest pitch. They seemed indeed to have broken the spell of defeat. On the Japanese side 15,000
men had been killed and wounded in three weeks. The Russians strengthened their works around the captured forts in such a way as effectually to prevent farther advance, and the Japanese 3rd Army had now to resist itself to a methodical siege. Small sorties, partial attacks and duels between the Japanese guns and the generally more powerful ordnance of the fortress continued.

The siege approaches were first directed against the Temple-Waterworks group, which was stormed on the 19th and 20th of September. Pan-Lung was connected with the 203-Metre Hill. The Japanese were now beginning to pay more attention to the western side of the fortress, and from the 19th to the 22nd there was hard fighting around 203-Metre Hill, the attack being eventually repulsed with the loss of 2000 men. Operations in the west were thereupon abandoned for the time being, and the eastern forts remained the principal objective of the attack. Heavier howitzers had been sent from Japan, and on the 1st of October the first batteries of 28 centimetre (11 in.) howitzers came into action. They fired a shell weighing 485 lb. with a bursting charge of 17 lb. On the 12th, the Japanese took the trenches between the Waterworks Redoubt and Erh-Lung, and cut the water-supply. Saps were then pushed against Erh-Lung, and to help in their progress a Russian advance work called "G" was constructed on the 16th, by a skilfully combined attack of infantry and artillery.

From this time forward there was a desperate struggle at the saps heads on the north front. 1

On the 26th of October another assault was made on Chi-Kuan and Fort and Battery, and was continued at intervals, varied by Russian counter-attacks, till the 2nd of November. By this time the Japanese were becoming disheartened. They had incurred an additional loss of 13,000 men without substantial gain, except a lodgment on the counterscarp of Sung-Shu. This prepared the way for mining, which had already been begun at Erh-Lung. On the 17th of November seven mines were exploded at Sung-Shu, which blew in the back of the counterscarp galleries. At Erh-Lung on the 20th of November three mines were exploded, which filled the ditch, and the Japanese later on sapped across to the escarp over the débris. At Chi-Kuan, the counterscarp gallery had been breached by an ill-managed Russian mine on the 23rd of October and the Japanese got in through the breach and made a lodgment. They did not, however, get possession of the whole of the counterscarp galleries before about the middle of November. On the 22nd of November the Japanese assaulted the trench round Chi-Kuan battery. It was captured and retaken by counter-attack twice between 6 p.m. and 1 a.m. In this fight each side was using corseps as breastworks.

On the 26th of November another assault was made on the same lines as that of the 30th of October. By this time the besiegers were setting the breaches of the northern forts, and it would have been better to delay. But the situation was serious in the extreme. In Manchuria Kuropatkin's army had reasserted itself. From Europe Rozhestvenski's squadron was just setting sail for the Far East. Marshal Oyama sent his principal staff officers to stimulate Nogi to fresh efforts, and some exhausted units of the besieging army were replaced by fresh troops from Japan. With 100,000 men and this urgent need of immediate victory, Nogi and the marshal's staff officers felt bound to make a third general assault. The siege works had indeed made considerable progress. The ditches of Sung-Shu and Erh-Lung were partially filled. They held most of the ditch of Chi-Kuan Fort and were cutting down the escarp, and two parallels had been made only 30 yds. from the Chinese Wall at 4 G and Pan-Lung.

The general attack was made at 1 p.m. At Sung-Shu the stormers got into the fort, but suffered much from the artillery on the western side of the Lun-ho valley, and were beaten out of it again in 20 minutes; 2000 men tried in vain to get up the Lun-ho valley to take Sung-Shu in rear. At Erh-Lung they could not get over the outer parapet. At 4 G they took a portion of the Chinese Wall and lost...
mountains. Japan had partially accomplished her task, but had employed all her trained men in this partial accomplishment. It was questionable, even in October 1904, whether she could endure the drain of men and money, if it were prolonged much further. On the other hand, in Russia opposition to the war, which had never been popular, gradually became the central feature of a widespread movement against irresponsible government. Thus while the armies in Manchuria faced one another with very little appearance of confidence, behind them the situation was exceedingly grave for both parties. A state of equilibrium was established, only momentarily disturbed by Kuropatkin’s offensive on the Sha-ho in October, and by the Sandepu incident in the winter, until at last Oyama fought a battle on a grand scale and won it. Even then, however, the results fell far short of anticipation, and the armies settled down into equilibrium again.

After the battle of Liao-Yang Kuropatkin reverted far more to the old positions and had a struggle at Tielin Port. Finally, however, it was important to hold Mukden, the Manchurian capital, and since the Japanese, as on previous occasions, reorganized instead of pursuing, he decided to stand his ground, a resolution which was shown by the gathering of fresh troops, in strength day by day, and aware that the Japanese had outrun their powers, he resolved, in spite of the despondency of many of his senior officers, to take the offensive. He disposed of about 200,000 men, while the Japanese had 270,000; he entrenched north of Liao-Yang, from a point 9 m. west of the railway, through Yentai Station and Yentai Mines, to the hills farther east. There had been a good deal of rain, and the ground was heavy. Kuropatkin decided to move his forces to Kaimura, the finishing line of the railways on the hills with his eastern wing (Stakelberg), to move his western wing (Bilderling) slowly southwards, entrapping each strip of ground gained, and finally with the centre—i.e. Bilderling’s left—and the rear (Oyama) in reserve. He consequently decided to make a grand attack with the Japanese right, keeping the 4th Army (Nozu) and the 2nd Army (Oku) in countenance by means of Bilderling’s main body. The manoeuvre began on the 5th of October, and by the evening of the 7th the batteries of Bilderling were 50 m. east of the Kaimura hills, with the 1st Army and 2nd Army all provisioned and ready for the battle. Bilderling’s left, however, could not be located, and his right had been anticipated. Still, Bilderling crossed the Sha-ho and made some progress towards Yentai, and the demonstration was so far effective that Kuroki’s warnings were almost disregarded by the Japanese headquarters. The battle of the 7th of October was the last of the battles, the Japanese took advantage of the fall of the Sha-ho and crossed the Kaimura hills, and Stakelberg found the greatest trouble in deploying his forces for action in this difficult country. Oyama became convinced of the truth of the 9th and 10th, and prepared a grand attack, but the 2nd Army could only offer a feeble resistance, being left to defend at least 15 m. of front, and the entire 2nd and 4th Armies and the general reserves were to be thrown upon Bilderling. On the 11th the real battle opened. Bilderling displayed the greatest skill, but he was opposed by enormous forces. He was pressed back, but the four-to-one advantage of the Russians, and retired, having made the enemy advance. Still the result of Stakelberg’s attack, for which he was unable to deploy his whole force, was disappointing, but the main Japanese attack on Bilderling was not much more satisfactory, for the Russians had reached the cross-step of their previous advance, and fought splendidly. The Russian commander-in-chief states in his work on the war that Bilderling became engaged in a fight of gradually withdrawing as Kuropatkin intended, and at any rate it is certain that the two divisions of Oyama’s army were maintained on the western wing, not only did Stakelberg use his reserves to support Bilderling, when the 12th division of Kuroki’s army was almost at its last gasp and must have yielded to fresh pressure, but he united the 1st Army to Oyama’s army, and the entire 13th and 14th October. In the fighting of the 15th–16th of October the Russians gradually gave back as far as the line of the Sha-ho, the Japanese following until the armies faced roughly north and south on parallel fronts. At the fighting of the 14th of October, in engaging and defeating the Russian Vladivostock forces, led by (Admiral Jensen). Thus the Russian field disappeared from the Pacific, and thenceforward only the Baltic fleet could hope to seriously challenge the supremacy of the Japanese navy.

The remainder of the war on land, although it included two battles on a large scale and numerous minor operations, was principally a test of endurance. After Liao-Yang there were no extended operations, the area of conflict being confined to the plain of the coast side of the Hun-ho and the fringe of the

1 As regards food and ammunition, the resources of the defence were not as by any means exhausted, and General Stessel and other senior officers of the defence were tried by councils of war, and some of them convicted, on the charge of premature surrender.
of Oyama's forces (January 8th-16th) the only change in the relative positions of Oyama and Kuropatkin as they stood after the battle of the Sha-ho was that the Japanese had extended somewhat westwards towards the Hun-ho. The Russians, 300,000 strong, were now organized in three armies, commanded by Generals Limeich, Grippenberg and Kaulbars; the total strength of the Japanese 1st, 2nd and 4th Armies and reserve was estimated by the Russians at 220,000. Towards the end of January, Kuropatkin took the offensive. He wished to inflict a severe blow before the enemy could be reinforced by the late besiegers of Port Arthur, and sent Grippenberg with seven divisions against Oku's two on the Japanese left. The battle of Sandepi (Helkoutai), fought in a terrible snowstorm on the 26th and 27th of January 1905, came near to being a great Russian victory. But the usual dénouement of Russian operations and their own magnificent-resistance saved the Japanese, and after two days' severe fighting, although Grippenberg had not been checked, Kuropatkin, in face of a counter-attack by Oyama, decided to abandon the attempt. The losses were roughly 8000 Japanese to over 10,000 Russians.

Both sides stood fast in the old positions up to the verge of the last and greatest battle. Kuropatkin was reinforced, and appointed Kaulbars to succeed Grippenberg and Bilderling to the command of the 3rd Army vacated by Kaulbars. On the other hand, Nogi's 3rd Army, released by the fall of Port Arthur, was brought up on the Japanese left, and a new army under Kawamura (5th), formed of one of the Port Arthur and two reserve divisions, was working from the upper Yalu through the mountains towards the Russian left rear. The Russian line in front of Mukden from the Hun-ho, through the Put-lin and Novgorod hills on the Shaho, to the mountains, was 47 m. long, the armies from right to left being II. (Kaulbars), III. (Bilderling) and I. (Linievich); a general reserve was at Mukden. On the other side from left to right, on a line 40 m. long, were Oku (2nd Army), Nozu (4th), Kuroki (1st) and Kawamura (5th), the general reserve in rear of the centre at Yentai and the 3rd Army in rear of Oku. Each side had about 310,000 men present. The entire front of both armies was heavily entrenched. The Russians had another offensive in contemplation when the Japanese forestalled them by advancing on the 21st of February. The 5th Army gradually drove in Kuropatkin's small detachments in the mountains, and came up in line with Kuroki, threatening to envelop the Russian left. The events on this side and misleading information induced Kuropatkin to pay particular attention to his left. The Japanese 1st and 5th Armies were now engaged (25th February), and elsewhere all was quiet. But on the 27th the fighting spread to the centre, and Nogi (originally behind Oku) was on the march to envelop the Russian right. He was held under observation throughout by Russian cavalry, but it seems that little attention was paid to their reports by Kuropatkin, who was still occupied with Kuroki and Kawamura, and even denied his right of its reserves to reinforce his left. With a battle-front exceeding two days' marches the wrong distribution of reserves by both sides was a grave misfortune. Kuropatkin was at last convinced, on the 28th of February, of the danger from the west, and did all in his power to form a solid line of defence on the west side of Mukden. Nogi's first attack (1st-2nd March) had not much success, and a heavy counterstroke was delivered on the 2nd. Fighting for localities and alterations in the interior distribution of the opposing forces occupied much time, and by the 3rd, though the battle had become severe, Kuropatkin had merely drawn in his right and right centre (now facing W. and S.W. respectively) a little nearer Mukden. His centre on the Sha-ho held firm, Kuroki and Kawamura made but slight progress against his left in the mountains. Nogi and Oyama were equally impressed with the strength of the new (west) Russian front, and like Grant at Petersburg in 1864, extended farther and farther to the outer flank, the Russians following suit. The Japanese marshal now sent up his army reserve, which had been kept far to the rear at Yentai, to help Nogi. It was not before the evening of the 6th of March that it came up with the 3rd Army and was placed in position opposite the centre of the Russian west front. On
the rest of the line severe local fighting had continued, but
the Russian positions were quite unshaken, and Kuroptak's
reserves—which would have been invaluable in filling up the
counter-attack of the 2nd of March—had returned to face Nogi.
He had organized another counterstroke for the 6th, to be led
by Kaulbars, but this collapsed unexpectedly after a brief but
severe fight.

Kuroptak now decided to draw in his centre and left towards
Mukden. On the 7th, the various columns executed their
movement to the Hun-ho with complete success, thanks to
good staff work. The Japanese followed up only slowly. Nogi and
Kaulbars stood fast, facing each other on the west front; after
the arrival of the general reserve, Nogi was able to prolong his
time to the north and eventually to bend inwards towards the
Russian line of retreat. Bilderling and Liniwicz were now
close in to Mukden and along the Hun-ho. On the other side
Oku had taken over part of Nogi's line, thus freeing the 3rd
Army for further extension to the north-west, and the rest of
the 2nd Army, the 4th, the 1st and the 5th were approaching
the Hun-ho from the south (March 8th). On this day the
fighting between Nogi and Kaulbars was very severe, and
Kuroptak now made up his mind to retreat toward Tieling.
On the 9th, by Oyama's orders, Nogi extended his
headquarters to the northeast. On the 10th, Oku now occupied
the entire line of the 3rd Army. Nogu alone was left on the south
front, and Kuroki and Kawayama began to engage Liniwicz seriously.
But Nogi had not yet reached the Mukden-Tieling railway when, on the
night of the 9th, every preparation having been made, Kuroptak's
retreat began. On the 10th, covered by Kaulbars, who held off
Nogi, and by strong rearguards at and east of Mukden, the
movement continued, and though it was not executed with
entire precision, and the rearguards suffered very heavily,
the Russians managed to draw off in safety to the northward.
On the evening of the 10th, after all their long and hardly contested
engaging marches, Nogi's left and Kawayama's right met north
of Mukden. The circle was complete, but there were no Russians
in the centre, and a map of the positions of the Japanese on the
evening of the 10th shows the seventeen divisions thereof
mixed up and pointing in every direction but that of the enemy.
Thus the further pursuit of the Russians could only be undertaken
after an interval of a few hours, by the 3rd Army. To the right
and rear of the Russian troops was the 3rd Army. But the material loss
incurred on the Russians was far heavier than it had ever been
before. It is generally estimated that the Russian losses were
no less than 97,000, and the Japanese between 49,000 and 50,000.
Japan had to put forth her supreme effort for the battle;
while of Russia's whole strength not one-tenth had been used.
But Russia's strength in Europe, with but one line whereby it
could be brought to bear in the Far East, was immaterial, and
on the theatre of war a quarter of the Russian field forces had
been killed, wounded or taken.

It remains to narrate briefly the tragic career of the Russian
Baltic fleet. Leaving Libau on the 13th-14th of October 1904, the
fleet steamed down the North Sea, expecting every night
to be attacked by torpedo-boats. On the 21st, in their
excitement, they opened fire on a fleet of British trawlers
in the English Channel, killing several. On the evening of the
27th, at the head of the fleet, the battleship Russian,
commanded by Captain L. S. T. Rozhestvenski, head of the fall of Port Arthur, and the question of
returning to Russia arose. But a reinforcement under Rear-
Admiral Nebogatov was dispatched from the Baltic via Suez
in the British steamer-Duke's Bank (57), and several others.
Rozhestvenski had, moreover, numerous store-ships, collers, &c.
Nevertheless, the Japanese viewed his approach with considerable anxiety,
and braced themselves for a final struggle. Of the various courses
open to him, Togo prudently chose that of awaiting Rozhestvenski
in home waters. The Russians left Kamranh on the 14th of May,
and for a time disappeared into the Pacific. It was assumed that

they were making for Vladivostok either via Tsushima strait or by
the Pacific. Rozhestvenski chose the former course, and on the 27th of
May the fleets met near Tsushima. About 1:45 p.m., the
Russians, who were still in a close cruising formation,
attacked on the right of the Japanese fleet, which had
proceeded unexpectedly towards E. Togo, concentrating his fire on each ship in succession, and seek-
ing by superior speed to head off the Russians, now inclined to the S.E., and the Russians (confront, At 3, the Russian flagship
"Saghalien") was taken aback by a sudden shower of fire.
Rozhestvenski himself had been wounded, and the command had
devolved on Nebogatov. Shortly afterwards the Russians suddenly turned
N., and sought to pass across the wake of Togo's battle-ship, up
through the Japanese squadron, which had come to the rear of him, and
sent the rearward, covered by the rear ships, which ran past them
on the original course and then came round in succession; this
manœuvre was so well executed that the Japanese again headed off
their enemy, who swerved for the second time towards the E.
But this was the last time they executed the same manoevre as before,
and steamed S.E. again (about 4:40). They were not unscathed,
but the Russians were suffering far more severely. Meanwhile,
the cruisers on both sides had been heavily engaged. The Russian
cruisers were now pouring their whole fire upon the Japanese
and were moving at a very superior speed, ran S., E. and E. across the rear
of the enemy's main squadron, and about 3 ranged upon the
Russian cruisers. The latter were slower, and hampered by the
crossing of many damaged vessels before and behind them, and
were among the greatest confusion, which was presently increased
by the battle-line squadron, now turned back and heading W.,
with Togo in pursuit. The Russians again broke out northward;
but some of the Japanese squadrons hung on to them so tenaciously
of the battle-ship, and the others dealt with the numerous Russian vessels
that were unable to keep up. Then Togo called off his ships, and
gave the torpedo craft and room in the night in which to act. At
daylight the larger ships joined in again, and before long the whole
Russian fleet, with few exceptions, had been captured or sunk.

After the disasters of Mukden and Tsushima, and being
threatened with internal disorder in European Russia, the tsar,
early in June, accepted the mediation of the president of the

RUSSO-TURKISH WARS (1828-29 and 1877-78). The earlier wars between Russia and Turkey possess little military interest to-day, and are scarcely remembered except as the occasion of Suvarov's exploits. The first of the three 19th-century (1806-1812) wars, however, though much less vigorously fought than the preceding wars, at any rate introduced the "Eastern question" into European politics as a factor affecting the balance of power, and its cessation at the moment of Napoleon's advance on Moscow had a great effect on the emperor's Russian campaign.

The second war was more celebrated. It was a reflex of the Greek War of Independence, and began with the invasion of Rumania by the Russians in May 1828. One corps invested and took Braila, another passed by Bucharest and besieged Rustchuk and Silistria, and a third crossed the Danube below Isacka. The first and the last were united as an army under the tsar and advanced through the Dobrudja on Shumla. But after a considerable amount of fighting it was decided that the Turks here were too strong for the invaders, and the tsar drew off his forces by degrees towards Varna, which was besieged next. But the Shumla troops were thus gradually set free to join the Turkish field army under the grand vizier, which, however, merely menaced, without seriously attacking, the besiegers of Varna. The place surrendered on the 10th of October 1828, and the tsar at once turned upon the grand vizier, attacked him on the river Kamchik (15th October) and forced him to retreat to Aydos.

Meantime, however, Silistria offered a gallant resistance. Even when the besiegers were reinforced from the main army they could not master the defence, and when winter came on the siege was abandoned, and the Russians drew off into Rumania into winter quarters. In Asia, meanwhile, a Russian army under Prince Paskievich had advanced from Tiflis, and captured Kars and other places, while the Black Sea fleet secured the surrender of Poti. Paskievich next defeated the Turks at Akhalzik (27th August), captured Ardahan, and advanced by Bayazid to the upper Euphrates. But coming there into conflict with the fierce Kurds, he gave up further enterprises and, leaving garrisons in the strong places, took his army back into the Caucasus for the winter.

In 1829 Diebitsch took over the command of the 70,000 men on the Danube, and resolved to carry the war over the Balkans. As a preliminary the fleet seized Sozopolis (Sisepol). A second and vigorously pressed siege of Silistria ended with the surrender of the place on June 30th, the Turkish operations for the expulsion of the Sozopolis garrison and the relief of Silistria being delayed for three weeks. The Russian army was at this time in process of reorganization on a European model, which added to the difficulties of their situation. The grand vizier, Reschid Mehmet, in May attempted to combine the Rustchuk and Shumla garrisons for the expulsion of the Russians from Varna, but unsuccessfully, the two columns being beaten in detail. Soon afterwards Diebitsch, with part of the army investing Silistria, marched against him and defeated him at Tcherkova (11th June). Immediately after this Diebitsch carried out the brilliant passage of the Balkans and advanced to Adrianopole, which laid Constantiopol in his mercy, and brought about an immediate peace. A month after its signature, a Turkish army from the west, attempting to recapture Adrianople behind Diebitsch, was defeated on the 16th October at Arnaut Kalesi. In Asia, meantime, Paskievich, after relieving Akhalzik, where his garrison had been blockaded, won two victories on two successive days at Kainyl and Milli Duzov (1st and 2nd June), and captured a number of fortresses, his victorious advance being arrested only by the terms of peace.

The War of 1877-78.—On 24th April 1877, the tsar declared war against Turkey, with the avowed object of righting the wrongs of the Christians in Turkey. The Turco-Servian war was just over. Contrary to expectation the Turks had proved victorious. Hostilities had ceased in October 1876, though it was not till 1st March 1877 that peace had been signed. During 1876 the Turks had also quelled an insurrection of the Christians in Bulgaria, when the treatment they meted out to the Christians and the cry of "Bulgarian atrocities" had aroused the sentimental sympathies of Europe.

The Danube formed the Turkish frontier. Flowing west to east along the southern boundary of Rumania, it turned to the north and then to the east to the Black Sea, enclosing the Dobrudja, an inhospitable and difficult region, of rectangular shape, some 100 m. N. to S. by 30 to 60 m. E. to W., which was the extreme northern part of the Turkish dominions.

The Russians did not anticipate that the opposition to be encountered from the Turkish forces would be of a serious nature. As for natural obstacles, there were the Danube and the Balkans directly across their route, but the passage of these was not likely to cause any serious delay.

The Turkish fortresses of the Quadrilateral—Rustchuk, Silistria, Shumla and Varna—could be avoided, and Nikopol and Vidin were more or less isolated. It would only be necessary to cover the lines of communication from the action of the garrisons of these places. It was known that Osman Pasha was at Vidin with what remained of the Turkish force which had defeated the Servians the previous year, and it would be necessary to detach a force to operate against him. There would be some delay in the forwarding of supplies, due to the fact that the Rumanian railway was of different gauge to the railways of Russia, but this would not be serious. This line, the only railway through Rumania, ran from Galatz to Bucharest, where one branch ran west by Slatina and the other to Giurgevo on the Danube, where it connected with a line south of the river from Rustchuk to Shumla and Varna through Raggard. It was generally imagined that the advance to Constantinople would be of the nature of a triumphal march. By a clause of the Treaty of Paris of 1856 the Russian naval forces in the Black Sea had been destroyed, and though this clause was revoked in 1871, in 1877 the Turks possessed the undoubted command of the sea. Had things been different, an advance through the Dobrudja, with a safe line of supply by water, would have offered many advantages. Under existing circumstances, with Turkish gunboats on the Danube and ironclads on the Black Sea, such a course was out of the question.

The plan of campaign formed by the Russians was as follows:

One corps was to enter the Dobrudja to protect the line of communication against any Turkish advance east of the Danube, while the remainder would cross the Danube between Rustchuk and Nikopol, cross the Balkans and advance on Adrianopole. Detached forces would meanwhile mask the "Quadrilateral" and the Turkish force at Vidin.

A Convention had been made with Rumania, allowing the passage of the Russians through the country. The Rumanians proclaimed their independence of Turkey, and although the tsar declined their offer of active co-operation for the time being, their troops occupied Calafat, facing Vidin, and early in May their batteries engaged the guns of Vidin across the river. The Russian army with which it was proposed to carry on the war, consisted of six army corps and two rifle brigades. Each corps was formed of one cavalry and two infantry divisions. There were in addition 74 squadrons and 52 guns of Cossacks. Each infantry division had 48, and each cavalry division 12 guns. This force had been mobilized in the November of the previous year, and was now distributed as follows:

**Commander-in-chief** The grand-duke Nicholas, with headquarters at Kishinev.

The mobilization of the IV., XIII., and XIV. Army Corps had been ordered in December 1876, but they would not be ready to move till the following month—May 1877. In
addition to the above, there were heavy artillery with 400 siege guns, engineers with pontoon trains, naval launches, and the necessary supply trains. The total Russian forces numbered 200,000 combatants of all arms, with 850 field and 400 siege guns.

For some months prior to the tsar's declaration, Turkey had realized that war was inevitable, but such preparations as were made were far from adequate. Abdul Kerim, who had commanded in Servia the previous year, was still acting as commander-in-chief, but the task set him was not an easy one. With the Russians in front, the Servians and Montenegrins, whose action was known to be uncertain, on the flank, and the Christian population of Bulgaria, in sympathy with the Russians, in the midst, it required a younger and more energetic man, with a greater knowledge of the art of war than he possessed, to plan and to carry out a successful defence of the Moslem dominions. The prospect of war had aroused the Turks, and the nation had taken steps to prepare for the conflict, but they lacked trained leaders. The Turkish officers were but ill-equipped. Works on the art of war did not exist in the Turkish language General conscription existed in Turkey, but there was an entire absence of organization. Theoretically, each of the six districts into which the empire was divided should have produced an army of four corps, but it was only on paper. Practically the troops were not organized in corps. At the outbreak of war, Osman's force, some 30,000 strong, was at Vidin; a few battalions were spread along the Danube from Vidin to Silistria, with a brigade of infantry at Nikopol, another at Sistova, and the best part of two divisions at Rustchuk. Abdul Kerim's headquarters were at Shumla where there were two more infantry divisions. A cavalry division was in process of organization. Varna was the base of supply and was connected by rail with Shumla and Rustchuk. Suleiman Pasha with some 40,000 men was still in Montenegro. The total Turkish forces in Europe at this time were about 120,000 men with 450 guns, but they were disseminated instead of being concentrated, or grouped in view of a rapid concentration. Abdul Kerim's plan, or rather his idea, was that the Russians would find some difficulty in the first place in forcing the passage of the Danube, and when they had succeeded in this, they would be bound to enter the zone of the Quadrilateral, where he hoped, operating with the fortresses as supports, to deal with them successfully. As regards the Turkish fleet, at the outset, in addition to a fleet of 8 ironclads below Braila, there were 7 monitors and 18 wooden ships of war on the Danube between Hirsova and Vidin.

In the matter of armament the Turks had the advantage. The artillery were armed with a Krupp breech-loading gun, which was better than the Russian bronze gun, while the Peabody-Martini rifles of the infantry were superior to the Russian Krink. The firearm of the Turkish cavalry was the Winchester repeating carbine, which was inferior to the short Berden with which the Russian cavalry was armed. But this advantage in armament was discounted by the fact that, from motives of economy, the Turkish soldier had done but little rifle practice.

Hostilities commenced on the 24th of April, when the Russian army advanced in three columns towards Bucharest, the eastern flank covered by the XI. Corps which marched to Galatz. By the end of May the bulk of the Russian forces were assembled at Bucharest practically opposite the intended point of passage, with the advanced guard under General Skobelev at Giurgevo, and cavalry observing the river line from Turnu Magurei to Kalarashi. It was now decided to await the arrival of the IV., XIII., and XIV. Corps and the necessary bridging material for the passage of the Danube.

On June 15th the troops were disposed as follows: 8th Cavalry Division at Turnu Magurei; 12th at Otelenita; 2nd at Kalarashi; Advanced Guard at Giurgevo; XI. Army Corps at Oltenita and Giurgevo; VIII., XII., XIII., IX., at Bucharest; IX. at Slatina; IV. at Slobozia; XIV. at Galatz; VII. at Odessa; X. in the Crimea. Meanwhile steam launches were brought overland, and the Russians, by means of torpedoes, submarine mines and their shore batteries, had succeeded in clearing the Danube of Turkish vessels between Nikopol and Rustchuk. Two of the smaller ironclads had been sunk, the remainder of the flotilla driven under the shelter of the fortresses, while barricades of mines effectively isolated them and prevented them from again entering the zone of operations. Of the large ironclads on the lower Danube, one was sunk near Sulina, and from that time the remainder stayed in Sulina harbour.

On June 22nd the XIV. Army Corps crossed into the Dobrudja at Galatz and advanced south, the Turkish detachment there retiring before them. Pontoon trains having been brought by rail, the necessary rafts and boats (which had been constructed at Slatina on the Aluta) were floated down to the neighbourhood of Zimnitzia, and on June 24th siege batteries opened fire on Nikopol and Rustchuk, while the IX. Army Corps made a feint of crossing just below Nikopol. These measures were effective in confusing the Turkish commander as to the Russian intentions, and on the night of June 26th, 12 companies of rifles, with a squadron and 6 guns, were landed on the south bank opposite Zimnitzia, and within twenty-four hours the whole of the VIII. Corps had crossed the river. By July 2nd the Russians had completed a bridge over the river, which was 1000 yds. wide at this point. At Sistova was a Turkish brigade of infantry. The commander, in the early morning of the 27th, received information from his outposts of the crossing, but instead of moving with his whole force, sent two battalions to oppose it. The Russians drove them back, and when reinforced, advanced against the heights in rear of Sistova, which were occupied with a loss of 800 men, the Turkish troops retiring to Tirovna and Nikopol. The Turks had remained ignorant of the Russians' concentration in Rumania and no attempt had been made to discover their plans. Abdul Kerim remained inactive in the fortresses of the Quadrilateral, and even when he heard of the crossing at Sistova, decided that it was but a demonstration. No measures were taken to observe the Russians. They were thus able to complete their crossing practically undisturbed, and this although it was never likely that the Russians would voluntarily select a point of passage leading into the Quadrilateral. Everything pointed to a crossing between Nikopol and Rustchuk. The best course for the Turks under existing circumstances would have been to leave garrisons in the fortresses, to observe the river line and to push reconnaissances to the north of the river, and to dispose the field army in a central position, whence it could concentrate on any point as soon as the enemy's intentions were revealed.

On June 30th, Field-Marshal Gurko was put in command of a detachment composed of 10 battalions, 31 squadrons and 32 guns, with which he was ordered to advance rapidly to Tirovna to gain possession of a pass over the Balkans, to damage railways and telegraphs, and to endeavour to stir up a Bulgarian revolt. He crossed the Danube by the Russian bridge on July 3rd and occupied Tirovna on July 7th, the Turkish garrison retiring to Osman Bazar. At Tirovna he learned that the Shipka Pass was occupied by 3000 Turks, and that none of the remaining passes were held in any force. He then determined to cross by the Haikioi Pass and to turn the Shipka. He started from Tirovna on the 12th July, on which day the head of the VIII. Corps reached the town. Haikioi was occupied on the 14th, a detachment of 300 Turks being driven away. Gurko then sent two squadrons to cut the telegraph at Yeni Zagra, and leaving a garrison at Tirovna, took possession of the Shipka Pass. It had been arranged that a force from the VIII. Corps should attack the Shipka Pass (q.v.), from the north on the 17th, Gurko attacking simultaneously from the south; but his advance was delayed
by small bodies of the enemy, and he failed to co-operate, with the result that the attack from the north was repulsed. The Turkish commander, however, evacuated the pass that night (July 18th/19th). It was occupied by the Russians on July 19th, and held till the end of the war. Gurko's detachment was followed across the Danube bridge by the XII. and XIII. Army Corps, which crossed between July 3rd and 8th and moved towards the Janta river; the IX. Corps was across by July 10th and advanced on Nikopol; the XI. Corps crossed July 10th-13th; and finally the IV. Corps between July 20th and 30th. The VIII. Corps had meanwhile advanced on Tornado, as we have seen.

On July 3rd Abdul Kerim received orders from Constanti-
nople to advance against the Russians, and set out with the force from Shumla for Rustchuk, immediately preceded by the cavalry division. Still no attempt was made to gain contact with the Russians and discover their intentions. From Rust-
chuk, Abdul Kerim advanced towards the Janta, and after a skirmish between the Turkish cavalry and a Russian cavalry brigade again retired. Realizing Abdul Kerim's incapacity, and rendered anxious by Gurko's successful advance, the authorities at Constantinople now decided to give the command to Mehemet Ali. He superseded Abdul Kerim on July 16th, and reconcentrated the troops between Novi Pazar and Nikopol. Meanwhile, Rifaat Pasha, who had till now been condemned to inactivity at Vidin, received permission to march.

Vidin, with its modern fortifications and heavy armament, and with the Danube on one side and marshy ground towards the interior, was a place of considerable strength. But with the Russians south of the Danube there could no longer be any justification for keeping Osman's 30,000 men isolated. Leaving garrisons in Vidin and the other towns along the Danube from Nikopol to Rakovitza, and to bar the roads from Servia, Osman left Vidin with the remaining 19 battalions, 6 squadrons and 9 batteries on July 13th. His original plan was to join the 10 battalions under Hhair Pasha, then garrisoning Nikopol, and attack the Russian flank between Biela and Tironova; but on July 15th he received news that the Russians were attacking Nikopol, and he then decided to march straight to Plevna, where there was a garrison of 3000 men under Atouf Pasha.

Osman reached Plevna (g.r.) on July 19th, and at once took up a position which had previously been reconnoitred by the Atouf Pasha. It was at the north-east and east of the town. He had arrived just in time.

On July 16th the Russian IX. Corps had taken Nikopol, and on the 18th orders were received to occupy Plevna with one division. At 5 a.m. on July 20th General Schilder-Schulder, with the 5th Division IX. Corps and other forces, attacked Osman's position. No preliminary reconnaissance was made, and the Russians, after an artillery bombardment lasting about an hour, attacked at four points with separate columns. By midday the Russians were in retreat, having lost over 2800 men. There was no pursuit. On July 20th Osman was reinforced by fourteen battalions from Sofia, and the following day sent Rifaat Pasha with six battalions, a battery and some Circassian cavalry to occupy Lovcha in order to secure his communications with Sofia.

Osman's force at Plevna, within three days' march of the one Russian bridge over the Danube and flanking their line of operations, could not be neglected, and General Krüdener, commanding the IX. Corps, received orders to attack again as soon as possible. After the battle of the 20th he had been reinforced by brigades of the IV. and XII. Corps and a cavalry division. With this force, 30,000 in all, he attacked on July 30th. Krüdener advanced in two columns, skobelew, with the cavalry on the southern flank, was subsequently reinforced by infantry, so there were practically three columns of attack.

A general reserve of one brigade was kept at Karagatsch (16 m. east of Plevna). After an artillery engagement which lasted from 8.30 a.m. till 3.30 p.m. the infantry advanced.
Bulgarian troops joining the garrison on the Shipka. Suleiman remained at Veni Zagra till the 13th of August, when he set out for the Shipka. On August 21st the heights east of the pass were taken, and during the next few days there was desperate fighting; but the original garrison was gradually reinforced, and the Russians held on. In this fighting the Russian losses amounted to close on 4000, while the Turkish casualties were about treble that number. Suleiman now intrenched himself close to the Russian position, and there he remained till Sept. 17th, when after a three days' bombardment he again assaulted the position, but was repulsed with considerable loss. This was the last assault made on the Russian position. Suleiman replaced Mehemet Ali as commander-in-chief by an order from Constantinople, Suleiman frittered away his opportunity and his army in a fruitless attempt to retake the Shipka Pass. It was not till the middle of August that Mehemet Ali decided to move against the Russians and ordered an advance. The Czarévich (afterwards Alexander III.), who was opposing him with the XL, XII., and XIII. Corps, in all, 40,000, was posted on the line of the White Lom from Zipgos to Eski Dzuma. On August 22nd and 23rd there were engagements about Ayaslar, resulting in the retirement of the Russians. On August 30th he attacked at Karahassanköy and drove the Russians across the river. On September 3rd he crossed the White Lom and again defeated them at Katzelevo, the enemy retiring behind the Banichta Lom. On September 12th Mehemet Ali continued his advance, but halted on the 14th for a week. He then made an attack on Cerkovna on the 21st, but was repulsed with a loss of 1600 men, and two days later retired his army behind the White Lom. He had effected nothing. As will be seen later, the Russian operations against Plevna had not been in any way disturbed. The containing force under the Czarévich had retired a certain distance, but it still held the main Turkish army. Mehemet Ali's original plan had been to advance by Osman Bazar, effect a junction with Suleiman, and move on Tırnova. But Suleiman was averse to his plan and it was negatived at Constantinople, and though if this plan had been carried out with vigour, the position of the Russians should have been critical. He then advanced on a front of 50 miles, instead of moving concentrated, which is the explanation of his failure. It is true that he was much hampered by the state of his cavalry, which was exhausted, and consequently was without information, while the Russians were well served. Mehemet Ali now concentrated his force, but at this juncture he was superseded by Suleiman Pasha.

To return to Plevna. At this time the Russians were disposed in a semicircle round Plevna, their right or N. flank resting on Ribina and the S. flank resting on Bogt. On August 30th Osman had moved out with a column of all arms towards Pelishat. The following day he engaged the Russians. The Turks lost 300 killed and 1000 wounded, and the Russian losses were about 1000. It is difficult to say what was the object of this sortie, which was of the nature of a reconnaissance in force. It achieved nothing. The Turks were not defeated, but retired again into Plevna the same evening. By the end of August the whole of the Russian army had crossed the Danube, and during the first days of September the first Russian reinforcements, consisting of the 2nd and 3rd infantry divisions and the 3rd Rifle Brigade, had arrived and joined the forces round Plevna. Mehemet Ali's advance and the assaults on the Shipka had been repulsed. The Russians could expect no further reinforcements before October, and it was therefore decided to make a third attempt to take Plevna, but first of all to occupy Lovcha. Skobelov had already made an unsuccessful attempt on August 6th, and General Prince Imeretinski, with a force of two infantry divisions and a brigade of Cossacks, in addition to Lovcha. Skobelov's mixed brigade, was now entrusted with the task. The garrison under Rifaat Pasha amounted to 8 bat- talions, 6 guns and some Circassians. Fighting commenced on Sept. 1st and on the 3rd the Turks were driven out, most of the survivors finding their way to Plevna, and bringing 5 guns with them. The Russians lost 1500, the Turks 2500. On Sept. 2nd, Osman set out with a strong relieving column from Plevna, but on the 4th, hearing that the Russians had already occupied the town, he turned back and reached Plevna on the 6th. On Sept. 5th, 8 battalions and 2 batteries reached Orkhane, and Osman's force, including the Lovcha troops, numbered about 30,000 men and 72 guns. The Russian forces, including the Rumanians, numbered about 90,000. Their plan was, after a long artillery bombardment, to attack the eastern front with the Russian forces, the south-eastern front with the IV. and IX. Corps and the southern front with Imeretinski's command. The attacks were to be simultaneous. The cavalry divisions were to be kept in rear and close to the flank of the attacking infantry. During the night of Sept. 6th/7th the troops were moved into preparatory position, and batteries were constructed at 3000 to 5000 yds. from the outer works. The artillery bombardment commenced at 6 a.m. on Sept. 7th and continued till midday Sept. 11th. So far the infantry had only been engaged on the south flank, where Skobelov had succeeded in capturing Imeretinski in the command. He had succeeded in advancing to within 2000 yds. of the southern Turkish redoubts and had entrenched himself. The orders for Sept. 11th were for the infantry assaults to be delivered at 3 p.m. after a six hours' cannonade. A dense fog interfered with the artillery bombardment. At the end of the day the Rumanians had taken No. 1 Grivitza redoubt, the attack on the S.E. front had been repulsed and Skobelov had established himself within 1000 yds. of Plevna, having taken Kavanlik and Issa forts. On Sept. 12th the Turks retook these forts and drove Skobelov back. During the next two days the Russians continued to bombard the works, but no further attack was made. The Rumanians remained in possession of the Grivitza redoubt, defeating an attempt made by the Turks to retake it on Sept. 14th. The Russians then decided to retire and entrenched themselves on a line with Verbitza-Kadišchevo, with their cavalry extending to the Vid on either flank. There was no question of pursuit; in the first and second battles the numbers had been about equal, but now the Russians were vastly superior and Osman would have been crushed by a powerful counter-attack. In their third battle the Turks had lost 5000, while the Russian casualties amounted to close on 20,000. The Russian bombardment, lasting four days, had effected nothing. It had not caused 200 casualties. The object of the artillery is to cover the advance of the infantry, and the arms must work in combination. The defender does not expose himself to the artillery fire unless compelled to do so by the approaching infantry. The Russians failed to realize this and practically wasted their ammunition. They had again failed to recon- noise the position and attacked along the whole front instead of pressing home in strength at the decisive points. Their attacks were not even simultaneous, and Osman was able to shift his reserves from point to point. In addition to this, when the Russians retired one-third of their force had not been engaged. The defects in their plan of action are largely attributable to the fact that though control was nominally centred in one man, senior officers were present who interfered with his arrangements.

It was now decided to complete the investment of Plevna, and Todleben, the defender of Sevastopol, was entrusted with supreme control of the operations. He arrived on the scene on Sept. 28th, but it was not till Oct. 24th that the investment was completed, and, meanwhile, on Sept. 24th and again on Oct. 8th, strong reinforce- ments arrived, raising the Turkish force under Osman to 84 battalions, 25 squadrons and 96 guns, with an effective of 48,000 men. Plevna had been re-victualled and the sick and wounded had been sent back to Orchanje. General Krilov, who had been operating west of the Vid, with 52 squadrons and 30 horse artillery guns, had failed to prevent these movements, and was superseded by General Gurko on Oct. 8th. The Russian
Guards Corps had all reached Plevna by Oct. 20th, and two divisions were at once placed under Gurko’s orders, raising his command to 35,000 infantry, 10,000 cavalry and 48 guns. His instructions were to capture the Turkish positions along the Sofia road. He compelled the garrison of Dolni-Dubnik to retire into Plevna, and captured Gorni Dubnik and Telis with their garrisons after severe fighting on Oct. 24th and 28th. Osman’s force was thereby reduced by 12 battalions. About the middle of November the opposing forces were distributed as follows: 6 divisions along the Lom, under the Cesarевич, facing Suleiman’s army; 3 divisions holding the Shpika under Radetzky; 1 division at Lovča; 2½ divisions west of the Vid under Gurko; and 12 divisions east of the Vid, investing Plevna. The XIV. Corps was in the Dobrudja, the VII. Corps about Odessa and the X. Corps in the Crimea.

On the Turkish side Suleiman advanced across the Lom, leaving small garrisons in the fortresses, and attacked at Meckha on Nov. 19th, and at Meckha and Tristenik on Nov. 20th, and again on Dec. 12th, but each time without success, and he retired across the Lom. South of the Balkans Vessil Pasha had succeeded Reouf Pasha on the Shpika. He continued to hold the three Russian divisions there, but made no attempt to dislodge them, beyond small offensive demonstrations made with the object of concealing the departure of large drafts which were sent to Sofia.

At Sofia and Orkhanie, the Turks were forming an army of recruits and reservists with the object of advancing to the relief of Osman. Mehmet Ali was entrusted with the command. Osman had already asked the sultan’s permission to evacuate Plevna, with a view to co-operating with Mehmet Ali, but permission was refused. It was not till the investment was completed that the sultan changed his mind, too late, and gave his sanction to the move. The Russians received information of Mehmet Ali’s intended advance, and as the force round Plevna amounted to 191 battalions, 120 squadrons and 650 guns, it was decided that Gurko should move with his detachment towards Sofia. He concentrated his force at Yablonitz on Nov. 28th and succeeded in driving the Turkish advanced guard from Orkhanie. Mehmet Ali now occupied a strong position covering the Arabi Konak Pass over the Balkans, and, with a force of 43 battalions with cavalry and guns, made no attempt to relieve Osman.

Osman Pasha, his supplies having given out, eventually decided on a sortie. His troops had been short of food since the beginning of November, and the number of sick had risen to 10,000. His plan was to break through to the west and make for Sofia via Berkovitz. The Russians observed the preparations made and concentrated sufficient force at the threatened point, with the result that Osman and his army of 40,000 men capitulated. The Turkish losses in the action were about 6000 and the Russians lost about 1300. The Russians now decided, notwithstanding the Turkish intention to push on across the Balkans. The VII. and X. Corps were still left guarding the Russian coasts. The Cesarевич was left north of the Balkans with 71,000 men to guard the communications. Gurko’s force was raised to 80,000. Leaving a containing force to oppose the Turks at the Arabi Konak Pass positions, he crossed by the Curia Pass. The Turks retired unobserved, and after a feeble stand at Tashkosen retreated to Kustendil. Gurko occupied Sofia on Jan. 4th. Radetzky’s force at the Shpika was raised to 66,000, with which force, having defeated Vessil Pasha, he was to join Gurko south of the Balkans. Radetzky commenced operations on Jan. 5th. Keeping one division to hold the works on the Shpika, he moved the remainder of the force in two columns under Skobelev and Prince Mirski, who were to cross one on each side and attack simultaneously from the south. Vessil Pasha held an entrenched camp at Sheno with some 12,000 men; the remainder of his force was in position on the mountains. Owing to the difficulties of the crossing, Skobelev was delayed. Mirski attacked on Jan. 8th and was repulsed. The following day Skobelev and Mirski attacking together were successful, and Vessil Pasha capitulated with his force, some 36,000, of whom 6000 were sick and wounded. Vessil Pasha had pointed out the danger of his position on Jan. 27th, but, contrary to Suleiman’s advice, the war minister, believing an armistice imminent, had ordered him to hold on to the Shpika Pass. Mehmet Ali’s force, dangerously delayed owing to interference by the minister of war, eventually reached Tatar-Bazardjik, which was selected by Suleiman (now commander-in-chief) for the concentration of his forces. Having received news of the capture of the Shpika force he retired on Philippopoli, with Gurko’s forces closely pursuing. But Radetzky’s forces had already pushed on and practically cut Suleiman off from Adrianople. After some engagements about Philippopoli on Jan. 15th, 16th and 17th, he retreated towards the Aegean Sea through the Rhodope mountains, having lost most of his guns, and reached Enos about Jan. 28th, whence what remained of his force was conveyed by water to Constantinople.

Suleiman had again missed his opportunity. The Russians crossed the Balkans in a wide front of about 180 miles, and there was opportunity for successful action by a capable commander. There were not only the columns commanded by Gurko and Radetzky, but also a third column under General Kurtzoff, which crossed by the Trojan Pass, after which it joined Gurko’s force. There were the troops under Mehmet Ali about Sofia, Vessil Pasha’s force about the Shpika, and the main army on the Lom, which had been withdrawn south of the Balkans after the fall of Plevna, so that Suleiman, who had been appointed commander-in-chief, had an available force of 150 battalions, 120 guns and a proportion of cavalry. The fortified town of Adrianople offered a strong central position at which to concentrate his forces, and with this point as a support, acting on interior lines, he could have dealt with the invading and widely separated columns in detail. But he missed his opportunity and left his scattered forces to be overpowered by superior numbers in each instance. That minister for war was undoubtedly responsible to a great extent for this faulty strategy, but the blame falls on the head of Suleiman as commander-in-chief. There was no object in leaving Vessil Pasha on the Shpika. All available forces should have been concentrated in a sound strategical situation.

The Servians had crossed the frontier after the fall of Plevna, and the Montenegrins were also pressing on. On Jan. 16th the Russians occupied Adrianople, and on Jan. 30th they were facing the Buyuk Tchemedji lines, with their flanks resting on the Black Sea and the Sea of Marmora. Mehmet Ali was in command of what remained of the Turkish armies behind the lines. On Jan. 31st an armistice was arranged, and on March 3rd the treaty of San Stefano was signed, the terms of which were modified later at the Berlin Conference in June and July 1878.
there had been no decisive battles. The Turks had been defeated owing to the incapacity of their leaders, none of whom had previously commanded an army organized according to modern ideas. They were ignorant of strategic principles. Then, again, the interference with the generals in the field by the authorities at Constantiopolis had in each case resulted in the disasters which invariably follow the attempt of civilian amateurs to control warlike operations.

On the Russian side, the enemy had been at first despaired, and consequently the forces originally employed were inadequate, which meant subsequent delays, losses and expense. The command of the sea had proved of little value to the Turks. Their flotilla rendered them no assistance. In the early stages it could have materially assisted by landing reconnitring parties N. of the Danube, and by interfering with the Russians when crossing the river. The Russian bridge offered a tempting objective throughout the campaign, but commanders with the requisite dash and initiative were not forthcoming. The defeat of the Turks was due in the first place to the failure of their politicians to ensure the adequate organization and training of the army during peace time, in the second place to the want of a commander who had educated himself to undertake the responsibilities entrusted to him.

A separate campaign had been waged, as before, in Asia Minor. Here the Turks under Mukhtar Pasha had 57,000 men in two corps, the one on the side of Batoum and Ardahan, the other between Erzerum and Kars. His opponent, Loris Melikov, had at first only somewhat a disorganized number of Cossack Satins. The Russians advanced in three weak columns. On the 17th of May after bombardment the right column stormed Ardahan. The right and centre columns then closed inwards upon Kars, which they besiegged, but the siege was given up in July, v. of the Mukhtar, advancing to its relief with 35,000 men, had repulsed Melikov's attack at Zivin (June 26th). The left column occupied Bayazid without difficulty, but when it had proceeded thence on the Erzerum road it was driven back and the column retraced its steps to relieve the place. After this it halted at Igdir in the Araxes valley. Meanwhile the Turks on the coast had advanced, in concert with their fleet, and raised an army of the Mohammedans of the littoral. They were eventually repulsed, but the insurrection was not completely suppressed until the summer of 1875.

In August Mukhtar, who had followed up Melikov's retreat from Kars, and won the victory of Kizil-Tepa, led 30,000 men in front of this position, and behind them the Kars garrison of 10,000. Ismail on the Bayazid side had 40,000; Dervish, at Baroum 17,000. But after an interval of two months Melikov was reinforced, while drafts for the Neapolitan army were taken from (muskets) from Mukhtar, v. of the Michael, assuming command of the Russians, defeated his opponent completely in the battle of the Aladja Dagh (Oct. 15th). The remnants of Mukhtar's army retreated on Erzerum, and while pursuing them the Russian garrison was biladed, and the column retraced its steps to relieve the place. After this it halted at Igdir in the Araxes valley. Meanwhile the Turks on the coast had advanced, in concert with their fleet, and raised an army of the Mohammedans of the littoral. They were eventually repulsed, but the insurrection was not completely suppressed until the summer of 1875.

RUST (O.E. ríst, a word which appears in many Teutonic languages, c.f. Du. roest, Ger. rost); in origin it is allied with "ruddy" and "red," the reddish-brown powdery substance which forms on the surface of iron or steel exposed to atmospheric corrosion. Formerly the process was regarded as oxidation pure and simple, and, although it was known that iron did not rust in dry air, yet no attempt was made to explain why water was necessary to the action. F. Crace-Calvert in 1871 showed that the carbon dioxide of the atmosphere was a factor; and in 1888 Crum Brown published the theory—termed the "carbonic acid theory"—that water and carbon dioxide react with iron to form ferrous carbonate and hydrogen, the ferrous carbonate being subsequently oxidized by moist oxygen to lepidocrocite and regenerating carbon dioxide, which again reacts with more iron. The theory was converted by Wyndham Dunstan, who attempted to prove that carbon dioxide was not necessary to rusting; and in place of the acid theory, he set up a scheme which involved the production of hydrogen peroxide. G. T. Moody has since shown that when all traces of carbon dioxide are removed (which is a matter of great experimental difficulty) iron may be left in contact with oxygen and water for long periods without rust appearing, but on the admission of carbon dioxide specks are rapidly formed. It also appears that rust changes in composition on exposure to the atmosphere, both the ferrous oxide and carbonate being in part oxidized to ferric oxide. Acids, other than carbonic, may promote rusting; this is particularly the case with ironwork exposed to the acids—sulphurous, nitric, &c.—contained in smoke. It is probable that the action depends upon the presence of iron, oxygen and water, and some acid which makes the water an electrolyte.

Steel differs in many ways from iron in respect of atmospheric corrosion; the heterogeneous nature of steel gives occasion to a selective rusting, ferrite is much more readily attacked than the cementite and pearlite; moreover, the introduction of other elements may retard rusting; this is particularly the case with the nickel-steels.

RUSCHUK (Bulg. Rushe), the capital of the department of Ruschuk, Bulgaria, on the right bank of the Danube, where it receives the E. Lom. Pop. (1906) 35,552. Ruschuk is the headquarters of a military division and of a naval flotilla stationed on the Danube. As a river-port and the terminus of railways from Varna and from Sofia via Trinovo, it has much commercial importance; and it possesses tobacco and cigarette factories, soap-works, breweries, aerated water factories, dyeworks, tanneries, sawmills, brick and tile works and a celebrated pottery.

In the time of the Romans Ruschuk was one of the fortified points along the line of the Danube. In the Tabula Peutingeriana it appears as Prisca, in the Antonine Itinerary as Seraph, in the Notitia as Serapapistra and in Ptolomy as Priste Polis. Destroyed by barbarian invaders in the 7th century the town recovered its importance only in comparatively modern times. In 1850 it was captured by the Russians, who held it for the next 20 years.

It played an important part in the Russo-Turkish Wars of 1828-29, 1853-54 and 1877-78. In 1877 it was nearly destroyed by the Russian artillery stationed in the Rumanian town of Giurgeo, on the opposite bank of the Danube.

RUSTENBURG, a district and town of the Transvaal, South Africa. The district originally included all the N.W. part of the country, but is now of much smaller dimensions. Its S. border is marked by the Magaliesberg and other hills forming the N. escarpment of the high veld and the watershed between the Vaal and Limpopo. Several of the headstreams of the Limpopo rise within the district on the N. slopes of the Magaliesberg. The climate of the district is sub-tropical and the principal cultivation is that of tobacco, and fruit trees, notably oranges. The opening of the railway to Pretoria in 1896 led to a marked development of trade. In an amphitheatre bounded by the hills and 61 m. by rail W. of Pretoria is the town of Rustenburg, with a population (1914) of 18,715. The town is one of the oldest in the Transvaal, having been founded in 1850 by the Voorreigers. It was at Rustenburg that the volksraad met in March 1852 to ratify the Sand River Convention granting independence to the Transvaal Boers. At the time it was feared that there would be civil war between Hendrik Potgieter and Andries Pretorius, but they were reconciled in Potgieter's tent. Later Rustenburg became the home of the Kruger family. It was occupied by the British under R. S. Baden Powell in June 1900.

RUSTICATION (i.e. the making "rustic" or countrified, from Lat. rust, country; thus the term "rusticate" is used for taking a country holiday, or in academic circles to be "rusticated" is to be sent away from a university for punishment), in architecture, the technical term (French equivalent bâchage) given to masonry in which the centre part of the face of the stone is either left rough as it comes, or brought by the Dutch in various ways to give variety to the surface. The earliest example exists in the platform at Pasargadae in Persia (560 B.C.), erected by Cyrus, where the edge round the four sides of the stone forms a draft, two or three inches wide, worked with a chisel, the centre
part being left rough. Similar work exists at Arak-el-Emir in Palestine (111 B.C.). The finest examples are those of the walls of the temple at Jerusalem, and at Hebron, where the stones are of immense size and the rustication projects sometimes over a foot. The Crusaders' castles in Palestine are all boldly rusticated, but the projecting portions have been worked over with a chisel in diagonal lines, and this enables them to be distinguished from the earlier masonry. In the five-sided tower at Nuremberg and the Burg-Capelle at Rothenburg, the rustication has a decorative value, so that in later work it was employed for the quoin-stones of towers. The masonry of the Palazzo Vecchio, and of the Piti, Strozzi and Riccardi palaces, all in Florence, and of other palaces in Siena and Volterra, is rusticated. Rustication was employed in terraces and grottos in Italy, where on account of its extravagances it gave rise to the term "gothic." In the later Renaissance the edges of the stone were bevelled off, with a sunk joint in addition; and the treatment was known as vermiculated, if in imitation of earth burrowed by worms; marine, if with small shell holes; stalactitic, if carved in imitation of lime deposits. In Italy the projecting portions were sometimes worked into facets. Rustication was introduced into England by Inigo Jones, who, in old Somerset House, York Stairs Watergate, the gateway of the Botanical Garden at Oxford, and elsewhere, used it only in alternate courses, his example being followed by other architects of the Renaissance. The term is now applied to the ashlar blocks of masonry which alternate with the circular drums of columns in many public buildings.

RÜSTOW, FRIEDRICH WILHELM (1821-1878), Swiss soldier and military writer, was a Prussian by birth. He entered the service of his native country, and served for some years, until the publication of Der Deutsche Militärstaat und während der Revolution (Zürich, 1850) brought him official condemnation. He was sentenced by a court-martial to a long term of imprisonment, but succeeded in escaping to Switzerland. He obtained military employment in the service of the Republic, and in 1857 was major on the engineer staff. Three years later he accompanied Garibaldi in the famous expedition against the two Sicilies as colonel and chief of the staff, and to him must be ascribed the victories of Capua (19th Sept. 1860) and the Volturno (1st Oct. 1860). At the end of the campaign he once more settled down at Zürich. At the outbreak of the war of 1870 he offered his services to Prussia, but was not accepted. In 1878, on the foundation of a military professorship at Zürich, Rüstow applied for the post, and, on its being given to another officer, lost heart and committed suicide.

Two younger brothers, both Prussian soldiers, were also distinguished men. The elder, Alexander (1824-1886), is remembered for his work Der Kästnerkrieg (Berlin, 1848); the younger, Caesar (1826-1886), was one of the foremost experts of his time in the design and construction of military rifles, and the writer of several treatises on that subject, of which we may mention Die Kriegskanonenwaffen (Berlin, 1857-64). Both Alexander and Caesar fell on the field of battle in 1866, at Königrätz and Dornbach respectively.

RÜTEBEUF, or Rutebeuf (fl. 1245-1285), French trouvère, was born in the first half of the 13th century. His name is nowhere mentioned by his contemporaries. He frequently plays in his verse on the word Rutebeuf, which was probably a nom de guerre, and is variously explained by him as derived from rude bâuf and rude œvre. He was evidently of humble birth, and he was a Parisian by education and residence. Paulin Paris thought that he began life in the lowest rank of the minstrel profession as a jongleur. Some of his poems have autobiographical value. In Le Mariage de Rutebeuf he says that on the 2nd of January 1261 he married a woman old and ugly, with neither dowry nor amiability. In the Complainte de Rutebeuf he details a series of misfortunes which have reduced him to abject destitution. In these circumstances he addresses himself to Alphonse, comte de Poitiers, brother of Louis IX., for relief. Other poems in the same vein reveal that his own miserable circumstances were chiefly due to a love of play, particularly a game played with dice, which was known as grisiche. It would seem that his distress could not be due to lack of patrons, for his metrical life of Saint Elizabeth of Hungary was written by request of Erard de Valéry, who wished to present it to Isabel, queen of Navarre; and he wrote elegies on the deaths of Anseau de l'Isle Adam, the third of the name, who died about 1251, Eude, comte de Nevers (d. 1267), Thibaut V. of Navarre (d. 1270), and Alphonse, comte de Poitiers (d. 1271), which were probably paid for by the families of the personages celebrated. In the Pauvreté de Rutebeuf he addresses Louis IX. himself.

The piece which is most obviously intended for popular recitation is the Dit de l'herbe, a dramatic monologue in prose and verse supposed to be delivered by a quack doctor. Rutebeuf was also a master in the verse conte, and the five of his fabliaux that have come down to us are gay and amusing. The matter, it may be added, is sufficiently gross. The adventures of Frère Denise le cordelier, and of "la dame qui alla trois fois autour du moullet," find a place in the Cent Nouvelles nouvelles. 

Rutebeuf's serious work as a satirist probably dates from about 1260. His chief topics are the iniquities of the friars, and the defence of the secular clergy of the university of Paris against their encroachments; and he delivered a series of eloquent and insistent poems (1262, 1263, 1268, 1274) exhorting princes and people to take part in the crusades. He was a redoubtable champion of the university of Paris in its quarrel with the religious orders who were supported by Pope Alexander IV., and he boldly defended Guillaume de Saint-Amour when he was driven into exile. The libels, indecent songs and rhymes condemned by the pope to be burnt together with the Périls des derniers temps attributed to Saint-Amour, were probably the work of Rutebeuf. The satire of Reraii le Bestourdé, which borrows from the Reynard cycle little but the names under which the characters are disguised, was directed, according to Paulin Paris, against Philip the Bold. To his later years belong his religious poems, and also the Voie de Rutebeuf, the description of a dream, in the manner of the Roman de la Rose.

The best work of Rutebeuf is to be found in his satires and verse conies. A miracle play of his, Le Miracle de Théophile, is one of the earliest dramatic pieces extant in French. The subject of Theophilus, the Clician monk who made a pact with the devil, which was afterwards returned to him by the intervention of the Virgin, was a familiar one with the story-tellers of the middle ages. Rutebeuf can claim no priority in the choice of the subject, which had been treated dramatically in the Latin piece ascribed to the nun Hroswitha of Gandersheim, but his piece has considerable importance in dramatic history. The Œuvres de Rutebeuf were edited by Achille Jubinal in 1839 (new edition, 1874); a more critical edition is by Dr Adolf Kressner.

1 It has been suggested that Brunetto Latini was thinking of Rutebeuf when he wrote in his Livre du Trésor: "Le Rire, le jeu, voilà la vie du jongleur, qui se moque de lui-même, de sa femme, de ses enfants, de tout le monde."
RUTH, BOOK OF

RUTH, BOOK OF, in the Old Testament. The story of Ruth (the Moabitess, great-grandmother of David) is one of the Old Testament Hagiographa and is usually reckoned as the second of the five Megilloth (Festal Rolls). This position corresponds to the Jewish practice of reading the book at the feast of Pentecost; Spanish MSS., however, place it at the head of the Megilloth; and the Talmud (Baba Bathra, 14b) gives it the first place among all the Hagiographa. On the other hand, it follows Judges in the Septuagint, the Vulgate and the English version. But although it was very natural that a later rearrangement should transfer Ruth from the Hagiographa to the historical books, and place it between Judges and Samuel, no motive can be suggested for the opposite change, and the presumption is that it found a place in the last part of the Jewish canon after the second (with the historical books) had been definitely closed. See Bible: Old Testament, section L "Canons": CANTICLES; LAMENTATIONS.

That the book of Ruth did not originally form part of the series of "Former Prophets" (Joshua-Kings) is further probable from the fact that it is quite untouched by the process of "prophetic" or "Deuteronomistic" editing, which helped to give form to these other books. Ruth could have no affinity with the point of view which looks on the history of Israel as a series of examples of divine justice and mercy in the successive rebellions and repentances of the people of God. But if the book had been known at the time when the history from Joshua to Kings was edited it could hardly have been excluded from the collection; the ancestry of David (iv. 17, 18-22) was of greater interest than that of Saul, which is given in i Sam. ix. 1, whereas the old history names no ancestor of David beyond his father Jesse. In truth the book of Ruth presents itself as dealing with times far back (Ruth i. 1) and takes delight in depicting details of antique life and obsolete usages (iv. 7); it views the stormy period before the institution of the kingship through the softening atmosphere of time, which imparted to the scene a gentleness very different from the harsher colours of the old narratives of the book of Judges. It has indeed been argued that, as the author seems to take no offence at the marriage of Israelites with Moabit women, he must have lived before the time of Ezra and Nehemiah (Ezra ix.; Neh. xii.); but the same argument would prove that Ruth had no affinity with the point of view which looks on the history of Israel as a series of examples of divine justice and mercy in the successive rebellions and repentances of the people of God. It is true that the language has some features which appear to link it with the narratives in Samuel and Kings, but it might fairly be assumed either that the book is the work of a late author well acquainted with the earlier literature, or that an old narrative had undergone some rewriting at a later age. No definite conclusion can be drawn from the fact that the language stands in marked contrast to that of Chronicles, Ezra, Nehemiah, etc., since writings presumably more or less contemporary did not necessarily share the same characteristics (observe, for example, the prose parts of Job).

Like the stories appended to Judges (by a post-Deuteronomistic hand) the book of Ruth connects itself with Bethlehem, the traditional birthplace of David. Some connexion between Bethlehem and Moab has been found in the (now corrupt) text of 1 Chron. iv. 22 (where the Targum and late rabbinical exegesis discover references to the story of Ruth), and is more explicitly suggested by the isolated Sayings xi.; see i Sam. xxii. 3, seq. which evidently knew of some relationship between Moab and the illustrious descendant of Boaz and Ruth. Next, the writer claims the sympathy of his readers.

1 The religious pragmatism lacking in the original is in part supplied by the Targum (i. 6, 6).

for Ruth, upon whose Moabite origin he frequently insists, and this feature is noteworthy in view of the aversion with which intermarriage was regarded at a certain period (Deut. xxii. 2, 3; Neh. xiii.; Ezra ix. seq.). The independent evidence for the present post-exilic form of the book has consequently led many scholars to the conclusion that it was directed against the drastic steps associated with the reforms of Ezra and Nehemiah, which, as is known, were not everywhere acceptable. Thus, not only do we have a beautiful portrait of a woman of Moabitian origin, but she becomes the ancestress of David himself, and in the days of these measures the charming and simple story would inevitably suggest the question whether the exclusiveness of Judaism could not be carried too far. There is no reason, however, to believe that this was the original object of the story. It contains other features of considerable interest to which more importance seems to be attached, and the writer is evidently an artist who takes manifest delight in the touching and graceful details of his picture, and is not simply guided by a desire to impart historical information or to enforce some particular lesson.

One does not look for absolute consistency in oriental narratives, and even this little book contains several internal intricacies which demand investigation. The genealogy from Perez to David in iv. 18-22 is of little value since Salma (Salmon), father of Boaz, is a Calebite clan, his name being assumed by one of the tribes of Hebron as in Judges i. 1 Sam. xxxv. &c., for "father" of Bethlehem, representing exile or later conditions (1 Chron. ii. 51; see Caleb). Apart from other signs of a late date in this list of the ancestors and descendants of Boaz, iv. 12 certainly implies that the genealogical lines of Perez and Boaz were not identical, and thus verses 18-22 in the opinion of most scholars are a later addition.

Further, the story involves points of old family usage which are no longer clear. The well-known custom which gives the nearest heir of the dead a right to inherit the widow is naturally distinct from the levirate (q.v.), where it is the brother's duty to marry his widowed sister-in-law if childless, and where the eldest son succeeds to the name and inheritance of the deceased. In Hebrew usage the refusal to perform the levirate brought ignominy (see Deut. xv. 5-10), and Gen. xxxviii. relates how Tamar, when Shelah was not given to her, obtained a child through her father-in-law Judah (see esp. vers. 14, 26). In addition to these customs to prevent the alienation of the estate and to perpetuate the family name, the post-exilic story in Num. xxvii. 1-11, xxxvi. gives daughter's right to inherit the estate of her widowed father. Although the levirate still continued (Matt. xxi. 24 sqq.), the late laws in Lev. xviii. 16, xx. 21, as also this story, may be aimed against it. Finally, the gēd ("next kinsman", lit. "avenger"; see Driver, Encyc. Bib. col. 1745 sqq.) has the first right of purchase to an estate (Jer. xxxiii. 6-12), and indeed must redeem the property which his needy relative might be compelled to sell (Lev. xxv., see ver. 25). Now it appears that Boaz combines the essential duty of the gēd in purchasing the estate over which Naomi holds rights, and at the same time marries, not Naomi, who is now old, but her daughter-in-law Ruth, in order to perpetuate her husband's family. Naomi, who had realized the impossibility of the levirate in her case (i. 11 seq.), returned home a disconsolate and childless widow (i. 20 seq.), but the filial Ruth fell in with her plans and put herself entirely into the hands of the kinsman Boaz (iii.). In the happy finale, Naomi is the recipient of congratulations upon the birth of a son to the faithful Ruth (iv. 17a, "there is a son born to Naomi"); the name of the dead is thus "raised up" (iv. 5, 10), and the child Obed is clearly recognized as the fruit of the levirate (see further ibid.), since it is the son of his mother's brother (see Smith, Encyc. Bib. col. 5196 head), and ver. 12 to the story of Tamar and Judah. Compare, for the retention of simple methods of transacting business, the striking of hands (Prov. vi. 1, xxii. 26).
as of the line of Elimelech and Mahlon (Naomi’s husband and son). In point of fact, a nearer kinsman than Boaz had agreed to purchase the estate (as gūlōh, which Naomi evidently had not yet sold (see commentaries on iv. 3), but he was unwilling to marry Ruth (reading in ver. 5, “and also Ruth thou must buy”); cf. ver. 10), recognizing that if a son were born the estate would revert to the line of Elimelech, thus leaving him at a disadvantage. He was evidently unprepared for what seems a novel condition (contrast Boaz in iii. 12 seq.), although, from the felicitations in iv. 11–13, the issue of the marriage is actually reckoned to the husband (Boaz). It is improbable that these conflicting features in v. 11–13 and ver. 17a, and all that they involve, co-existed, and it is possible that the former (with the implied reference to the coming David) is not part of the original. However, as in the equally complicated story in Gen. xxviii., it is difficult to trace the extent or growth of the various motives, e.g. the primary interest in Naomi, the romantic marriage of Ruth, the selling of the land (which comes only in ch. iv.), &c.

RUTHENIANS, a name applied to those of the Little Russians who are Austrian subjects. The name is a form of the word Russian. The Ruthenians were separated from the bulk of Russians by the accident of the two feudal principalities of the old Red Russia, Halicz and Volynia, having fallen to Lithuania, which in turn was united with Poland. At the partition of Poland no one troubled about ethnological boundaries. The language is in substance like the Little Russian of the Ukraine, though it has marked differences; the most interesting dialects are those in the extreme W., which approach to Slovak and that of the Huzuli in Bukovina. The Ruthenians number some three million in Galicia, Bukovina, and in the Carpathians along the edges of Hungary from the 21st meridian eastwards. Throughout Poland the Poles form the aristocracy, though in two-thirds of it Ruthenians compose the bulk of the population, while the middle class is Jewish or German. The Ruthenians are therefore under an alien yoke both politically and economically: in religion they mostly belong to the Uniate Church, acknowledging the Pope but retaining their Slavonic liturgy and most of the outward forms of the Greek Church. Their intellectual centre is Lemberg (Lviv or Lwów), where some lectures in the university are given in their language, and they are agitating for it to have equal rights with Polish. Yet here Little Russian is freer than in the Russian empire, and in Lemberg is the centre of its literature, the society called by the name of Ševčenko, the Little Russian poet. This society publishes voluminous transactions in a special orthography and deals with everything concerning Little Russia, its archaeology, people and language.

See summary of the work of the Ševčenko for ten years in Archiv f. d. lit. Polen (1897–1906). RUTHENIUM [symbol Ru, atomic weight 101.7 (O = 16)], in chemistry, a metallic element, found associated with platinum, in platinum ore and in osmiridium. The metal may be obtained from the residues obtained in the separation of osmiridium from osmiridium. These are washed with ammonium chloride until the filtrate is colourless, ignited, fused with caustic potash and nitre, the melt dissolved in water and nitric acid added to the solution until the colour of potassium ruthenate disappears. A precipitate of ruthenate oxide gradually separates; this is collected and ignited in a graphite crucible and finally fused in the oxyhydrogen furnace (H. Sainte-Claire Deville and H. J. Debray, Ann. chim. phys., 1859, (3), 56, p. 406). For other methods see C. E. Claus, Pogg. Ann., 1845, 65, p. 200; E. Fröb (Comptes rendus, 1854, 38, p. 1008; T. Wilim, Ber., 1883, 16, p. 529). Ruthenium is obtained by A. Guthier and L. Trenkner (Zeit. anorg. Chem., 1905, 45, p. 166) by heating the crude metal (obtained by other methods) in a current of oxygen until all the osmium is volatilized as tetroxide. The residue is then fused with caustic potash and nitre, dissolved in water, saturated with chloride and distilled on the water-bath in a current of chlorine. Pure ruthenium tetroxide distils over. This is then dissolved in water, reduced by alcohol and ignited in oxygen. Ruthenium in bulk resembles platinum in its general appearance, and has been obtained crystalline by heating an alloy of ruthenium and tin in a current of hydrochloric acid gas. Its specific gravity (after fusion) is 12.063 (A. Joly, Comptes rendus, 1893, 116, p. 430). It fuses easily in the electric arc. It oxidizes superficially when heated, but fairly rapidly when ignited in an oxidizing blowpipe flame, forming a black smoke of the oxide. It is also oxidized when fused with caustic potash and nitre, forming a ruthenate. Acids have practically no action on the metal, but it is soluble in solutions of the alkaline hypochlorites. Like most of the other metals of the group, it absorbs gases. A colloidal form has been obtained by A. Guthier and G. Hofmeier (Jour. prakt. Chem., 1905, 2, 71, p. 452) by reducing ruthenium salts with hydrazine hydrate in the presence of gum-arabic.

Several oxides of ruthenium have been described, the definite existence of some of which appears to be doubtful. The dioxide, RuO₂ (formerly known as ruthenate), is obtained by treating the metal with hydrochloric acid in a current of oxygen. It crystallizes in octahedra isomorphous with stannic oxide. It is insoluble in acids and decomposes when heated to a sufficiently high temperature. Fusion with caustic potash converts it into a yellow crystalline ruthenate and ruthenium sesquisulfide, Ru₂S₃, which is a black, metallic, insoluble powder. An oxide of composition Ru₃O₅ is obtained as a black hydrated powder when the peroxide is heated with water for some time. It becomes anhydrous about 360° C., and is unattacked by acids and alkalis. The peroxide, RuO₂, is formed by heating the solution of potassium ruthenate decomposed by chlorite, or by oxidizing ruthenium compounds with potassium chlorate, hydrochloric acid, or with potassium permanganate and sulphuric acid. It forms a mixture with water of ruthensulphate, which slowly in vacuo, and melts at 25°–25°C. It blackens on exposure to moisture, and decomposes when exposed to light. It is insoluble in water, but gradually decomposes, forming a hydrated oxide, RuO₂·H₂O. The dioxide, Ru₂O₃, is a black, crystalline, amorphous substance with a characteristic smell, somewhat resembling that of ozone. Ruthenium dichloride, RuCl₂, is obtained (in solution) by reducing the sesquisulphide by sulphurised hydroxide or zinc. It is stable in the cold. When heated with a mixture of carbon and charcoal it is passed over a flame and the ruthenium heated to 350° C. (Joly, Comptes rendus, 1892, 114, p. 291). It is a brown powder which readily decomposed by a mixture of carbon monoxide and a mixture of carbon monoxide readily, forming RuCl₂·2NH₄Cl. Numerous double chlorides, A ruthenium chloride, RuCl₂·4NH₄Cl·4KCl, etc. The pure tetrachloride, RuCl₄, has not been isolated, but is chiefly known in the form of its double salts, Ru₂Cl₆·NH₄Cl, or potassium ruthenate, K₂Ru₂Cl₆, which is obtained when finely divided ruthenium is ignited with potassium chloride and potassium chlorate is gradually added to the fused mass (U. Antony and A. Luches, Gaz. 1896, 99, II, p. 82). It is a red-brown crystalline powder, which is soluble in water. A similar ammonium salt of ruthenium tetraethyl is obtained when potassium ruthenate is boiled with a solution of potassium cyanide, K₂Ru₂(C₂H₃O₂)₆Cl₂, and the metal is warmed with pyrites and some borax, and the fused mass treated with hydrochloric acid first in the cold and then hot. The insoluble residue contains a mixture of two sulphides, one of which contains ruthenium, the other of iron, whilst the other (a crystalline solid) is insoluble in acids. Ruthenium sulphate, Ru₂(SO₄)₃, when obtained by oxidizing the sulphide, is an orange-yellow mass which is deliquescent and dissolves in water, thereby forming a strongly acid reaction. Rue de Ruthene, RuOH(CH₂)₂(OH)(NH₂)₂, is ruthenium sesquisulphide at 40°C, the product being purified by crystallization from ammonia. It forms small brown lamellae which dissolve slowly in water to give a fuchsin-red solution possessing a violet reflex. The solution possesses a considerable titrator power, dyeing silk in the cold. Potassium ruthenate cyanide, K₂Ru(C₂H₃O₂)₃H₂O, formed when potassium ruthenate is boiled with a solution of potassium cyanide, crystallizes in colourless plates which melt with decomposition at 326° C. Ruthenium has been prepared by H. Moissan (Comptes rendus, 1893, 137, p. 229) by the
direct combination of the two elements in the electric furnace. It forms very hard metallic-looking crystals, burns in oxygen and is not attacked by acids. Potassium ruthenate, $\text{KRuO}_4\cdot\text{H}_2\text{O}$, obtained by fusion of the metal with caustic potash and nitre, crystallizes in prisms which become covered with a black deposit on exposure to moist air. It is soluble in water, giving an orange-red solution which becomes green on standing, and gradually deposits the hydrated pentoxide, $\text{RuO}_5\cdot\text{H}_2\text{O}$ (H. Debray and A. Joly, Comptes Rendus, 1888, 107, 594). The $\text{KRuO}_4$, formed by the action of chlorine on the ruthenate, or of alkalis on the peroxide at $50^\circ\text{C}$, is a black crystalline solid which is stable in dry air but decomposes when heated strongly. On treatment with water, ruthenate forms potassium ruthenate compounds see C. E. Claus, Ann., 1866, 58, p. 317; A. Joly, Comptes Rendus, 1888, 107, p. 684; 1889, 108, pp. 854, 1300; 1896, 111, p. 999; L. Brizard, ibid., 1886, 122, p. 739; 1896, 123, p. 182. The attribution of metal to iron was determined by A. Joly (Comptes Rendus, 1886, 188, p. 946), who obtained the values 105.1 and 103.

RUTHERFORD, MARK, the pen-name of William Hale White, English author, who was born at Bedford about 1830. His father, William White, a member of the nonconformist community of the Bunyan Meeting, removed to London, where he was well known as a doorkeeper of the House of Commons; he wrote sketches of parliamentary life for the Illustrated Times, papers afterwards collected by his son as The Inner Life of the House of Commons (1867). The son was educated for the Congregational ministry, but the development of his views prevented his taking up that career, and he became a clerk in the Admiralty. He had already served an apprenticeship to journalism before he made his name as a novelist by the three books "edited by Reuben Shapcott," The Autobiography of Mark Rutherford (1881), Mark Rutherford's Deliverance (1885), and The Revolution in Tanner's Lane (1887). Under his own name he translated Spinoza's Ethics (1883). Later books are Miriam's Schooling, and other Papers (1890), Katherine Purse (2 vols., 1893), Clara Hopgood (1898), Pages from a Journal, with other Papers (1900), and John Bunyan (1903). Though for a long time little appreciated by the public, his novels, particularly the later ones—have a power and style which must always give his works a place of their own in the literary history of their time.

RUTHERFORD, WILLIAM GUNION (1853–1907), English scholar, was born in Peeblesshire on the 17th of July 1853. He was educated at St Andrews and Oxford, where he graduated in natural science, with a view to following the medical profession, which he abandoned in favour of a scholastic career. From 1883 to 1901 he was headmaster of Westminster school; and his death, on the 10th of July 1907, deprived classical scholarship in England of one of its most brilliant modern representatives. Rutherford devoted special attention to Attic idioms and the language of Aristophanes. His most important work, the New Phrynicus (1882), dealing with the Atticism of the grammarians, was supplemented by his Babrius (1883), a specimen of the later Greek, which was the chief subject of C. A. Lobeck's Earlier commentary (1830 on Phrynicus. His edition of 1882–1890 of the New Comedy, &c., of the Ravenna MS. was less successful. Mention may also be made of his Elementary Greek Accidence and Lex Rux, a list of cognate words in Greek, Latin and English.

RUTHERFORD (or RUTHERFORD), SAMUEL (c. 1600–1661), Scottish divine, was born about 1600 at the village of Nisbet, Roxburghshire. He went to college at Edinburgh in 1617, graduating M.A. in 1621, and two years afterwards was elected professor of humanity. On an alleged indiscretion before his marriage in 1626 he was dismissed his professorship in that year, but, after studying theology, he was in 1627 appointed minister of Anwoth, Kirkcudbrightshire, and soon took a leading place among the clergy of Galloway. In 1636 his first book, entitled Exercitationes Apologeticae pro Divina Gratia—an elaborate treatise against Arminianism—appeared at Amsterdam. Its severe Calvinism led to a prosecution by the bishop Thomsa Sydserf, in the High Commission Court, first at Wigtown and afterwards at Edinburgh, with the result that Rutherford was deposed from his pastoral office, and sentenced to confinement in Aberdeen during the king's pleasure. His banishment lasted from September 1636 to February 1638, and the greater number of his published Letters belong to this period of his life. He was present at the signing of the Covenant in Edinburgh in 1638, and at the Glasgow Assembly of the same year he was restored to his parish. In 1639 he was appointed professor of divinity in St Mary's College, St Andrews. He only accepted the position on the condition that he should be allowed to act as colleague to Robert Blair in the church of St Andrews. He was sent up to London in 1643 as one of the eight commissioners from Scotland to the Westminster Assembly. Remaining at his post over three years, he did great service to the cause of his party. In 1642 he had published his Peaceable and Temperate Plea for Paul's Presbytery in Scotland, and the sequel to it in 1644 On the Due Right of Presbyteries provoked Milton's contemptuous reference to "mere A. S. and Rutherford" in his sonnet On the New Forcers of Conscience under the Long Parliament. In 1644 also appeared Rutherford's Lex Rux, A Dispute for the Just Prerogative of King and People, which gives him a recognised place among the early writers on constitutional law; it was followed by The Divine Right of Church Government and Excommunication (1646), and Free Disputation against Pretended Liberty of Conscience (1648), characterized by Bishop Heber as "perhaps the most elaborate defence of persecution which has ever appeared in a Christian country." Among his other works are the Tryal and Triumph of Faith (1645), Christ Dying and Drawing Sinners to Himself (1647), and Survey of the Spiritual Antichrist (1648). In 1647 he returned to St Andrews to become principal of the New College there, and in 1648 and 1651 he declined successive invitations to theological chairs at Hardwicke and Utrecht. After the Restoration in 1660, his Lex Rux was ordered to be burned. He was deprived of all his offices, and on a charge of high treason was cited to appear before the ensuing parliament. His health utterly broke down, and he drew up, on the 26th of February 1661, a Testimony, which was posthumously published. He died on the 3rd of the following March.

The fame of Rutherford now rests principally upon his remarkable Letters, which, to the number of 215, were first published anonymously by M'Ward, an amanuensis, as Joshua Redivivus, or Mr Rutherford's Letters, in 1664. They have been frequently reprinted, the best edition (365 letters) being that by Rev. A. A. Bonar, who in 1847, with other works already mentioned, Rutherford published in 1651 a treatise, De Divina Providentia, against Molinism, Socinianism and Arminianism, of which Richard Baxter, not without justice, remarked that the Letters were the best piece so this was the worst he had ever read."

RUTIN (Rhudd Ddin, "red fortress"), a municipal and contributory parliamentary borough (with Denbigh and Holt) and market town of Denbighshire, N. Wales, situated on a hill rising from the river Clwyd, 21 m. from Chester, and 215 from London by rail. Pop. (1901) 2643. It is on the Great Western railway (Denbigh, Corwen & Ruthin branch). Apart from the legends of Arthur and his limestone block (shown in the market-place), the first event of note in its history is its connexion with the de Grey de Ruthyn family (the first lord died 1333). Owen Glendower attacked it unsuccessfully in 1400. It was sold by the de Greys to Henry VII, and Elizabeth gave it to the earl of Warwick. In 1646, after two months' siege, it was dismanted by the Parliamentarians. The new castle occupies the same site, and is built of the same coloured sandstone as the old. New buildings for the Free Grammar School (founded in 1595 by Gabriel Goodman, dean of Westminster, who also in 1590 had built the hospital for twelve decayed housekeepers), were opened in the town in 1803. The old (conventional) Anglican church of St Peter, once belonging to "Les Bons-hommes," and made collegiate in 1310 by John de Grey, has a perpendicular north aisle roof, nearly 500 years old, and carved oak, and choisters which have been made into a house for the wardens of the hospital. Agriculture is the staple, but there are also chemical, aerated waters, bricks, terra-cotta and other manufactures.

RUTHVEN, the name of a noble Scottish family which traces its descent from a certain Thor, who settled in Scotland during the reign of David I. In 1248 one of its members, Sir William Ruthven (d. 1528), was created a lord of parliament as Lord Ruthven. His eldest son William was killed at Flodden in 1513, and consequently his grandson William succeeded him in the title, and after holding the offices of extraordinary lord of session and keeper of the privy seal died in December 1552, leaving three sons. The eldest of these, Patrick, 3rd Lord Ruthven (c. 1520-1566), played an important part in the political intrigues of the 16th century as a strong Protestant and a supporter of the lords of the congregation. He favoured the marriage of Mary with Darnley, and was the leader of the band which murdered Rizzio. This event was followed by his flight into England, where he died on the 13th of June 1566. Ruthven wrote for Queen Elizabeth a Relation of the murder, which is preserved in MSS. in the British Museum.

A descendant of the 1st Lord Ruthven in a collateral line, also named Patrick Ruthven (c. 1573-1651), distinguished himself in the service of Sweden, which he entered about 1606. As a negotiator he was very useful to Gustavus Adolphus because of his ability to "drink immeasurably and preserve his understanding to the last," and he also won fame on the field of battle. Having taken part in the Thirty Years' War and been governor of Ulm, he left the Swedish service and returned to Scotland, where he was employed by Charles I. He defended Edinburgh Castle for the king in 1640, and when the Civil War broke out he joined Charles at Shrewsbury. He led the left wing at the battle of Edgehill, and after this engagement was appointed general-in-chief of the Royalist forces.

For his services he was created Lord Ruthven of Etillock in 1639, earl of Forth in 1642 and earl of Brentford in 1644. The earl compelled Essex to surrender Lostwithiel, and was wounded at both battles of Newbury. But his faculties had begun to decay, and in 1644 he was superseded in his command by Prince Rupert. After visiting Sweden on a mission for Charles II., Brentford died at Dundee on the 2nd of February 1651. He left no sons and his titles became extinct.

Patrick, 3rd Lord Ruthven, was succeeded as 4th lord by his son William (c. 1541-1584), who like his father was prominent in the political intrigues of the period and was also concerned in the Rizzio murder. In 1582 he devised the plot to seize King James VI., known as the raid of Ruthven, and he was the fast-known custodian of the famous silver casket containing the letters alleged to have been written by Mary, queen of Scots, to Bothwell. In 1581 he was created earl of Gowrie, but all his honours were forfeited when he was attainted and executed in May 1584 (see Gowrie, 3rd Earl of).

The 2nd Lord Ruthven left a son, Alexander (d. 1599), the founder of the family of Ruthven of Freeland, and the grandfather of Sir Thomas Ruthven (d. 1673), on whom Charles II. bestowed the title of Lord Ruthven of Freeland in 1651. When his son David died unmarried in April 1701 the title of Baroness Ruthven was assumed by the latter's sister, Jean (d. 1722), although according to some authorities the peerage had become extinct. It was, however, assumed in 1722 by Isobel (d. 1732), wife of James Johnson, who took the name of Ruthven on succeeding to the family estates; and their son, James Ruthven (d. 1783), took the title and was allowed to vote at the elections of Scots representative peers. In 1853 the barony again descended to a female, Mary Elizabeth Thornton (c. 1784-1864), the wife of Walter Hore (d. 1878) She and her husband took the name of Hore-Ruthven, and their grandson, Walter James Hore-Ruthven (b. 1838), became the 8th baron in 1864.

RUTILIUS CLAUDIUS NAMATIANUS, Roman poet, flourished at the beginning of the 5th century a.d. He was the author of a Latin poem, De Reditu Suo, in elegiac metre, describing a coast voyage from Rome to Gaul under the literary excellence of those two and the flowers of light which it throws across a momentous but dark epoch of history, combine to give it exceptional importance among the relics of late Roman literature. The poem was in two books; the exordium of the first and the greater part of the second have been lost. What remains consists of about seven hundred lines.

The author is a native of S. Gaul (Toulouse or perhaps Poitiers), and belonged, like Sidonius, to one of the great governing families of the Gaulish provinces. His father, whom he called Lachanius, had held high offices in Italy and at the imperial court, and had been governor of Tuscia (Etruria and Umbria), then imperial treasurer (comes sacrarum largitionum), imperial recorder (quæstor), and governor of the capital itself (praefectus urbi). Rutilius boasts his career to have been no less distinguished than his father's, and particularly indicates that he had been secretary of state (magister officiorum) and governor of the capital (i.e., 157, 427, 467, 561). After reaching manhood, he passed through the tempestuous period between the death of Theodosius (395) and the fall of the usurper Attalus, which occurred near the date when his poem was written. He witnessed the chequered career of Stilicho as actual, though not titular, emperor of the West; he saw the Gauls and the Goths, who had swept over Gaul and Spain; the defeats and triumphs of Alaric; the three sieges and final sack of Rome, followed by the marvellous recovery of the city; Heraclian's vast armament dissipated; and the fall of seven pretenders to the Western diadem. Undoubtedly the sympathies of Rutilius were with those who during this period dissented from and, when they could, opposed the general tendencies of the imperial policy. We know from himself that he was the intimate of those who belonged to the circle of the great orator Symmachus—men who scouted Stilicho's compact with the Goths, and led the Roman senate to support the pretenders Eugenius and Attalus in the vain hope of reinstating the gods whom Julian had failed to save.

While making but few direct assertions about historical characters or events, the poem forces on us important conclusions concerning the politics and religion of the time. The attitude of the poet is that of a Christian clergyman in the 5th century, and is intensely pagan, and is penetrated by the feeling that the world of literature and culture is and must remain pagan; that outside paganism lies a realm of barbarism. The poet wears an air of exalted piety, and the result is a poet who gladly and confidently entertains a buoyant confidence that the future of the ancient gods of Rome will not bereave their glorious past. Inevitable and apologetic he scorcs alike, nor troubles himself to show, with Claudian, even a suppressed grief at the indignities put upon the old religion by the Christian mistress of the Empire. As a statesman, he is at pains to avoid offending those politic Christian senators over whom pride in their country had at once as great or greater power as attachment to their new religion. Only once or twice does Rutilius speak directly of Christianity, and then only after the death of his own father, towards whom the temporal authorities had hardly as yet recognized, and whom, indeed, only a short time before, a Christian emperor had forced; thousands into the ranks of his army. Judaism Rutilius could assail without fear; the knowledge of his audience was so small; and his voice is assuredly not that of a partisan of a discerned and overborne faction. We see by the aid of his poem a senate at Rome composed of post-office holders, the majority of whom were certainly pagan still. We discern a Christian section who were Romans first and Christians afterwards, whom a new breeze in politics might easily have waited back to the old religion. Between these two sections the broad old Roman toleration reigns. Some ecclesiastical historians have fondly imagined that after the death of the bishop Innocent returned to a position of predominance. No one who fairly reads Rutilius can cherish this idea. The air of the capital, perhaps even of Italy, was still charged with paganism. The court was far in advance of the people, and the persecuting laws were in large part incapable of execution.

Perhaps the most interesting lines in the whole poem are those in which Stilicho and his associates are described, as he himself names him. Stilicho, "fearing to suffer all that had caused himself to be feared," annihilated those defences of Alps and Apennines which the provident gods had interposed between the barbarians and the Eternal City, and planted the cruel Goths, his own people, in the very heart of Italy. His wife was wickeder than the wife of the Trojan horse, than the wife of Althaea or of Scylla. May Nero rest from all the torments of the damned, that they may seize on Stilicho; for Nero smote his own dominion, but Stilicho conquered the world! We shall not err in supposing that we have here (what we find nowhere else) an authentic expression of the feeling entertained by a majority of the Roman senate concerning Stilicho. He had been long the policy and he was the power of his masters; but even that great emperor had met with passive opposition from the old Roman families. The relations, however, between Alaric and Stilicho had been closer and more mysterious than those between Attila and Theodosius, and men who had seen Stilicho appointed by his own emperor of Goths not unnaturally looked on the Goths as assailed Rome as Stilicho's avengers. It is noteworthy that Rutilius speaks of the crime of Stilicho in terms far different from those used by Orosius and the historians of the time.

They describe him, his colleagues, and his associates as men who made the emperor their son, and that he called in the Goths in order to climb higher. Rutilius holds that he used the barbarians merely to save himself from impending ruin. The Christian historians assert that the king of the Goths was a new man with the unimpeachably sincere and most uncompromising foe of paganism. His crowning sin (recorded by the poet alone) was the destruction of the Sibyl's books—a sin worthy of one who had decked his wife in the spoils of Victory, and who had set up his dog as a god by the side of the Vestal Virgins. With regard to the form of the poem, Rutilius handles the elegiac couplet with great metrical purity and freedom, and betrays many signs of long study in the elegiac poetry of the Augustan era. The Latin is unusually clean for the times, and is generally very classical both in vocabulary and construction. The taste of Rutilius, too, is comparatively pure. If he lacks the genius of Claudian, he also lacks his overloaded gaudiness and his large exaggeration, and the directness of Rutilius shines by comparison with the cold elaborate and polished style of the Claudian the last of the Roman poets. That title might fairly be claimed for Rutilius, unless it be reserved for Merobaudes. At any rate, in passing from Rutilius to Sidonius no reader can fail to feel that he has left the region of Latin poetry for the region of Latin verse.

Of the many interesting details of the poem we can only mention a few. At the outset we have an almost dithyrambic address to the goddess Roma, whose glory is now lost, but who still has more in her might and confounded her barbarian foes. The poet shows as deep a consciousness as any modern historian that the grandest achievement of Rome was the spread of law. Next we get incidental but not unimportant references to the destruction and desolation of cities by the Goths, to the state of the havens at the mouths of the Tiber, and the general decay of nearly all the old commercial ports on the coast. Most of these were as desolate then as now. Rutilius even exaggerates the desolation of the once important city of Cosa in Etruria, whose walls have scarcely changed from that day to ours. The port that served Pisa, almost alone of all those visited by Rutilius, seems to have retained its prosperity, and to have foreshadowed the glory of her daughter, the Pisa of the modern world. It is connected with the villages everywhere of "soothing their weared hearts with holy merriment," and were celebrating the festival of Osiris.

AUTHORITIES—All existing MSS. of Rutilius are later than 1494, and are copied from a manuscript of Berry (3rd century) once at the monastery of Bobbio, which disappeared about 1700. The edition princeps is that by J. B. Pius (Bologna, 1520), and the principal editions since then have been those by Barth (1623), P. Burman (1731, in his edition of the minor Latin poets), Pichon (1826), Pichon's edition (1867), and the critical edition edited by Lucian Müller (Leipzig, 1870), and another by Verbeeck (1894); also an annotated edition by Keene, with a translation by G. F. Savage-Armstrong (1906). Müller writes the poet's name as Claudius Claudius Claudianus, but Rutilius was Claudius Claudianus Claudianus; but if the identification of the poet's father with the Claudius mentioned in the Theodosian Code (2, 4, 5) be correct, Müller is probably wrong. Rutilius receives more less attentions from all the critics in the history of the times, but a lucid chapter in Beugnot, Histoire de la destruction du Paganisme en Occident (1835), may be especially mentioned, and one in Pichon's Derniers écrivains profanes (1906). (J. S. R.)
RUTILIUS RUFUS—RUTLAND, 7TH DUKE OF

RUTILIUS RUFUS, PUBLIVUS. Roman statesman, orator and historian, born c. 158 B.C. He was on intimate terms with the younger Scipio, under whom he served in the Numantine War (134), and he also accompanied Q. Metellus Numidicus in the campaign against Jugurtha (106). In 132 he was elected to the consulship, and restored the discipline of the army and introduced an improved system of drill. Subsequently, he went as legate to Q. Mucius Scaevola, governor of Asia. By assisting his superior in his efforts to protect the provincials from the extortions of the publicani, or farmers of taxes, Rufus incurred the hatred of the equestrian order, to which the publicani belonged. In 92 he was charged with the very offence of extortion which he had done himself to prevent. The charge was absurd, but as the juries at that time were chosen from the equites, his condemnation was only to be expected. Rufus accepted the verdict with the resignation befitting a Stoic and pupil of Panaetius. He retired to Mytilene, and afterwards to Smyrna, where he spent the rest of his life, and where Cicero saw him as late as the year 78. Although invited by Sulla to return to Rome, Rufus refused to do so. It was doubtless during his stay at Smyrna that he wrote his autobiography and a history of Rome in Greek, part of which is known to have been devoted to the Numantine War. He possessed a thorough knowledge of law, and wrote treatises on that subject, some fragments of which are quoted in the Digests. He was also well acquainted with Greek literature.

RUTLAND, EARLS AND DUKES OF. The 1st earl of Rutland was Edward Plantagenet (1337-1415), son of Edmund, duke of York, and grandson of King Edward III. In 1390 he was created earl of Rutland, but was to hold the title only during the lifetime of his father, on whose death in 1402 the earldom accordingly became extinct, the earl then becoming duke of York. The title earl of Rutland seems to have been assumed subsequently by different members of the house of York, though it does not appear that any of them had a legal right to it. One of these was the 1st earl's nephew, Richard Plantagenet, duke of York, father of King Edward IV. Richard's daughter Anne married for her second husband Sir Thomas St Leger, and their daughter Anne married George Manners, 12th Baron Ros, or Roos (d. 1513). Their son, Thomas Manners (d. 1534), was therefore great-grandson of Richard Plantagenet, who had styled himself earl of Rutland among other titles. In 1525 Thomas Manners, 1st Earl of Rutland (1505-1618), but it was again separated from the earldom of Rutland on the death of Francis without male issue, and the assumption of the courtesy title of Lord Ros by the eldest son of subsequent earls of Rutland appears to have had no legal basis.

The 8th earl, a cousin of his predecessor and also of the 6th earl, was John (1604-1679), eldest son of Sir George Manners (d. 1623) of Haddon, a descendant of Sir John Manners, the second son of the 1st earl. His son John, 7th earl (1658-1711), a party to the revolution of 1688, received the Princess Anne at Belvoir Castle on her flight from London; after the accession of Anne to the throne she created him marquess of Granby and duke of Rutland in 1703. The 1st duke was three times married; the divorce in 1670, while he was still known as Lord Ros, of his first wife, Anne, daughter of the marquess of Dorchester, was a very celebrated legal case, being the first instance of divorce a vinculo by act of parliament, a divorce a mensa et thoro having previously been granted by the ecclesiastical courts. His grandson John, the 3rd duke (1666-1770), was the father of John Manners, marquess of Granby (q.v.), a distinguished soldier, whose son Charles, 4th duke of Rutland (1754-1787), succeeded his grandfather. When marquess of Granby he represented Cambridge University in the House of Commons, and hotly opposed the policy that led to war with the American colonies. He was instrumental in procuring the entrance of the younger Pitt to the House of Commons, and remained throughout life an intimate friend of that statesman. After succeeding to the dukedom in 1779, he sat in the cabinets of Shelburne and of Pitt, and became lord lieutenant of Ireland in 1784. He was one of the earliest to advocate a legislative union between Ireland and Great Britain, which he recommended in a letter to Pitt in June, 1779. In 1811 he married his second time private chaplain to the duke at Belvoir. His wife, Mary Isabella (1756-1831), "the beautiful duchess," whose portrait was four times painted by Sir Joshua Reynolds, was a daughter of the 4th duke of Beaufort. His eldest son, John Henry, 5th duke (1778-1857), was "the duke" in Disraeli's Coningsby; the latter's two sons, the marquess of Granby and Lord John Manners, figuring in the same novel as "the marquis of Beaumanoir" and "Lord Henry Sidney" respectively. Both these sons succeeded in turn to the dukedom, Lord John Manners succeeding his brother Charles Cecil John, the 6th duke (1815-1888), as 7th duke of Rutland (see below) in 1888. In 1801 he was made a knight of the Garter, being the tenth earl and the sixth duke of Rutland of the same creation to wear this illustrious order.

RUTLAND, JOHN JAMES ROBERT MANNERS, 7TH DUKE OF (1818-1906), English statesman, was born at Belvoir Castle on the 13th of December 1818, being the younger son of the 5th duke of Rutland by Lady Elizabeth Howard, daughter of Byron's guardian, the 5th earl of Carlisle. Lord John Manners, as he then was, was educated at Eton and Trinity College, Cambridge; in 1831 he was returned for York as a Tory interest, along with W. E. Gladstone, and sat for that borough until 1847. Subsequently he sat for Colchester, 1850-57; for North Leicestershire, 1857-83; and for East Leicestershire from 1885 until 1888 he took his seat in the House of Lords upon succeeding to the dukedom.

Melbourne's Whig government had been doomed for some time before it went out in June 1841. The Tories came in with a large majority under Peel, and among Manners's friends who were successful in the constituencies, besides Gladstone, were Smythe, afterwards 7th Viscount Strangford, at Canterbury; Baillie-Cochrane, afterwards 1st Lord Lamington, at Bridport; and Disraeli at Shrewsbury. Cherishing many of the ideas of the cavaliers of the 17th century, and full of political and literary ardour, Lord John was soon prominent in the social group which revolved round Lady Blessington. In 1841 he committed some of his loyalist and other fancies to a volume called England's Trust, and other Poems, which he dedicated to his friend Smythe, and in which occurred the familiar line about "laws and learning and our old nobility." Before the 1847 election he had undertaken to support himself with the "Young England" party, under the leadership of Disraeli. This party sought to extinguish the predominance of the middle-class bourgeoisie, and to re-create the political prestige of the aristocracy by resolutely proving its capacity to ameliorate the social, intellectual, and material condition of
of Ireland which the in the further. Manners made an extensive tour of inspection in the industrial parts of N. England, in the course of which he and his friend Smythe expounded their views with a brilliancy which frequently extorted compliments from the leaders of the Manchester school. In 1843 he supported Lord Grey’s motion for an inquiry into the condition of England, the serious disaffection of the working classes of the north being a subject to which he was constantly drawing the attention of parliament. Among other measures that he urged were the disestablishment of the Irish Church, the modification of the Mortmain Acts, and the resumption of regular diplomatic relations with the Vatican. In the same year he issued in pamphlet form a strong *Plea for National Holydays*. In 1844 Lord John vigorously supported the Ten-hours Bill, which, though strongly opposed by Bright, Cobden, and other members of the Manchester school, was ultimately passed in May 1847. In October during that year he took part in, and spoke at, the brilliant *sorcire* held at the Manchester Athenaeum under the presidency of Disraeli. A few days later he and his friends attended a festival at Bingrie in Yorkshire, to celebrate the allotment of land for gardens to working men, a step which, through the agency of his father, he had done a great deal to further. About the same time Smythe dedicated to him his *Historic Fancies* as to “the Sir Philip Sidney of our generation.” Manners figured as Lord Henry Sidney in Disraeli’s *Coningsby*, and not a few of his ideas are represented as those of Egremont in *Sybil* and Waldershare in *Endymion*. But the disruption of the Young England party was already impending. Lord John’s support to Peel’s decision to increase the Maynooth grant in 1845 led to a difference with Disraeli. Divergences of opinion with regard to Newman’s secession from the English Church produced further detections in the ranks, and the rupture was completed by Smythe acquiescing in Peel’s conversion to Free Trade. Lord John produced another volume of verse, known as *English Ballads*, chiefly patriotic and historical, in 1850. In the same year he wrote the letterpress for an atlas of coloured views by J. C. Schetky; and he published several pamphlets, one on the *Church of England in the Colonies*, in 1851. During the three short administrations of Lord Derby (1851, 1858, and 1866) he sat in the cabinet as first commissioner of the office of works. On the return of the Conservatives to power in 1874 he became postmaster-general in Disraeli’s administration, and was made G.C.B. on his retirement in 1880. He was again postmaster-general in Lord Salisbury’s administration, 1885–86, and was head of the department when sixty penny telegraphs were introduced. Finally, in the Conservative government of 1886–92 he was chancellor of the duchy of Lancaster. He had succeeded to the dukedom of Rutland in March 1888, upon the death of his elder brother. He died on the 4th of August 1906 at Belvoir Castle.

He was succeeded as 8th duke by his eldest son (b. 1852), who had been Conservative M.P. for the Melton division of Leicestershire from 1888 to 1895; and whose wife, as marchioness of Granby, became well known as a clever artist, a volume of her *Portraits* of various distinguished men and women being published in 1895.

**Rutland**, a midland county of England, bounded N. and E. by Lincolnshire, N. and W. by Leicestershire, and S.E. by Northamptonshire. It is the smallest county in England, having an area of 152 sq. m. The surface is pleasantly undulating, ridges of high ground running E. and W. separated by valleys. The principal river is the Wyming, and the vale of Catmose, in the Oakham district, to the N. of which rises a tableland commanding wide views into Leicestershire. The vale maintains its reputation for richness of soil assigned to it by Drayton in his *Poly-Olbion*. This, the N.W. part of the county, is also the district of the well-known Cottesmore hunt.

The royal forest of Lyfield, or Leafield, which included the greater part of the hundreds of Oakham and Martiney, once extended over the county between Oakham and Uppingham, and patches of it still exist. To the S. of Uppingham it was known as Beaumont Chase. The river Welland, flowing N.E., forms the S.E. boundary of Rutland with Northamptonshire. The Gwash, or Wash, which rises in Leicestershire, flows eastward through the centre of the county, and just beyond its borders in Lincolnshire joins the Welland. The Chater, also rising in Leicestershire and flowing E., enters the Welland about 2 m. from Stamford. The Eye, forming part of the S.W. boundary, is also tributary to the Welland.

**Geology.**—The county consists entirely of Jurassic formations, viz. of Liassic and Oolitic strata—the harder beds, chiefly limestone containing iron, forming the hills and escarpments, and the claybeds the slopes of the valleys. The oldest rocks are those belonging to the Lower Lias in the N.W. The bottom of the vale of Catmose is formed of marlstone rock belonging to the Middle Lias, and its sides are composed of long slopes of Upper Lias clay. The Upper Lias covers a large area in the W. of the county, and is worked for bricks at Luffingham and Seaton. The lowest of the Oolitic formations is the Northampton sand, which has yielded iron ore at Manton and Cottesmore. The Lincolnshire Oolite limestone quarried at Ossington is largely used for brick-making; and the quarries at Ketton, Clispeach, and Castleby are famous beyond the boundaries of the county. The Great Oolite and Estuarine beds predominate all the way towards the S.E. Gloucestershire dolerite, lenticular bed of greywacke, sand and gravel, and to the E. strata in many places.

**Industries.**—In the E. and S.E. districts the soil is light and shallow. In the other districts it consists chiefly of a tenacious but fertile loam, and in the vale of Catmose the soil is either clay or loam, the water table being low. The oak and elm woods, which colours even the streams, is owing to the ferruginous limestone carried down from the slopes of the hills. The name of the county is by some authorities derived from this characteristic of the soil, but the explanation is doubtful. The E. of the county is chiefly under tillage and the W. in grass. Nearly nine-tenths of the total area (a high proportion) is under cultivation, wheat being far the most important grain crop. Turnips and swedes occupy the greater part of the land in Lincolnshire; and the N. part of the county (the Nene and South Downs) and cattle (Shorthorns) occupies the chief attention of the farmer. Large quantities of cheese are manufactured and sold as Stilton. Agriculture is practically the only industry of importance, but there is some quarrying and brick-making.

The main line of the Great Northern railway intersects the N.E. corner, and branches of that system, of the London & North-Western, and of the Midland railways, serve the remainder of the county.

**Population and Administration.**—The area of the ancient and administrative county is 97,273 acres, with a population in 1891 of 29,659, and in 1901 of 29,709. The county contains five hundreds. There are no municipal boroughs or urban districts. The county town is Granby; the county town (1888) is Oakham (pop. 1,664, 1901). It contains seven (Lincolnshire and South Downs) and cattle (Shortorns) occupies the chief attention of the farmer. Large quantities of cheese are manufactured and sold as Stilton. Agriculture is practically the only industry of importance, but there is some quarrying and brick-making.

The main line of the Great Northern railway intersects the N.E. corner, and branches of that system, of the London & North-Western, and of the Midland railways, serve the remainder of the county.

- **History.**—The district which is now Rutland was probably occupied by a tribe of Middle Angles in the 6th or 7th century, and was subsequently absorbed in the kingdom of Mercia. Although mentioned by name in the will of Edward the Confessor, who bequeathed it to his queen Edith for life with remainder to Westminster Abbey, Rutland did not rank as a county at the time of the Domesday Survey, in which the term Rutland is only applied to that portion assessed under Northamptonshire, while the S.E. portion of the modern county is surveyed under Northamptonshire, where it appears as the wapentake of Wicesla. Rutland is first mentioned as a distinct county under the administration of a separate sheriff in the pipe roll of 1159, but as late as the 14th century it is designated "Rutland Soke", in the卷轴中的插图。
and Wrangle's hundred are mentioned in the middle of the 13th century, the latter formerly including the additional hundred of Little Casterton. The shire-court for Rutland was held at Oakham.

Rutland was originally included in the diocese of Lincoln, and in 1291 formed a rural deanery within the archdeaconry of Northampton; but on the erection of Peterborough to an episcopal see by Henry VIII. in 1541, the archdeaconry of Northampton, with the deanship of Rutland, was transferred to that diocese. In 1870 the deanship of Rutland was subdivided into three portions, and in 1876 it was placed within the newly-founded archdeaconry of Oakham.

Among the most conspicuous of the Norman lords connected with this county was Walkelin de Ferrers, who founded Oakham Castle in the 12th century. The castle was subsequently bestowed by Richard II., together with the earldom of Rutland (see above), on Edward, son of Edmund, duke of York. Essendine (Essenden or Essingdon) was purchased in 1545 by Richard Cecil of Burleigh, and the title of baron of Essendine bestowed on his grandson is retained by the earls of Salisbury.

Sir Everard Dilke, one of the conspirators in the Gunpowder plot, belonged to the family of Digby, of Stoke Dry. Burley-on-the-Hill was held by Henry Despenser, the warlike bishop of Norwich, in the reign of Richard II., and was purchased by George Villiers, duke of Buckingham, who entertained James I. there with Ben Jonson's Mask of the Gypsies.

The battle of Stamford was fought at Hone, near Exton; in March 1470 between Edward IV. and the Lancastrians, when from the precipitate flight of the latter the engagement became known as Losecoast Field. On the outbreak of the Civil War Rutland displayed a strong puritanical and anti-royalist sentiment, and in 1642 the sheriff and a large number of the gentry and nobility of the county forwarded a petition to the House of Lords begging that the county might be placed in a state of defence, and that the votes of papists and prelates might be disallowed; and again, in 1648, a memorial addressed to Lord Fauconberg, protests against the design of the parliament to treat with Charles.

Rutland has always been mainly an agricultural county. The Domesday Survey mentions numerous mills in Rutland, and a fishery at Ayton rendered 325 eels. In the 14th century the county exported wool. Stilton cheese has long been made in Leyfield Forest and the vale of Catmose, and limestone is dug in many parts of the county. The development of the economic resources of Rutland was helped in 1793 by the extension of the Melton Mowbray canal to Oakham.

Two members were returned to parliament for the county of Rutland from 1295 until under the Redistribution of Seats Act of 1858 the representation was reduced to one member.

The only old castle of which there are important remains is Oakham, dating from the time of Henry II. and remarkable for its Norman hall. Of Essendine Castle only the moat remains. The Bede-house at Liddington dates from the end of the 14th century. Hambleton Hall, now a farm-house, is a good specimen of Jacobean architecture. Many old houses of the 17th and 18th centuries are to be met with in the villages. An interesting feature of the ecclesiastical architecture of the county is the frequent occurrence of round-headed or arch-shaped altars. The early English style had become fully developed: as, for instance, in the Early English churches at Great Casterton, Streton, Empingham, Clipsham (Early English and Decorated), and St Peter's, Preston, where the nave arcade is Norman on one side and Early English on the other, while in the rest of the church the arches and side-aisles are round-headed. The wooden screen in the church is a remarkable specimen of late Norman work, with one of the finest chancel-arches extant in this style. Ketton church is transitional Norman, Early English, and early Decorated, the building of later date. St Mary's, Greetham, is a good example of Decorated, with fine tower and spire.

See Victoria County History, Rutland; James Wright, History and Antiquities of the County of Rutland (London, 1864); T. Blome, Histoire de la Compagnie de la Cloche du Comte de Rutland, vol. i. p. 2 (containing the East hundred and including the hundred of Casterton Parva; Stamford, 1811); C. G. Smith, A Translation of that portion of the Domesday Book which relates to Lincolnshire and Rutland (London, 1874).

Rutland, a town and the county seat of Rutland county, Vermont, U.S.A., on Otter creek, about 67 m. S. by E. of Burlington. Pop. (1900) 11,499, of whom 1533 were foreign-born; (1910 census 13,546. Area, 81 sq. m. It is served by the Delavan & Hudsons (being a terminus of one of its branches) and the Rutland (New York Central system) railways. It is pleasantly situated within sight of the Green Mountains. Among its public buildings and institutions are the United States Government Building, the State House of Correction, the Rutland Free Library (1886, with 17,500 volumes in 1908), the H. B. Baxter Memorial Library, a Memorial Hall, the County Court House, the City Hall, and the City Hospital. The famous Rutland marble is quarried in W. Rutland (pop. in 1910, 3427 and Proctor (pop. in 1910, 2871), which were parts of the township of Rutland until 1886. In 1905 the value of the city's factory products was $4,522,856 (28.8% more than in 1900). The township of Rutland was granted by New Hampshire in 1761 to John Murray of Rutland, Massachusetts, and about the same time it was granted (as Fairfield) by New York. No settlement was made until 1770, and in 1772 the place was again granted by New York under the name of Socialborough. From 1784 to 1804 Rutland was one of the capitals of Vermont, and the Capitol, built in 1784, is the second oldest building in the state. The Rutland Herald, one of the oldest newspapers in Vermont still published, was established as a Federalist weekly in 1794—a daily edition first appeared in 1861, and is now Republican. In 1847 the village of Rutland was incorporated, and in 1892 a portion of the township including the village was chartered as a city.

Rutledge, John (1739-1800), American jurist and politician, was born in Charleston, South Carolina, in 1739. He studied law in London and began to practise in Charleston in 1761. He was a delegate to the Stamp Act Congress in 1765, and to the Continental Congress in 1774-77 and 1782-83; he was chairman of the committee which framed the state constitution of 1776, and the first "president" (governor) of South Carolina in 1776-78. Disapproving of certain changes in the constitution, he resigned in 1777. He was a member of the state legislature in 1778 year, and served until 1782. From 1784 to 1789 he was a member of the state council of censure. In the Constitutional Convention of 1788 he urged that the president and the Federal judges should be chosen by the national legislature, and preferably by the Senate alone, and that the "president" should be chosen for a term of seven years, and should be ineligible to succeed himself. Rutledge championed the Constitution in the South Carolina convention by which that instrument was adopted on behalf of the state. He was associate justice of the United States Supreme Court in 1780-91, and chief justice of the supreme court of South Carolina in 1794-95. Nominated chief justice of the Supreme Court of the United States in 1795, he presided during the August term; but the Senate refused to confirm the nomination, apparently because of his opposition to the Jay Treaty. His mind failed late in 1795, and he died in Charleston the 23rd of July 1800.

His brother, Edward Rutledge (1749-1800), a signer of the Declaration of Independence, was born in Charleston on the 23rd of November 1749. He studied law in his brother's office, and in London in 1760-73, and began to practise in Charleston in 1773. He served in the Continental Congress in 1774-77, and was sent with John Adams and Benjamin Franklin to confer on terms of peace with Lord Howe at Staten Island in September 1776. As captain of artillery and later as lieutenant-colonel he served against the British in South Carolina in 1779-80, but he was captured near Charleston in 1780, and was imprisoned at St Augustine, Florida, for a year. He was a member of the state legislature from 1782 to 1798, and in 1791 drafted the act which abolished primogeniture in South Carolina. From 1798 until his death in Charleston, on the 23d of January 1800, he was governor of South Carolina.
RUTULI—RUWENZORI

when he became an Assistant Geologist on the Geological Survey. Working then in the Lake district, he began to make a special study of rocks and rock-forming minerals, and soon qualified as acting petrographer on the Geological Survey. For several years he worked in this capacity at the Museum in Jermyn Street: he described the volcanic rocks of E. Somerset and the Bristol district in 1876, and wrote special memoirs on The Erupotive Rocks of Brecon Tor (1878), and on The Felistic Laves of England and Wales (1885). He was the author of an exceedingly useful little book on Mineralogy (1874; 12th ed., 1900); also of The Study of Rocks (1879; 2nd ed., 1881), Rock-forming Minerals (1888), and Granites and Greenstones (1894); and of a number of petrographical papers, dealing with perlitic and spherulitic structures, with the rocks of the Malvern Hills, &c. In 1882 he was appointed lecturer on Mineralogy in the Royal College of Science, and held this post till ill-health compelled him to retire in 1898. He died in London on the 16th of May 1904.

Obituary (by H. B. Woodward), with bibliography, in Geol. Mag. (July 1904).

RUTULI, a people of ancient Italy inhabiting Ardea and the adjacent country in the midst of Latium, at no great distance from Aricia and just w. of the territory of the Volsci. They are ranked by the form of their name with the Siculi and Appuli (Apuli), probably also with the Itali, whose real Italic name would probably have been Vitudi (see ITALY). This suggests that they belong to a fairly early stratum of the Indo-European population of Italy. The same is suggested by the tradition adopted or moulded by Virgil, by which the leader of the people of the soil in their resistance to the settlement of Aeneas was the Rutulian prince Turnus, a name which, if any conjecture could be founded on it, might be held to point rather to Etruria than to any pure Italic source; he is represented as the hospes of the exiled Etruscan king Mentius, and as taking up arms to defend him against his angry subjects. Pliny (iil. § 6) classes them, with the Siculi, among the primitive tribes that at one time or another inhabited part of Latium, and it is to be observed that they are not included in the thirty Latin communities which once took part in the Latin Festival on the Alban Mount (see further Siculi).

RUTY, MARQUIS DE, later the Earl of Galway (1648-1720), was born at Paris on the 9th of April 1648, and was the son of the 1st Marquis de Ruvinay, a distinguished French diplomatist, and a relative of Rachel, the wife of Lord William Russell. He saw service under Turenne, who thought very highly of him. Probably on account of his English connexions he was selected in 1678 by Louis XIV. to carry out the secret negotiations for a compact with Charles II., a difficult mission which he executed with great skill. Succeeding his father as "general of the Huguenots," he refused Louis's offer, at the revocation of the Edict of Nantes, to retain him in that office, and in 1690, having gone into exile with his fellow Huguenot, he entered the service of William III. of England as a major-general, forfeiting thereby his French estates. In July 1691 he distinguished himself at the battle of Aurchim, and in 1692 he was for a time commander-in-chief in Ireland. In November of that year he was created Viscount Galway and Baron Portarlington, and received a large grant of forfeited estates in Ireland. In 1693 he fought at Jersey under and was wounded; and in 1697, with the rank of lieutenant-general, he was sent to command a force in English pay which was to assist the duke of Savoy against the French, and at the same time to relieve the distressed Vaudois. But in 1695 the duke changed sides, the Italian peninsula was neutralized, and Galway's force was withdrawn to the Netherlands. From 1697 to 1701, a critical period of Irish history, the Earl of Galway (he was advanced to that rank in 1697) was practically in control of Irish affairs as lord justice of Ireland. After some years spent in retirement, he was appointed in 1704 to command the allied forces in Portugal, a post which he sustained with honour and success until the battle of Almanza in 1707, in which Galway, in spite of care and skill on his own part, was decisively defeated. But he scraped together a fresh army, and, although infirm, was reappointed to his command by the home government. After taking part in one more campaign, and distinguishing himself by his personal bravery in action, he retired from active life. His last service was rendered in 1715, when he was sent as one of the lords justices to Ireland during the Jacobite insurrection. As most of his property in Ireland had been restored to its former owners, and all his French estates had long before been forfeited, parliament voted him pensions amounting to £1500 a year. He died unmarried on the 3rd of September 1720. The English peerage died with him, but not the French marquisate.

RUVO, a town and episcopal see of Apulia, Italy, in the province of Bari, 21 m. W. of the city of that name by steam tramway, 873 ft. above sea-level. Pop. (1901) 25,425. The cathedral, a basilica with a very lofty nave (so high, indeed, that the gable of the façade is only slightly above the steep sloping roofs of the aisles, and the clerestory is very small), and with two aisles, has three apses, a square campanile and a rich façade with three portals. It belongs probably to the 13th century. The interior has a fine triforium; it contains several Roman and 13th-century frescoes. It contains in Apulia in having a gallery supported by corbels round the nave (see A. Avena, Monumenti dell'Italia Meridionale, Rome, 1902, 117). S. Giovanni Rotondo is an ancient circular baptistery with two large fonts. In the Palazzo Jatta is a famous and beautiful collection of vases and coins found in the Apulian tombs around the city; part of these, however, are now to be found in the museum at Naples. The Palazzo Spinola has an interesting Renaissance court. Ruvo occupies the site of the ancient Rubi, on the Via Trajana (see APPIA, VIA). Coins were issued by the city before it became Roman.

RUWENZORI, more correctly Runsoro, said to be known also as Kokora, a mountain range in Central Africa, lying just north of the equator, and intersected near its eastern edge by 30° E. "It has a length of about 95 m., with a maximum breadth of about 30 m., and its highest peaks rise above the limits of perpetual snow." The range as a whole, the major axis of which runs a little east of north, falls steeply on the west to the Central African rift-valley traversed by the Semiliki, the western head-stream of the basin of the Nile, while on the east the fall is somewhat more gradual towards the highlands of western Uganda. The upper parts are separated by fairly low passes into six groups of snowly summits, lying a little to the west of the central line, rising in each case more than 15,000 ft. above the sea and reaching, in the culmination point of the western group (Mount Stanley), about 16,800 ft.

The origin of the range seems connected with that of the rift-valley on the west, both being due to vertical displacements of the earth's crust. Ruwenzori has been formed by an upheaval en masse of a portion of the archean floor of the continent, bounded east and west by lines of fracture, but resulting in a general dip from west to east. A further upheaval seems to have produced an elliptoidal anticline, causing the strata to dip outwards at a generally high angle. Traces of volcanic action are almost non-existent. Composed in its outer parts of gneisses and mica-schists offering no great resistance to denudation, in its centre the range consists of much more plastic amphibolites, diorites, diabases, &c.), to which fact, coupled with the existence of vertical fractures, the persistence and separation of the higher summits is probably due. The snow-clad area does not now extend more than ten miles in any direction, though there is abundant evidence that the glaciers were formerly far more extensive.

The upper region is almost entirely enveloped by day in thick cloud, which descends to the east to about 9000 ft., and lower still on the west. It sometimes lifts towards evening, giving a sight of the snowly peaks, but by 9 a.m. these have

    1 The later Viscounts Galway are descended from John Moncout (1605-1751), who was created viscount in 1727. His first wife's mother, wife of the 2nd Duke of Rutland, was a daughter of Lady William Russell, and thus a connexion of the Ruvignys.
once more been hidden. As a result, the climate is very humid, the rainfall being probably at least 100 in. annually, and the slopes are furrowed by numberless streams, the most important fed by the glaciers of the upper region, and afterwards flowing in deep cut valleys between the outer spurs. From the innermost recesses between Mounts Stanley, Speke and Baker, the main branches of the Mobuku descend to the east, while the four principal streams on the west unite to form the Butagu, the drainage on both sides ultimately finding its way to the Semiluki, either directly or through Lake Dweru and the Albert Edward Nyanza.

In other ranges of Central Africa the vegetation displays well-marked zones, varying with the altitude; but owing to the lower level to which the clouds descend on the west (probably an outcome of the general climatic régime of Central Africa, as the range lies between the east African plateau and the relatively low-lying basin of the Congo), the limits of the several zones reach a lower level on the west than on the east. They have been defined as follows by Mr R. B. Woosnam of the British Museum scientific expedition of 1906-7:

<table>
<thead>
<tr>
<th>Zones</th>
<th>Upper Limits (East Side)</th>

above which is the summit region of snow and bare rock. The boundaries between the zones are not of course hard and fast lines, but merely indicate the levels between which the respective forms are specially characteristic, though they occur also in higher or lower zones. The forest zone is perhaps the best marked, being visible from a distance as a dark ring. On the west it merges in part with the low-lying forest of the Semiluki valley. Owing to the abundance of moisture, mosses, hepaticae and lichens are prevalent in several of the zones, and bogs, with Vaccinium and other low-growing plants, are common above the forest zone. Helichrysums are abundant in the zone immediately below the snow, where they form large bushes. The larger mammals are found chiefly on the lower slopes, but bushbuck, pigs, leopards, monkeys, a hyrax and a serval cat occur at higher altitudes. The birds include kites, buzzards, ravens, sun-birds, toucans, a large swift, and various warblers and other small kinds. The upper limit of human settlement, with cultivation of colocasia and beans, has been placed at 6700 ft.

Attempts have been made to identify the range with the "Mountains of the Moon" of Ptolemy and other ancient writers, the snows of which were thought to feed the Nile lakes. But in view of the extreme vagueness of the statements and the absence of all detailed knowledge of the geography, it is far more likely that the rumours of snowy mountains really referred to Mounts Kenya and Kilimanjaro, especially as they seem to have been obtained rather from the east coast than from the direction of the Nile. In modern times the existence of a snow-covered range in this part of Africa was first made known by Sir Henry Stanley during the Emin Pasha relief expedition of 1883-90, though hints of high mountains had been obtained by Stanley himself and by Romolo Cesati in 1876 and by others from the neighbourhood of the Albert Nyanza. Stanley named the main mass Ruwenzori, and oulying eastern peaks he called Mt. Gordon Bennett, Mt. Lawson, Mt. Edward Arnold, &c.—the last named lying N.E. of Lake Dweru. Subsequently Stanley's own name was given to the chief summit. One of Stanley's officers, Lieut. Stairs, ascended the western slopes to over 10,000 ft. in 1889, and partial ascents were afterwards made by Dr Stuhlmann, Mr Scott Elliot, Mr J. E. Moore, Sir Harry Johnston, Mr Douglas Freshfield, and others. Early in 1906 some of the secondary ridges above the snow-line were scaled by Messrs Grauer, Tegart and Maddox, and by Dr Wollaston and other members of the British Museum expedition, while later in the year the Duke of the Abruzzi led a well-equipped expedition, including various scientists, to the upper parts of the range, and with the help of trained Alpine guides ascended not only the culminating twin summits (which he named Margharita and Alexandra after the queens of Italy and England), but all the principal snow-clad peaks. The expedition produced for the first time a detailed map of the upper region, and threw much light on the geology and natural history of the range.

**RUYSBROEK** (or RUYSDAEL), JAN VAN (1293-1381), Dutch mystic, was born at Ruysbroek, near Brussels, in 1293. In 1317 he was ordained priest and became vicar of St Gudule, Brussels. When sixty years of age he withdrew with a few companions to the monastery of Groendael, near Waterloo, giving himself to meditation and mystical writing, and to a full share of the practical tasks of the society. He was known as the "Ecclesiastic Teacher," and formed a link between the Friends of God and the Brothers of the Common Life, sects which helped to bring about the Reformation. Ruysbroek insisted that "the soul finds God in its own depths," and noted three stages of progress in what he called "the spiritual ladder" of Christian attainment: (1) the active life, (2) the inward life, and (3) the contemplative life. He did not teach the fusion of the self in God, but held that at the summit of the ascent the soul still preserves its identity. His works, of which the most important were De vera contemptu et animatione, De septem gradibus amoris, were published in 1848 at Hanover; also Reflections from the Mirror of a Mystic (1906) and Die Zierde der geistlichen Hochzeit (1901).

See Rufus M. Jones, Studies in Mystical Religion, pp. 308-14 (1909); M. Maeterlinck, Ruysbroek and the Mystics, with selections from The Adornment of the Spiritual Marriage (tr. by J. T. Stoddart, London, 1894); and art. MYSTICISM.

**RUYSDAEL** (or RUYSBROEK), JACOB VAN (c. 1628-1682), the most celebrated of the Dutch landscapists, was born at Haarlem. He appears to have studied under his father Izak Ruysdael, a landscape painter, though other authorities make him the pupil of Berghem and of Albert van Everdingen. The earliest date that appears on his paintings and etchings is 1645. Three years later he was admitted a member of the guild of St Luke in Haarlem; in 1670 he obtained the freedom of the city of Amsterdam, and in 1668 his name appears there as a witness to the marriage of Hobbens. During his lifetime his works were little appreciated, and he seems to have suffered from poverty. In 1681 the sect of the Mennonites, with whom he was connected, petitioned the council of Haarlem for his admission into the almshouse of the town, and there the artist died on the 14th of March 1682.

The works of Ruysdael may be studied in the Louvre and the National Gallery, London, and in the collections at the Hague, Amsterdam, Berlin, and Dresden. His favourite subjects are simple woodland scenes, similar to those of Everdingen and Hobbens. He is especially noted as a painter of trees, and his rendering of foliage, particularly of oak leafage, is characterized by the greatest spirit and precision. His views of distant cities, such as that of Haarlem in the possession of the marquess of Habe, and that of Kutik in the Glasgow Corporation Gallery, indicate the influence of Rembrandt. He frequently paints coast-scenes and sea-pieces, but it is in his rendering of lonely bowly glades that we find him at his best. The subjects of certain of his mountain scenes seem to be taken from Norway, and have led to the supposition that he had travelled in that country. We have, however, no record of such a journey, and the works in question are probably merely adaptations from the landscapes of Van.
RYAN—RYAZAN

Everdingen, whose manner he copied at one period. Only a single architectural subject from his brush is known—an admirable interior of the New Church, Amsterdam, in the position of the stairs, which is perhaps the most typical of his landscapes is a full rich green, which, however, has darkened with time, while a clear grey tone is characteristic of his seacapes. The art of Ruysdael, while it shows little of the scientific knowledge of later landscapists, is sensitive and poetic in sentiment, and direct and skilful in technique. Figures are sparingly introduced into his compositions, and such as occur are believed to be from the pencilis of Adrian Vandevelde, Philip Wouwerman, and Jan Lingelbach.

Unlike the other great Dutch landscape painters, Ruysdael did not aim at a pictorial record of particular scenes, but he carefully thought out and arranged his compositions, introducing into them an infinite variety of subtle contrasts in the formation of the clouds, the plants and tree forms, and the play of light. He particularly excels in the painting of cloudy skies which are spanned dome-like over the landscape, and determine the light and shade of the objects.

Characteristic of his early period, from about 1646 to 1653, is the choice of very simple models and the careful and laborious study of details of nature. The time between his departure from Haarlem and his settling in Amsterdam may have been spent in travelling and helped him to gain a broader view of nature and to widen the horizon of his art. 'Mr Otto Beit owns a magnificent view of the ‘Castle of Bentheim,’ dated 1654, from which it may be concluded that his wanderings extended to Germany. In his last period, from about 1675 onwards, he shows a tendency towards overcrowded compositions, and affects a darker tonality, which may partly be due to the use of thin paint on a dark ground. Towards the end, in his leaning towards the romantic mood, he preferred to draw his inspiration from other masters, instead of going to nature direct, his favourite subjects being rushing torrents and waterfalls, and ruined castles on mountain crests, which are frequently borrowed from the Swiss views by Hoghman. A few minutes to Rouen against the light (1659) and Durand in 1878, with texts by Georges Duplessis. The ‘Cornfield’ and the ‘Travellers’ are characterized by M. Duplessis as prints of a high order which may be regarded as the most significant examples of landscape art in the Low Countries.

RYAN, Lacy (c. 1604–1756), English actor, appeared at the Haymarket about 1700. By 1718 he had joined the company at Lincoln’s Inn Fields, where he shared the lead with his friend Quin. In 1732 he followed the company to Covent Garden, and there he remained until his death. Ingo, Cassius, Edgar (in King Lear) and Macduff were among his best parts.

RYAZAN, a government of central Russia, bounded by the governments of Moscow and Tula on the W., by Vladimir on the N., and by Tambov on the E. and S., with an area of 16,250 sq. m. Ryazan is an intermediate link between the central Great Russian governments and the steppe governments of the S.E.—the wide and deep valley of the Oka being the natural boundary between the two. On the left of the Oka the surface often consists of sand, marshes and forests; while on the right the fertile black-earth prairies begin, occupying especially the districts of Ranenburg, Sapozhok and Dankov. The whole of Ryazan is a plateau about 700 ft. above the sea, but deeply cut by the river valleys and numerous rivulets. The Don belongs to Ryazan in its upper course only. On the whole, the S. districts are not well watered. Small lakes are numerous in the broad depression of the Oka and elsewhere, while extensive marshes occur in the N.E. districts; a few attempts at draining some of these beside the Oka have resulted in the reclaimation of excellent pasture lands. The climate is a little warmer than at Moscow, the average temperature at the city of Ryazan being 40°, February, 3°; July, 57°.

The estimated population in 1906 was 2,100,900, and is nearly Great Russian throughout, containing only a trilling admixture of Tatars, Poles and Jews in towns. Some Tatars immigrated into the Kasimov region in the 15th century, and are noted for their honesty of character and industry. The town and the provinces surrounding the capital, in which are located the villages of Ryazan, is chiefly a rich agricultural region, having 25,000 square miles of ploughable land, of which 70% is devoted to wheat, barley, buckwheat, flax, hemp, tobacco, hops and fruit. The crops are arranged to meet the needs of the inhabitants. Tobacco, hops, vegetables and fruit are exported. The vessels of the Pra river are described as Meshcheryaks, but their manners and customs do not differ from those of the Russians. The chief occupation is agriculture. Out of the total area only 8% is unfit for tillage, and between 50 and 60% is under crops; although the area under cultivation and the crops themselves are increasing, yet even here, in one of the wealthiest governments of Russia, the situation of the peasants is far from satisfactory. Live-stock breeding is rapidly falling off on account of want of pasture lands, but hay, which is abundant, especially on the rich meadow lands of the Oka, is exported. More than half of the land (52%) is owned by the village communities, 40% by private owners, 6% by the crown, and 2% by various institutions. During the last thirty years of the 15th century the nobles sold 36% (1,261,000 acres) of their lands, mainly to merchants and peasants; the latter cultivate two-thirds of the total cultivated area.

The principal crops are oats, rye and potatoes, with wheat, barley, buckwheat, flax, hemp, tobacco, hops and fruit. But the crops are insufficient to meet the needs of the inhabitants. Tobacco, hops, vegetables and fruit are exported. Beekeeping is developing and manufactures increasing, the factories being chiefly cotton and flax mills, flour mills, machine works, tanneries, soap works, boot, cement, glass and match factories, knitting and chewing tobacco factories.

The government is divided into twelve districts, the chief towns of which are Ryazan, Dankov, Egorievsk, Kasimov, Mikhailov, Pronsk, Ramenug, Ryazhsk, Sapozhok, Skopin, Spask and Zarinsk. Most industries, such as building, the preparation of pitch and tar, the making of wooden vessels and sledges, mat-weaving and boot-making, are carried on in the villages, especially in the N., which belongs, properly speaking, to the Vladimir industrial region. The local manufactures are: tobacco (supported by two schools) and embroidering on leather, giving occupation to 40,000 women. Trade, especially in corn and manufactured goods, is brisk, and has been stimulated by the opening of coal-mines, e.g. the district of Berezovsky, with 150,000 inhabitants, is plowed by the local governing bodies to increase the number of schools. Most interesting archaeological finds have been made in the government, and have been placed in the new museum at the city of Ryazan.

It is believed that the first known relics of the Oszy have been found here as early as the 9th century, penetrating thither both from the N. W. (Great Russians) and from the Dnieper (Little Russians). As early as the 10th century the principality of Muroum and Ryazan is mentioned in the chronicles. During the following centuries this principality increased both in extent and wealth, and included parts of what are now the governments of Kaluga and Moscow. Owing to the fertility of the soil, its Russian population rapidly increased, while the Finnish tribes which formerly inhabited it migrated farther E., or became merged among the Slavonic races, in the district of Ryazan, and in the oblast of Pronsk, the former is dotted with large villages, the bottom of a former lake, spreads out from the base of the cragon which Ryazan stands, and actually has the aspect of an immense lake when it is inundated in the spring. Ryazan is the see of an archbishop of the Orthodox Greek Church. The cathedral, first built in the 17th century, was reconstructed in 1776. The Krestovozdvizhensk church contains tombs of the princes of the 15th and 16th centuries.

The capital of Ryazan principality was Ryazan—now Old Ryazan, a village close to Spask, also on the Oka. It is mentioned in annals as early as 1097, but continued to be the chief town of the principality only until the 14th century. In the 11th century one of the Kiev princes founded, on the banks
of a small lake, a fort which received the name of Pereyaslavl-Ryazansky. In 1284 (or in 1335) the bishop of Muron, compelled to leave his town, settled in Pereyaslavl-Ryazansky. The princes of Ryazan followed his example, and by and by completely replaced the old republican town of Ryazan. In 1300 a congress of Russian princes was held there, and in the following year the town was taken by the Moscow prince. It continued, however, to be the residence of the Ryazan princes until 1517. In 1365 and 1577 it was plundered and burned by the Tatars, but in 1560, 1513, 1521 and 1564 it was strong enough to repel them. Earthen walls with towers were erected after 1301; and in the 17th century a kreml or citadel still stood on the high crag above the Trubezh.

**RYAZHSK,** a town of Russia, in the government of Ryazan, 72 m. by rail S. of the city of Ryazan. Pop. (1897) 12,993. It is one of the chief railway junctions of Russia, where meet the lines from Moscow to S. Russia and Caucasus and from Poland to Samara and Siberia. It has become a centre for all the corn-growing regions of Russia, and is a wealthy place.

**RYBINSK,** or Rybinsk, a town of Russia, in the government of Yaroslav, 60 m. by rail N.W. of Yaroslav. It is connected by rail (186 m.) with Bologoje, on the line between St. Petersburg and Moscow. It derives its importance from its situation on the Volga, opposite the mouth of the Sheksna, which connects the Volga with the regions around Lake Ladoga. Rybinsk has also an active trade in agricultural products from the neighbouring districts. The permanent population, which was 25,223 in 1897, is increased in the summer by nearly 100,000 workers from different parts of Russia.

**RYDBERG, ABRAHAM VIKTOR** (1828-1895), Swedish author and publicist, was born in Jönköping on 18th December 1828. He was educated at the high school of Växjö, and passed on to the university of Lund in 1851. While at school he was publishing verse and prose in the periodicals; some of these early miscellanies he collected in 1854 in the volumes called *Varia.* As a student he turned to more precise labours, and devoted himself to the task of learning German and adopting the profession of an engineer, when he was offered in 1855 a post on the staff of one of the largest Swedish newspapers. This caused his thoughts to return to imaginative literature, and it was in the feuilleton of this journal (the *Göteborgs Handels-och sjöfartstidning*) that Viktor Rydberg's romances successively appeared; he was editorially connected with it until 1876. *The Freebooter on the Baltic* (1857) and *The Last of the Athenians* (1859) gave Rydberg a place in the front rank of contemporary novelists. It was a surprise to his admirers to see him presently turn to theology, and *with The Bible's Teaching about Christ* (1862), in which the aspects of modern Biblical criticism were first placed before Swedish readers, he enjoyed a vast success. He followed this up by a number of contributions to the popular philosophy of religion, all inspired by the same reverence and yet searching spirit of inquiry. The modernity of his views led to his being opposed by the orthodox clergy, and by the writer public he was greatly esteemed. Nevertheless, it is said that it was his religious criticism which so long excluded him from the Swedish Academy, since he was not elected until 1877, when he had long been the first living author of Sweden. *Roman Days* is a series of archaeological essays on Italy (1876). He collected his poems in 1882; his version of *Faust* dates from 1876. In 1884 he was appointed professor of ecclesiastical history at Stockholm. He died, after a short illness, on the 22nd of September 1895.

In Viktor Rydberg Sweden possessed a writer of the first order, who carried on the tradition of Boström and Geijer in philosophy and history, and possessed in addition a glow of imagination and a marvellous charm of style. He was an idealist of the old romantic type which Sweden had known for three-quarters of a century; he was the last of that race, and perhaps, as a mere writer, the greatest. In personal character Rydberg was extremely like his writings—stately, ardent and ceremonious, with a fund of amiability which made him universally beloved. His premature death was the subject of national mourning, and had even a historical significance, for with him the old romantic influence in Swedish literature ceased to be paramount.

**RYDE,** a municipal borough and watering-place in the Isle of Wight, England, 5 m. S.S.W. of Portsmouth. Pop. (1901) 11,043. It is beautifully situated on rising ground on the N.E. coast, overlooking Spithead. It occupies the site of a village called La Rye or La Riche, which was destroyed by the French in the reign of Edward II. About the close of the 18th century it was a small fishing hamlet, but it rapidly grew into favour as a watering-place. Ryde is connected by rail with the other towns in the island, and there is also steamboat communication with Portsmouth, Southampton, Southsea, Portsea and Stoke's Bay. The pier, built originally in 1812, but since then greatly extended, forms a delightful promenade half a mile in length. The railway trains run out to its head, and an electric tramway also runs along it. The principal buildings are All Saints church, erected in 1870 from the designs of Sir Gilbert Scott, and other churches, the market house and town hall, the Royal Victoria Yacht club-house, the theatre and the Royal Isle of Wight Infirmary. There are golf-links near the town. The town was incorporated in 1868, and is governed by a mayor, 6 aldermen and 18 councillors. Area, 819 acres.

**RYE,** a market town and municipal borough in the county of Sussex, England, 12 m. N.E. by E. from Hastings, on the South-Eastern & Chatham railway. Pop. (1901) 3900. It rises on a sharp eminence above the t. of Romney Marsh, which within historic times was an inlet of the English Channel. The sea began to recede in the 16th century, and now the river Rother forms a small estuary with its mouth 2 m. from the town; this serves as a small harbour with a depth of 15 ft. at high tide, and there is some trade in coal, grain and timber. Fishing and shipbuilding are carried on, and there is a market for sheep (which are pastured in great numbers on the marshes), wool, grain and hops. The church of St Mary is of mixed architecture, chiefly Transitional, Norman and Early English; it is cruciform, with a low central tower. Of the old fortifications there remain portions of the town wall, a strong quadrangular tower built by William of Ypres, earl of Kent, and lord warden in the time of Stephen, and now forming part of the police station, and a handsome gate with a round tower on each side, known as the Land Gate, at the entrance into Rye from the London road. Picturesque old houses are numerous. In the lower S. of the town stands the castle, one of the coastal defenses works of Henry VIII. In the vicinity are golf-links, to which a steam tram runs from the town. The municipal borough is under a mayor, 4 aldermen and 12 councillors. Area, 985 acres.

In the time of Edward the Confessor, Rye (Ria, Ryecot, La Rie) was a fishing village and, as part of the manor of "Rameslie," was granted by the king to the abbot and convent of Fécamp, by whom it was retained until Henry III. resumed it. By 1086 Rye was probably a port of consequence, and a charter of Richard I. shows that in the reign of Henry II., if not before, it had been added to the Cinque Ports. The fluctuations of the sea and attacks of the French caused its decline in the 13th and 14th centuries, and the walls were therefore built in the reign of Edward III. The decay of Winchelsea contributed to the partial revival of Rye in the 15th and 16th centuries, when it was a chief port of passage. Towards the end of the 16th century the decay of the port began, and notwithstanding frequent attempts to improve the harbour it never recovered its ancient prosperity. Rye was incorporated under a mayor and jurats
by the beginning of the 14th century, but possesses no charter distinct from the Cinque Ports. As a member of the Cinque Ports, which were summoned from 1322 onwards, Rye returned two representatives to parliament from 1366 until 1832; after that date one only until 1885. In 1290 the barons of the royal port of Rye were granted a three days' fair in September, altered in 1305 to March. The mayor and commonalty evidently held weekly markets on Wednesday and Friday before 1405, as in that year the Friday market was changed to Saturday. Shipbuilding has been carried on since the 13th century.

**RYE.** This cereal, known botanically as *Secale cereale*, is supposed to be the cultivated form of *S. montanum*, a wild perennial species occurring in the more elevated districts of parts of the Mediterranean region, and W. to Central Asia. Its cultivation does not appear to have begun—

![Rye (Secale cereale), about 1/4 nat. size.](image)

1. single spikelet; 2. single flower with awned glumes and palea; 3. pistil; 4. grain. 1, 2, 4, about two-thirds nat. size.

cultivation of the plant then, as now, in those regions. The origin of the Latin name *secale*, which exists in a modified form among the Basques and Bretons, is not explained. Rye is a tall-growing annual grass, with fibrous roots, flat, narrow, ribbon-like bluish-green leaves, and erect or decurved cylindrical slender spikes like those of barley. The spikelets contain two or three flowers, of which the uppermost is usually imperfect. The outer glumes are acute and glabrous, the flowering glumes lance-shaped, with a comb-like keel at the back, and the outer or lower one prolonged at the apex into a very long bristly awn. Within these are three stamens surrounding a compressed ovary, with two feathery stigmas. When ripe, the grain is of an elongated oval form, with a few hairs at the summit. When the ovaries of the plant become affected with a peculiar fungus (*Claviceps purpurea*) they become blackened and distorted, constituting ergot (q.v.).

In the S. of Great Britain rye is chiefly or solely cultivated as a forage-plant for cattle and horses, being usually sown in autumn for spring use, after the crop of roots, turnips, &c., is exhausted, and before the clover and lucerne are ready. For forage purposes it is best to cut early, before the leaves and baulms have been exhausted of their supplies to benefit the grain. In the N. of Europe, and more especially in Scandinavia, Russia and part of N. Germany, rye is the principal cereal; and in nutritive value, as measured by the amount of gluten it contains, it stands next to wheat, a fact which furnishes the explanation of its culture in N. latitudes ill-suited for the growth of wheat. Rye bread or black bread is in general use in N. Europe. The straw, which is prized on account of its length, is used for making hats and in the manufacture of paper. The bran is used for cattle-food and poltiques, and the grain in the distillery.
RYLSK—RYMER

Ryle was a strong supporter of the evangelical school. Among his later works are Christian Leaders of the Eighteenth Century (1869), Expository Thoughts on the Gospels (7 vols., 1856-60), Principles for Churchmen (1884). His second son, Herbert Edward Ryle (b. 1856), a distinguished Old Testament scholar, was made bishop of Exeter in 1901, and in 1903 bishop of Winchester.

RYLSK, a town of Russia, in the government of Kursk, 71 m. by rail W.S.W. of the town of Kursk. It is connected by a branch line with the Kursk-Kiev railway. Pop. (1897) 11,415. It has oil works, blast furnaces, and manufactories of soap and tallow, and an active trade in corn, hemp, and scythes imported from Austria. It was founded in the 9th century, and is frequently mentioned in the annals from 1152 onwards. Its cathedral was built in the 15th century.

RYMER, THOMAS (1641-1713). English historiographer royal, was the younger son of Ralph Rymmer, lord of the manor of Brafferton in Yorkshire, described by Clarendon as "possessed of a good mind," afterwards reprinted in Dryden's "Pseudo-Bishops" rising of 1663. Thomas was probably born at Yafforth Hall early in 1641, and was educated at a private school kept at Danby-Wiske by Thomas Smelt, a noted Royalist, with whom Rymmer was "a great favourite," and "well known for his great critical skill in human learning, especially in poetry and history."1

He was admitted as pensionarius minor at Sidney Sussex College, Cambridge, on April 29, 1658, but left the university without taking a degree. On May 2, 1666, he became a member of Gray's Inn, and was called to the bar on June 16, 1673. His first appearance in print was as translator of Cicero's Prince (1668), from the Latin treatise (1608) drawn up for Prince Henry. He also translated Rapan's Reflections on Aristotle's Treatise of Poetics (1674), with a preface in defence of the classical rules for unity in the drama, and followed the principles there set forth in a tragedy in verse, licensed September 13, 1677, called Edgar. The English Mime: or, scenes of action, was published at London in 1678. The printed editions of 1678, 1691, and 1693 belong to the same issue, with new title-pages. Rymmer's views on the drama were again given in the world in the shape of a printed letter to Fleetwood Sheppard, the friend of Prior, under the title of The Tragedies of the Last Age Consider'd (1678, 2nd ed. 1692). To Ovid's Epistles Translated by Several Hands (1680), with preface by Dryden, "Penelope to Ulysses" was contributed by Rymmer, who was also one of the "hands" who "Englished" the Plutarch of 1683-86. The life of Nicias fell to his share. He furnished a preface to Whitelocke's Memorials of English Affairs (1682), and wrote in 1681 A General Draught and Prospect of the Government of Europe, reprinted in 1689 and 1714 as Of the Antiquity, Power, and Decay of Parliaments, where, ignorant of his future dignity, the critic had the misfortune to observe, "You are not to expect truth from an historiographer royal." He contributed three pieces to the collection of Poems to the Memory of Edmund Waller, published by the Society of Antiquaries (1683) as the Best of Three Pieces, and is said to have written the Latin inscription on Waller's monument in Beaconsfield churchyard. The preface to the posthuma Historia Ecclesiastica (1688) of Thomas Hobbes is said to have been by Rymmer, but the Life of Hobbes (1681) sometimes ascribed to him was written by Richard Blackburne. He produced a congratulatory poem upon the arrival of Queen Mary in 1689. His next piece of authorship was to translate the sixth elegy of the third book of Ovid's Tristia for Dryden's Miscellany Poems (1692, p. 148). On the death of Thomas Shadwell in 1692 Rymmer received the appointment of historiographer royal, at a yearly salary of £200. Immediately afterwards appeared his much discussed Short View of Tragedy (1693), criticizing Shakespeare and Ben Jonson, which produced The Imperial Critic (1693) of Dennis, the epigram of Dryden,2 and the judgment of Macaulay that Rymmer was "the 1 Sir John SS. Linnell, The Third Miscellany, in Works (1821), xii. p. 49, which is much more pointed than Beaconsfield's reference to critics as "men who have failed in literature and art" (Lothair, chap. xxxvii), or Balzac's scathing hit at Mme. de Sévasis in similar terms. The poet's remarks on the worst critic that ever lived." John Dunton (Life and Letters, p. 354), however, considered him "orthodox and modest," and Pope "one of the best critics we ever had" (Spence's Anecdotes). Rymmer contended that although Shakespeare possessed humour he had no genius for tragedy, Othello being merely "a bloody farce without salt or savour."

Within eight months of his official appointment Rymmer was directed (August 26, 1693) to carry out that great national undertaking with which his name will always be honourably connected, and of which there is reason to believe that Lords Somers and Halifax were the original promoters. The Codex Juris Gentium Diplomaticus (1693) of Leibnitz was taken by the editor as the model of the Foedera. The plan was to publish all records of alliances and other transactions in which England was concerned with foreign powers from 1101 to the time of publication, limiting the collection to original documents in the royal archives and the great national libraries. Unfortunately, this was not uniformly carried out, and the work contains some extracts from printed chronicles. From 1694 he corresponded with Leibnitz, by whom he was greatly influenced with respect to the plan and formation of the Foedera. While collecting materials, Rymmer unwisely engraved a spurious charter of King Malcolm, acknowledging that Scotland was held in homage from Edward the Confessor. When this came to be known the Scottish antiquaries were extremely indignant. G. Redpath published a MS. on the independence of the Scottish crown, by Sir T. Craig, entitled Scotland's Sovereignty Asserted (1693), and the subject was referred to by Bishop Nicolson in his Scottish Historical Library (1702). This led Rymmer to address three Letters to the Bishop of Carlisle (1702-1706) explaining his action, and discussing other antiquarian matters. Sir Robert Sibbald answered the second letter (1704). The first and second letters are usually found together; the third is extremely rare. Rymmer had now been for some years working with great industry, but had never received his due. In a letter of petition the crown offered him money for carrying on the undertaking. Up to August 1696, he had expended £2,253, and had only received £500 on account.

At last, on November 20, 1704, was issued the first folio volume of the Foedera, Conventiones, Litterae et ejusdem generis Acta Publica inter reges Angliae et alias quosvis imperatorum, regum, &c., ab a.d. 1101 ad nostro usque tempora habita aut tractata. The publication proceeded with great rapidity, and fifteen volumes were brought out by Rymmer in nine years. Two hundred and fifty copies were printed; but, as nearly all of them were presented to persons of distinction, the work soon became so scarce that it was priced by booksellers at one hundred guineas. A hundred and twenty sheets of the fifteenth volume and the copy for the remainder were burnt at a fire at William Bowyer's, the printer, on January 30, 1712-13. Rymmer died shortly after the appearance of this volume, but he had prepared materials for carrying the work down to the end of the reign of James I. The Journal was reprinted in the hands of Robert Sanderson, his assistant.

For the greater part of his life Rymmer derived his chief subsistence from a mortgage assigned to him by his father. His miscellaneous literary work could not have been very profitable. At one time he was reduced to offer his MSS. for a new edition for sale to the earl of Oxford. About 1703 his affairs became more settled, and he afterwards regularly received his salary as historiographer, besides an additional £200 a year as editor of the Foedera. Twenty-five copies of each volume were also allotted to him. He died at Arundel Street, Strand, December 14, 1713, and was buried in the church of St Clement Danes. His will was dated July 10, 1713. Tonson issued an edition of Rochester's Works (1714), with a short preface by the late historiographer. Another posthumous publication was in a miscellaneous collection called Curious Amusements, by M. B. (1741), which included some translations from Greek, Latin and Italian poets, by T. Traquair of the Last Angove have been rejected by critics as "poetry of the first order." He was born at York in 1666 (q.v.), pp. 383-396, and in Johnson's Life of Dryden. See also Dryden's Works, i. 377. vi. 251. xi. 60. xiii. 20. "I never came across a worse critic than Thomas Rymer," says Prof. George Saintsbury, who discusses his theories at length in History of Criticism (1902), pp. 491-397. See also A. Hollen, T. Rymer's dramatical Kritik (1908).
Rymer. Some of his poetical pieces were also inserted in J. Nicholls's *Select Collection* (1780-86, 8 vols.), and two are reproduced in A. H. Bullen's *Musæ Praeteritæ* (1853).

Two more volumes of the *Foedera* were issued by Sanderson in 1715 and 1719, and there was a new issue in 1768 by Philips, with the epitome, but upon a slightly different plan, in 1726-35. The latter volumes were published by Tonson, all the former by Churchill. Under Rymer it was carried down to 1586, and continued by Sanderson to 1654. The rarity and importance of the work to historians caused it to be collected and published in the *English constitutional history* of the predecessor of *Rymer's Foedera*, issued by Tonson in 1730, and on the whole the second is an improvement upon the first edition. A third edition, embodying Holmes's collection, was commenced at the Hague in 1737, and finished in 1745. It is in smaller type than the others, and is compressed within ten folio volumes. The arrangement is rather more convenient; there is some additional matter; the index is better; the type is not so good, but it is to be preferred to either of the previous editions. When the volumes of the *Foedera* first appeared they were analysed by Leclerc and Rapin in the *Bibliothèque choisie* and *Bibl. de l'Acad. roy. des Sciences*. Robert's edition, issued in 1853, was ultimately followed in 1869. A general introduction to the *Foedera* was issued by the Record Commission in 1817-40.

The wide learning and untiring labours of Rymer have received the highest praise from historians. His industry was praised by Hearne (*Collections*, ii. 296). Sir T. D. Hardy styles the *Foedera* a "work of which this nation has every reason to be proud, for with all its blemishes—and what work is faultless?—it has no rival in its class." (*Syllabus*, vol. ii. xxxvi.). Mr J. B. Mullinger calls it "a collection of the highest value and authority" (*Gardiner and Mullinger's Introduction to English History*, p. 224).

The best account of Rymer is to be found in the prefaces to Sir T. D. Hardy's *Syllabus* (1869-85, 3 vols. 8vo). There is an unexplained life of Rymer in J. F. Neilson's *Life of Sir Robert Caley*, and a few memoranda in Bishop Kennet's editions (Lond. MS. No. 987). See also *Dict. Nat. Biogr.* vol. i. In Cailfueld's *Portraits*, &c. (1819), i. 50, may be seen an engraving of Rymer, with a description of a satirical print of him as "a garretter poet." Rymer's two criticisms of the drama are discussed by Sir T. N. Tallourd in the *Retrospective Review* (1820), vol. i. pp. 1-15.

Sir T. D. Hardy's *Syllabus* gives in English a condensed notice of each instrument in the several editions of the *Foedera*, arranged in chronological order. The third volume contains a catalogue of names and places, with a catalogue of the volumes of transcripts collected for the Record edition of the *Foedera*. In 1869 the Record Office printed, for private distribution, Appendices A to E to a report on the *Foedera* intended to have been submitted by C. F. Coote to the Commission on the Records, including accounts of MSS. in foreign archives relating to Great Britain, with facsimiles. In the British Museum is preserved (Add. MS. 24960) a complete volume of samples and papers relating to the Rymer *Foedera* in the office of acting extensive materials for a new edition of the *Foedera*, bound in 59 folio volumes, in the period from 1115 to 1668. This was the collection offered to the earl of Oxford. It was purchased by the Treasury for £215 from a Mrs Anna Parnell, to whom Rymer left all his property, and is now in the Bentinck Library. MS. 24960 contains a list of the names of the authors and the years in which they wrote, with a catalogue of the 59 volumes of a new edition, and the transcripts collected for the new and unfinished edition. (H. R. T.)

**RYOT** or **RAYAT** (from the Arabic ra’a, “to pasture”), properly a subject, then a tenant of the soil. The word is used throughout India for the general body of cultivators; but it has a special meaning in different provinces. The ryotwari tenure is one of the two main revenue systems in India. Where the land revenue is imposed on an individual or community owning an estate, and occupying a position analogous to that of a landlord, the assessment is known as zamindari; and where the land revenue is imposed on individuals who are the actual occupants, the assessment is known as ryotwari. Under zamindari tenure the land is held as independent property; while under ryotwari tenure it is held in the crown in a right of occupancy, which is under British rule both heritable and transferable. The former system prevails in northern and central India, and the latter in Bombay, Madras, Assam and Burma.

**RYSWICK, TREATY OF**, the peace which in 1697 ended the war between France on the one side and the Empire, England, Spain and Holland, on the other. Begun in 1689 under the leadership of the new king of England, William III., its object was to put a check on the ambitious designs of Louis XIV., and it raged in the Netherlands, the Rhine, Italy, Ireland and Spain, in India and America and on the sea (see Grand Alliance, War of the). Negotiations for peace began in 1696, but they were soon broken off, William III. and the English parliament at this time refusing to treat except “with our swords in our hands.” But in May 1697 they were renewed under the mediation of the king of Sweden. The French representatives had their headquarters at the Hague and the allies at Delft, the conferences between them taking place at Ryswick. For the first few weeks no result was reached, and in June William III. and Louis XIV., the protagonists in the struggle, each appointed one representative to meet together privately. The two chosen were William Bentinck, earl of Portland, and marshal Boufflers, and they soon drew up the terms of an agreement, to which, however, the emperor Leopold I. and the king of Spain would not assent. But in a short time Spain gave way, and on the 20th of September 1697 a treaty of peace was signed between France and the three powers, England, Spain and Holland, the Empire still holding aloof. William then persuaded Leopold to make peace, and a treaty between France and the Empire was signed on the 30th of October following.

The basis of the peace was that all towns and districts seized since the treaty of Nijmegen in 1679 should be restored. Then France surrendered Freiburg, Breisach and Philippensburg to Germany, although she kept Strassburg. On the other hand, she regained Pondicherry and Nova Scotia, while Spain recovered Catalonia, and the barrier fortresses of Mons, Luxemburg and Courtrai. The duchy of Lorraine, which for many years had been ceded to France in possession of France, was restored to Leopold Joseph, a son of duke Charles V., and the Dutch were to be allowed to garrison some of the chief fortresses in the Netherlands, including Namur and Ypres. Louis undertook to recognize William as king of England, and promised to give no further assistance to James II.; he abandoned his interference in the electorate of Cologne and also the claim which he had put forward to some of the lands of the Rhenish Palatinate.

the twenty-first letter of the Phyocian alphabet, contains the four of the sibillans which that alphabet possesses. In the Phyocian alphabet it takes a form closely resembling the English W, and this when moved through an angle of 90° is the ordinary Greek sigma $\Sigma$. In Phyocian itself and in the other Semitic alphabets the position of the middle legs of the W is altered so that the symbol takes such forms as $\nu$, or $\nu$, or $\omega$, ultimately ending sometimes in a form like $\kappa$ laid sideways $\nu$. In Greek, where $\Sigma$ is the twentieth letter of the alphabet, or, if the merely numerical $\varsigma$ and $\xi$ are excluded, the eighteenth, another form $\zeta$ or $\xi$ according to the direction of the writing is also widespread. This, which is the only form of the earliest period at Cumae, where it is also found more rounded $\xi$, is the origin of the Latin S and its descendants. The development from the angular to the curved shape of S may be seen in its occurrences on the early cippus found in the Roman Forum in 1899. Apart from doubtful instances it is there six times clearly engraved; four of the instances are angular, the other two are more or less rounded. The Semitic name of the symbol is shin; the Greek name sigma may mean merely the hinging letter and may be a genuine Greek derivative from the verb οἶκω, hias. Some, however, see it in a corruption of the Semitic name $santekh$, the letter which corresponds in alphabetic position and in shape to the Greek $\xi$. The Dorian Greeks, however, as Herodotus calls them (i. 139), called that letter $\sigma$ the Ionian Greeks called $\sigma$; $\varsigma$ seems more likely to be an attempt to reproduce the Semitic name. Herodotus says nothing of a difference in shape, but most authorities regard the form $\Delta$, which with the value of $\varsigma$ is practically confined to Doric areas, as being $\varsigma$. In the compound $\sigma\mu\rho\omega\pi\alpha\varsigma$, $\varsigma$ like koppa ($\kappa\omega\rho\alpha\gamma\varsigma$) was known to the Athenians as a brand for higghed horses (cf. Aristophanes, Clouds, 122, 1298, 23, 438). For the symbol T which was used at Ephesus and other places in Asia Minor and elsewhere for the sound represented by $\sigma\alpha$ in Ionic Greek, by $\tau\tau$ in Attic, see ALPHABET. Further points of difficulty in connexion with the sibillans are discussed under X and Z. The pronunciation of $\varsigma$ was originally unvoiced: in English it is often used for the voiced sound as well, compare lose with loose, house with houses. At the end of words the voiced sound is often written with $\varsigma$, the unvoiced with $\varsigma$ as in his and hiss. In other cases the pronunciation can be ascertained only from the context, as in unse, unvoiced for the substantive, voiced for the verb. Sometimes a difference of meaning is indicated by difference of spelling though the sounds in the two words are identical, as in furs and furse. The voiced form of $\varsigma$ (i.e. $\varsigma$) readily passes into $\tau$ in many languages: compare the Eng. ear with the Ger. Ohr, the Eng. ear and Lat. auris with the Gothic auro and Lithuanian ausis, “ear”. Here also should be mentioned the sound sh, which, like th, is not a combination of sounds though written with two symbols. Hence in transcription from foreign languages and in works on phonetics it is represented by $\varsigma$ or $\varsigma$. The difference in formation between $\varsigma$ and $\varsigma$ is that the former is dental or alveolar, the latter is produced farther back and has at least two varieties. In the usual Eng. sh the tip of the tongue is bent backwards so that the tongue becomes spoon-shaped. The voiced sound to this is generally written $\varsigma$ or $\varsigma$, but sometimes $\varsigma$ as in pleasure. The sound of $\varsigma$ is also sometimes represented by $\varsigma$, as in sure, sugar. This is occasioned by the y-sound with which it now begins, and is carried further in dialect than in the literary language. shue and you, for example, being pronounced in Scotland like the Eng. shoe and shoot. The $\varsigma$ sound is sometimes not even written with a sibilant, as in the pronunciation of the ci and ti of words like rhotician and nation.

SAALE, a river of Germany, a tributary of the Elbe, rises between Bayreuth and Hof in the N.E. of Bavaria, springing out of the Fichtelgebirge at an altitude of 2390 ft. It pursues a winding course in a northerly direction, and after passing the manufacturing town of Hof, flows amid well-wooded hills until it reaches the pleasant vale of Saalburg. Here it receives the waters of the Schwarza, in whose romantic valley lies the castle of Schwarzenburg, the ancestral seat of the princes of the ruling house of Schwarzenburg-Rudolstadt. From Saalburg the Saale enters the dreary limestone formation of Thuringia, sweeps beneath the barren, conical hills lying opposite to the university town of Jena, passes the pleasant watering-place of Kösen, washes numerous vine-clad hills and, after receiving at Naumburg the deep and navigable Unstrut, flows past Weissenfels, Merseburg, Halberstadt, and joins the Elbe just above Barby, after traversing a distance of 226 m. It is navigable from Naumburg, 100 m., with the help of sluices, and is connected with the Elster near Leipzig by a canal. The soil of the lower part of its valley is of exceptional fertility, and produces, amongst other crops, large supplies of sugar beetroot. Amongst its affluents are the Elster, Regnitz and Orla on the right bank, and the Ilm, Unstrut, Saale, Wipper and Bode on the left. Its upper course is rapid. Its valley, down to Merseburg, is picturesque, and even romantic, because of the many castles which crown the enclosing heights. It is sometimes called the Thuringian or Saxo-Saale, to distinguish it from another Saale (70 m. long), a right-bank tributary of the Main, in the Bavarian district of Lower Franconia.

See Hertzberg, Die historische Bedeutung des Saaleals (Halle, 1895).

SAALFELD, a town of Germany, in the duchy of Saxe-Meiningen, picturesquely situated on the left bank of the Saale, 24 m. S. of Weimar and 77 S.W. of Leipzig by rail. Pop. (1905) 13,740. One of the most ancient towns in Thuringia, Saalfeld, once the capital of the extinct duchy of Saxe-Saalfeld, is still partly surrounded by old walls and bastions, and contains some interesting medieval buildings, among them being a palace, built in 1679 on the site of the Benedictine abbey of St Peter, which was destroyed during the Peasants' War. Other notable edifices are the Gothic church of St John, dating from the beginning of the 13th century; the Gothic town hall, completed in 1537; and, standing on an eminence above the river, the Kitzenstein, a palace said to have been originally erected by the German king Henry I., although the present building is not older than the 16th century. But perhaps the most interesting relic of the past in Saalfeld is the striking ruin of the Hofer Schwan, called later the Sorbenburg, said to have been erected in the 7th century. Saalfeld is situated in one of the busiest parts of Meiningen and has a number of prosperous industries, including the manufacture of machinery, bricks, colours, malt, cigars, hosiery and vinegar. Other industries are brewing, printing and iron-founding, and there are ochre and iron mines in the neighbourhood.

Saalfeld grew up around the abbey founded in 1075 by Anno, archbishop of Cologne, and the palace built by the emperor Frederick I. In 1389 it was purchased by the landgrave of Thuringia, and with this district it formed part of Saxon. In 1680 it became the capital of a separate duchy, but in 1699 it was united with Saxe-Coburg, passing to Saxe-Meiningen in 1826. On the 10th of October 1860 a battle took place near Saalfeld between the French and the Prussians, during which Prince Louis Ferdinand of Prussia was killed.

See Wagner and Grobe, Chronik der Stadt Saalfeld (Saalfeld, 1865-1867), and Thümml, Kriegstage aus Saalfelds Vergangenheit (Berlin, 1882).

SAAR, a river of Germany, a right-bank tributary of the Mosel. It rises in the Donon, an eminence of the Voges, close to the Franco-German frontier, and flows at first north, then north-west and finally north again to its junction with the Mosel.
SAARBRÜCKEN—SAAVEDRA FAJARDO

at Konz. Its length is 143 m. The middle part of its valley is an important industrial district, with coal-mines and a variety of manufactures; the Saar wines are also well known. The principal towns on the Saar are Saargemünd, Saarbrücken and St Johann (which face each other across the river), Saarlouis and Saarburg. The river is navigable up to Saargemünd, a distance of 75 m. From here there is connexion with the Rhine-Marne canal by way of the Saar canal, built in 1862, and 40 m. in length, following the Saar valley upwards for about half that distance.

SAARBRÜCKEN, a town of Germany, in the Prussian Rhine Province, on the left bank of the Saar, a navigable tributary of the Mosel, is situated 40 m. by rail N.E. of Metz, at the south end of one of the most extensive coal-fields in Europe, to which it has given its name. Pop. (1885) 10,455; (1905) 26,944. With the towns of St Johann, immediately opposite on the right bank of the river, and Malstatt-Burbach, Saarbrücken forms a single community, the three places having been united in 1909. Saarbrücken has four Protestant churches, a Roman Catholic and an Old Catholic church, and a town hall adorned with paintings by Anton von Werner, illustrating episodes of the wars of 1870. Other buildings are the castle, until 1703 the residence of the princes of the house of Nassau-Saarbrücken; a gymnasium, founded in 1615, and a celebrated mining academy. The industries of St Johann-Saarbrücken include wool-spinning, brewing, and the manufacture of leather, tobacco, chemicals and iron wares. The trade is chiefly connected with the produce of the neighbouring coal-mines and that of the numerous important iron and glass works of the district. The Saarbrücken coal-fields extend over 70 sq. m., are estimated to yield about 10,000,000 tons annually, and give employment to nearly 50,000 men.

Saarbrücken owes its name to a bridge which existed in Roman times. Its early lords were the bishops of Metz, the counts of the lower Saargau, and the counts of the Ardenne. From 1381 to 1793 it belonged to the counts of Nassau-Saarbrücken, and then, after having been in the possession of France from 1801 to 1815, it passed to Prussia. In the Franco-Prussian War Saarbrücken was seized by the French on the 2nd of August 1870, but the first German victory on the heights of Spichern, 3 m. to the south, relieved it four days later.

See Köllner, Geschichte der Stadt Saarbrücken und St Johann (Saarbrücken, 1867); Ruppersburg, Geschichte der ehemaligen Grafschaft Saarbrücken (Saarbrücken, 1899-1903); and H. Kniebe, Bilder aus Saarbrücken's Vergangenheit (Saarbrücken, 1894).

SAARBURG, a town of Germany, in the imperial province of Alsace-Lorraine, on the Saar, 44 m. N.W. from Strassburg by rail. Pop. (1905) 9,818. Its chief industries are the manufacture of watch springs, gloves, lace, beer and machinery, and it has a trade in grain. Saarburg, which has been identified with the Pons Saravi of the Romans, belonged to France from 1661 to 1871, its earlier owners having been the bishops of Metz and the dukes of Lorraine.

Another Saarburg is a town in Prussia at the confluence of the Saar and the Leuk. Pop. (1905) 2,186. It has the ruins of a castle, formerly belonging to the electors of Trier, and is still partly surrounded by walls. It has manufactures of bells, furniture and cigars, other industries being tanning and vine-growing. Saarburg dates from the 10th century and received municipal rights in 1291. From 1036 until 1727, when it passed into the possession of France, it belonged to the electors of Trier. It became Prussian in 1815.

See Heuer, Geschichte der Burg und Stadt Saarburg (Trier, 1862).

SAARGEMÜNDB (Fr. Sarreguemines), a town of Germany, in the imperial province of Alsace-Lorraine, situated at the confluence of the Blies and the Saar, 40 m. E. of Metz, 60 m. of Strassburg by rail, and at the junction of lines to Trier and Saarburg. Pop. (1905) 14,032. It carries on considerable manufactures of finace, plush, velvet, leather, porcelain and earthenware, and is a chief depot for the paper-maché boxes, mostly snuff-boxes, which are made in great quantities in the neighbourhood.

Saargemünd, originally a Roman settlement, obtained civic rights early in the 13th century. In 1297 it was ceded by the count of Saarbrücken to the duke of Lorraine, and passed with Lorraine in 1766 to France, being transferred to Germany in 1810.

See Thomire, Notes historiques sur Sarreguemines (Strassburg, 1887); and Box, Notice sur le pays de la Saar (Nancy, 1903).

SAARLOUIS, a town and former fortress of Germany, in the Prussian Rhine Province, situated in a fertile district on the left bank of the Saar, and on the railway from Saarbrücken to Trier, 40 m. S. of the latter. Pop. (1905) 8,135. The town is well laid out and has spacious streets and a handsome market square. It contains a Roman Catholic and a Protestant church, a town hall, the halls of the council chamber in which are hung with Gobelins, the gift of Louis XIV., a classical school and a hospital. There are coal-mines in the vicinity, and the town has considerable manufactures of porcelain, enamel wares and leather, as well as a brick trade in cattle and grain.

Saarlouis was founded in 1681 by Louis XIV. of France, and was fortified by Vauban in 1689-1695. By the peace of Paris, in 1815, it was ceded to the allies and by them was made over to Prussia. The fortifications were dismantled in 1869. Marshal Ney was born here.

See Niessen, Geschichte des Kreises Saarlouis (Saarlouis, 1893 and 1897); and Balthzer, Historische Notizen über die Stadt Saarlouis (Trier, 1865).

SAAVEDRA, ANGEL DE, DUKE OF RIVAS (1791-1865), Spanish poet and politician, was born at Cordova on the 19th of March 1791. He fought in the war of independence, was a prominent member of the advanced Liberal party from 1820 to 1823, and in the latter year was condemned to death. He escaped to London and lived successively in Italy, Malta and France, until the amnesty of 1834, when he returned to Spain, shortly afterwards succeeding his brother as duke of Rivas. In 1835 he became minister of the interior under Isáriz, and along with his chief had again to leave the country. Returning in 1837, he joined the moderate party, became prime minister, and was subsequently ambassador at Paris and Naples. He died on the 22nd of June 1865. In 1833 he published Ensayos políticos, and between that date and his first exile several of his tragedies (the most notable being Alatar, 1814, and Lanuza, 1822) were put upon the stage. Traces of foreign influence are observable in El Moro Expósito (1833), a narrative poem dedicated to John Hookham Frere; these are still more marked in Don Alvaro o La Pura de sin (first played on the 22nd of March 1835), a drama of historical importance inasmuch as it established the new French romanticism in Spain.

See Köllner, Geschichte der Stadt Saarbrücken und St Johann (Saarbrücken, 1885); Kollner, Geschichete der ehemaligen Grafschaft Saarbrücken (Saarbrücken, 1899-1903); and H. Kniebe, Bilder aus Saarbrücken's Vergangenheit (Saarbrücken, 1894).

SAAVEDRA FAJARDO, DIEGO DE (1584-1648), diplomatist and man of letters, was born of a noble family at Algezares (Murcia) on the 6th of May 1584. Educated for the church at Salamanca, he took orders, and in 1606 was appointed secretary to Cardinal Gaspar Borgia, the Spanish ambassador at Rome. Ultimately he became Spanish plenipotentiary at Regensburg in 1636 and at Münster in 1645. He returned to Spain in 1646 and took up the post of member of the council of the Indies to which he had been nominated in 1636, but shortly afterwards retired to a monastery, where he died in 1648. In 1640 he published his Empresas políticas, ó idea de un principio político cristiano, a hundred short essays on the education of a prince; these were written primarily for the son of Philip IV. Its sententious style is still admired in Spain. It passed through a number of editions and was translated in several languages, the English version being by Astry (2 vols., 8vo, London, 1700). An unfinished historical work, entitled Corona gótica, castellana, y austríaca políticamente ilustrada, appeared in 1646. Another work ascribed to Saavedra, la República literaria, was published posthumously in 1670; it is a satirical discussion on some of the leading characters in the ancient and modern world of letters.
Collected editions of his works appeared at Antwerp in 1677-1678, and again at Madrid in 1789-1790; see also vol. xxv. of the Bibli. de aut. esp. (1853).

SAAZ (Czech Žatec), a town of Bohemia, Austria, 64 m. N.W. of Prague by rail. Pop. (1900) 16,168, mostly German. It lies on the Egér, which is spanned here by a suspension bridge, 210 ft. long, which is the oldest of its kind in Bohemia, having been constructed in 1826. It possesses several ancient churches, of which one is said to date from 1206, and a town hall built in 1559. Saaz is the centre of the extensive hop trade of the neighbourhood. In early times it was the seat of a royal count (Zupan or gojgraf). A coat-of-arms was given to the inhabitants by Ladislaus for their courage during the storming of Milan; and the place is mentioned as a royal town under Ottokar II. From the outbreak of the Hussite Wars to the Thirty Years' War Saaz was Hussite or Protestant, but after the battle of the White Mountain (1620) the greater part of the Bohemian inhabitants left the town, which became German and Roman Catholic.

SABADELL, a town of north-eastern Spain, in the province of Barcelona; on the river Ripoll and on the Barcelona-Sabadell railway. Pop. (1900) 23,294. The town has handsome modern public buildings, including the town hall, schools for primary and higher education, hospitals and theatres. Cloth, linen, paper, flour and brandy are manufactured, and there are iron foundries and saw-mills. About half the inhabitants are employed in the textile factories. Sabadell is said to be the Roman Sebendunum, but in Spanish annals it is not noticed until the 13th century.

SABAENS. The ancient name of the people of Yemen (q.v.) was Saba (Saba' with final humza); and the oldest notices of them are in the Hebrew Scriptures. The list of the sons of Joktan in Gen. x. 26-29 contains in genealogical form a record of peoples of South Arabia which must rest on good information from Yemen itself. Many of these names are found on the inscriptions or in the Arabic geographers—Sheba (Saba'), Haazarmaveth (Haḍramut), Abimeab (Abimeathar), Jobab (Yuhaitib, according to Halévy), Jerah (Wardî of the geographers), Joktan (Arab Qobān; waqāta=wqaqāta). On the other hand, the names of some famous nations mentioned on the inscriptions are lacking, from which it may be concluded that they did not rise to prominence till a later date. Saba' (Sheba) itself, which was in later times the chief name, has in Gen. x. 28 a subordinate place; it was perhaps only a collective name for the companies of merchants who conducted the South-Arabian export trade (the root sab' in the inscriptions meaning to make a trading journey), and in that case would be of such late origin as to hold one of the last places in a list that has genealogical form. Two other accounts in Genesis, originally independent, give supplementary information drawn from the Sabaean colonies, the stations and factories established to facilitate trade through the desert. The inscriptions of Al-Ola published by D. H. Müller show that there were Minean colonies in North Arabia. Other South Arabs, and especially the Sabaens, doubtless also planted settlers on the northern trade routes, who in process of time united into one community with their North-Arab kinsmen and neighbours. Thus we can understand how in Gen. xxv. 2-3 Sheba and Dedan appear among the North-Arab "sons of Keturah." Again, the Sabaens had colonies in Africa and there mingled with the black Africans; and so in Gen. x. 7 Sheba and Dedan, the sons of Raamah (Raghma), appear in the genealogy of the Cushites. With the Ethiopians Saba' means "men," a clear indication of their Sabaean descent. The queen of Sheba who visited Solomon may have come with a caravan trading to Gaza, to see the great king whose ships plied on the Red Sea. The other biblical books do not mention the Sabaens except incidentally, in allusion to their trade in incense and perfumes, gold and precious stones, ivory, ebony, and costly garments (Jer. vi. 20; Ezek. xxvii. 15, 20, 22 seq.; Isa. lx. 6; Job vi. 10). These passages attest the wealth and trading importance of Saba from the days of Solomon to those of Cyrus. When the prologue to Job speaks of plundering Sabaens (and Chaldaea) on the northern skirts of Arabia, these may be either colonists or caravans, which, like the old Phoenician and Greek traders, combined on occasion robbery with trade. The prologue may not be historical; but it is to be presumed that it deals with historical possibilities, and is good evidence thus far.

The biblical picture of the Sabaean kingdom is confirmed and supplemented by the Assyrian inscriptions. Tiglath-Pileser II. (733 B.C.) tells us that Teima, Saba', and Ḥaippā ( Ephah, Gen. xxv. 4 and Isa. lx. 6) paid him tribute of gold, silver and much incense. Similarly Sargon (715 B.C.) in his Annals mentions the tribute of Shamsi, queen of Arabia, and of Itamarra of the land of Saba'—gold and fragrant spices, horses and camels.

The earliest Greek accounts of the Sabaens and other South-Arabian peoples are of the 3rd century B.C. Eratosthenes (276-194 B.C.) in Strabo (xv. 4. 2) says that the extreme south of Arabia, over against Ethiopia, is inhabited by four great nations—the Mineans (Meuva'os, Myva'os; Ma'ln of the inscriptions) on the Red Sea, whose chief city is Carna; next come the Sabaeans, whose capital is Marib (Mariab of the inscriptions); then the Catabanes (Qatabān of the inscriptions), near the Straits of Bab-el-Mandeb, the seat of whose king is Tamra; fourthly, and farthest east, the people of Ḥadramut (Chathamotitae), with their city Sabota. The Catabanes produce frankincense and Ḥadramut myrrh, and there is a trade in these and other spices with merchants who make the journey from Aelana (Elath, on the Gulf of 'Akaba) to Minea in seventy days; the Gabaens (the Gaba'ān of the inscriptions, Pliny's Gebanitae) take forty days to go to Ḥadramut. This short but important and well-informed notice is followed a little later by that of Agatharchides (120 B.C.), who speaks in glowing terms of the wealth and greatness of the Sabaens, but seems to have less exact information than Eratosthenes. He knows only the Sabaens and thinks that Saba is the name of their capital. He mentions, however, the "happy islands" beyond the straits, the station of the Indian trade (§ 103). Arthemidorus (100 B.C.), quoted by Strabo, gives a similar account of the Sabaens and the capital Marib, of their wealth and trade, adding the characteristic feature that each tribe receives the wares and passes them on to its neighbours as far as Syria and Mesopotamia.

The accounts of the wealth of the Sabaens brought back by traders and travellers excited the curiosity of Rome, and Augustus entrusted Aelius Gallus with an expedition to South Arabia, of which we have an authentic account in Strabo (xvi. 4. 22). He hoped for assistance from the friendly Nabataeans; but, as they owed everything to their position as middlemen for the South-Arabian trade, which a direct communication between Rome and the Sabaens would have ruined, their viceroy Syllaecus, who did not dare openly to refuse help, sought to frustrate the emperor's scheme by craft. Instead of showing the Romans the caravan route, he induced them to sail from Cleopatris to Leucoum, and then led them by a circuitous way through waterless regions, so that they reached South Arabia too much weakened to effect anything. But the expedition brought back a considerable knowledge of the country and its products, and the Roman leader seems to have perceived that the best entrance to South Arabia was from the havens on the coast. So at least we may conclude when, a hundred years later (A.D. 77, as Dillmann has shown), in the Periplus of an anonymous contemporary of Pliny (§ 23) we read that Charibael of Zafar, "the legitimate sovereign of two nations, the Homerites and Sabaens," maintained friendly relations with Rome by frequent embassies and gifts. Pliny's account of Yemen, too, must be largely drawn from the expedition of Gallus, though he also used itineraries of travellers to India, like the Periplus Maris Erythraei just quoted.

Nautical improvements, and the discovery that the south-west monsoon (Hippalus) gave sure navigation at certain seasons, increased the connexion of the West with South Arabia, but also wrought such a change in the trade as involved a revolution in the state of that country. The hegemony of the Sabaens...
The Sabaeans in Africa have been already mentioned. That Abyssinia was peopled from South Arabia is proved by its language and writing; but the difference between the two languages is such as to imply that the settlement was very early and that there were many centuries of separation, during which the Abyssinians were exposed to foreign influences. New colonies, however, seem to have had time to come in and assimilate the Sabaeans or Sabaeans, brought back the information on which Claudius Ptolemy constructed his map, which still surprises us by its wealth of geographical names.

The three Minea citadels lie nearly in this position (H.), with old Minea settlements (Raiam) all round them, and even with some Minea places (e.g. Nask and Kamna) within the triangle they form. The dialect of the Mineans is sharply distinguished from those of the Nabataeans. At Hadramut there are twenty-seven Minean kings, who were quite independent, and, as it would seem, not always friends of the Mineans, for neither dynasty mentions the other in its inscriptions, while minor kings and governors are commonly mentioned. The Minean inscriptions show that the Mineans stood under the protection of the one or the other respectively. The Mineans were evidently active rivals of the Sabaeans, and a war between the two is once mentioned. In Hadramut they disputed the hegemony with one another at one time under a Minean, at another under a Sabaean prince, while the language shows now the one and now the other influence. The religions also of the two powers present many points of contact, but there is not much agreement as to the facts, as the fact appears, it is clear that the Mineans formed a sort of political and linguistic island in the Sabean country. The origin of the Mineans from Hadramut is rendered probable by the preceding account of their language, and the Minean inscriptions, found at both, show that both were a Minean and a Sabean inscriptions are named in the Koran—Wadd, Yaghuth and Nasr. In the god-name Ta'lab there may be an indication of the worship. The Mineans may be considered as the Sabaeans, and we must mention the San'a territory, which is now inhabited by the Mineans, who have preserved their name, and are a race of farmers. The Mineans are also distinguished by their black skin. The Mineans lived in small settlements, and were not a warlike people. They were not a seafaring people, but had a few ships, and traded with the Sabaeans. The Mineans were not a rich people, and they were not a powerful people. They were a simple people, and they were not a learned people. They were not a religious people, and they were not a powerful people. They were not a warlike people, and they were not a powerful people.
SABAKI—see D.

SABAZIUS, a Phrygian or Thracian deity, frequently identified with Dionysus, sometimes (but less frequently) with Zeus. His worship was closely connected with that of the great mother Cybele and of Attis. His chief attribute as a chthonian god was a snake, the symbol of the yearly renovation of the life of nature. Moeris (De corona, p. 313) mentions various ceremonies practised during the celebration of the mysteries of Bacchus. He was not passing off a golden snake under the clothes of the initiated across their bosom and its withdrawal from below—an old rite of adoption. From Val. Max. i. 3, 2 it has been concluded that Sabazius was identified in ancient times with the Jewish Sabaoth (Zebaoth). Plutarch (Symp. iv. 6) maintains that the Jews worshipped Dionysus, and that the day of Sabbath was a festival of Bacchus. Whether he was the same as Sozon, a marine deity of southern Asia Minor, is doubtful. Some explain the name as the "beer god," from an Illyrian word sabaya, while others suggest a connexion with *Σαον* (god of "health") or *σάθης*. His image and name are often found on "votive hands," a kind of taissian adorned with emblems, the nature of which is obscure. His ritual and mysteries (*Saca Savaidia*) gained a firm footing in Rome during the 2nd century A.D., although as early as 139 B.C. the first Jews who settled in the capital were expelled by virtue of a law which proscribed the propagation of the cult of Jupiter Sabazius.

SABBATAI SEBI—SABBATH

SABBATAI SEBI (1626–1676). Jewish mystic, whose Messianic claims produced an unparalleled sensation throughout the world, was born in Smyrna. He was of Spanish descent and was gifted with a personality of rare fascination. As a lad he was attracted by the mysticism of Luria (r.q.), which impelled him to adopt the ascetic life. He passed his days and nights in a condition of ecstasy. He began to dream of the fulfilment of Messianic hopes, of the return of the Jews to Jerusalem, and of the conversion of Spain and France. He asserted, possibly guided by Christian visions, that he was the Messiah and that many of the victims of a terrible wrong. Yet many continued to believe in him, as he from time to time attempted to resume his rôle. In 1676 he died in obscurity in Albania. A sect of Sabbateans—the Dormeh of Salonica—survived him, and for many a long year the controversy for and against his claims left an echo in Jewish life.

The literature on the life and career of this remarkable man is very extensive. Sabbatai Sebi figures largely in English books of the period. A valuable account is given in particular by Graetz, History of the Jews, vol. v. ch. iv. Zangwill has a brilliant sketch of Sabbatai’s career in his Dreamers of the Ghetto. (I. A.)

SABBATH, the day of cessation from work,1 which among the Hebrews followed six days of labour and closed the week.

1. Observance.—The later Jewish Sabbath, observed in accordance with the rules of the Scribes, was a very peculiar institution, and formed one of the most marked distinctions between the Hebrews and other nations, as appears in a striking way from the fact that on this account alone the Romans found themselves compelled to exempt the Jews from all military service. The rules of the Scribes enumerated thirty-nine main kinds of work forbidden on the Sabbath, and each of these prohibitions gave rise to new subtilties. Jesus’s disciples, for example, who plucked ears of corn in passing through a field on the holy day, had, according to Rabbinical views, violated the third of the thirty-nine rules,2 which forbade harvesting; and in healing the sick Jesus Himself broke the rule that a sick man should not receive medical aid on the Sabbath unless his life was in danger. In fact, as our Lord puts it, the Rabbinical theory seemed to be that the Sabbath was not made for man but for the Sabbath, the observance of which was so much an end in itself that the rules prescribed for it did not require to be justified by appeal to any larger principle of religion or humanity. The precepts of the law were valuable in the eyes of the Scribes because they were the seal of Jewish particularism, the barrier erected between the world at large and the exclusive community of Yahweh’s grace. The ideal of the Sabbath which all these rules aimed at realizing was absolute rest from everything that could be called work, and even the exercise of those offices of humanity which the strictest Christian Sabbatarians regard as a service to God, and therefore as specially appropriate to His day, was looked on as work. To save life was allowed, but only because danger to life “superseded the Sabbath.” In like manner the special ritual at the temple prescribed for the Sabbath by the Pentateuchal law was not regarded as any part of the hallowing of the sacred day; on the contrary, the rule was that, in this regard, “Sabbath was not kept in the sanctuary.” Strictly speaking, therefore, the Sabbath was neither a day of rest to toiling humanity nor a day appointed for public worship; the positive duties of its observance were to wear one’s best clothes, eat, drink and be glad (justified from Isa. lvi. 13). A more directly religious element, it is true, was introduced by the practice of attending the synagogue service; but it is to be noted that the grammatical inflexions of the word Sabbath, which would show that this is a feminine form, properly shabbath, is always Sabbath. The root has no positive action, and does work, in the sense of enjoying rest, even in transitive forms and applications it means to “sever,” to “put an end to,” and intransitively it means to “desist,” to “come to an end.” The grammatical form of shabbath suggests a transitive sense, the transitive idea being a restlessness and apparently intransitive Sabbath as dividing the month. It may mean the day which puts a stop to the week’s work, but this is less likely. It certainly cannot be translated “the day of rest.”

1 From the Thirty-ninth was deduced the familiar “Sabbath day’s journey” (Acts i. 12), based primarily, it would seem, upon the command in Ex. xvi. 29. It was a distance of 2000 cubits.

2 From the Thirty-ninth was deduced the familiar “Sabbath day’s journey” (Acts i. 12), based primarily, it would seem, upon the command in Ex. xvi. 29. It was a distance of 2000 cubits.
remembered that this service was primarily regarded not as an act of worship but as a meeting for instruction in the law.

2. **Attitude of Jesus.**—So far, therefore, as the Sabbath existed for any end outside itself it was an institution to help every Jew to learn the law, and from this point of view it is regarded by Philo and Josephus, who are accustomed to seek a philosophical justification for the peculiar institutions of their religion. But this certainly was not the leading point of view with the mass of the Rabbins; and at any rate it is quite certain that the synagogue is a post-exilic institution, and therefore that the Sabbath in old Israel must have been entirely different from the Sabbath of the Scriptures. But that it was destitute of any properly religious observance or meaning is inconceivable, for, though many of the religious ideas of the old Hebrews were crude, their institutions were never arbitrary and meaningless, and when they spoke of consecrating the Sabbath they must have had in view some religious exercise or sacrifice which had a special relationship to Yahweh. Indeed, that the old Hebrew Sabbath was quite different from the Rabbinical Sabbath is demonstrated in the trenchant criticism which Jesus directed against the latter (Matt. xii. 1-14; Mark ii. 27). The general position which He takes up, that "the Sabbath is made for man and not man for the Sabbath," is only a special application of the wider principle that the law is not an end in itself but a help towards the realization in life of the great ideal of love to God and man, which is the sum of all true religion. But Jesus further maintains that this view of the Sabbath as a whole, and the interpretation of the Sabbath law which it involves, can be historically justified from the Old Testament. And in this connexion He introduces two of the main methods to which historic criticism of the Old Testament has recurred in modern times: He appeals to the oldest history rather than to the Pentateuchal code as proving that the later conception of the law was unknown in ancient times (Matt. xii. 3-8, and to the exceptions to the Sabbath law which the Talmud itself allowed in the interests of worship (y. 5) or humanity (v. 11), as showing that the Sabbath must originally have been devoted to purposes of worship and humanity, and was not always the purposeless arbitrary thing which the synagogue made it to be. Modern criticism of the history of Sabbath observance among the Hebrews has done nothing more than follow out these arguments in detail, and show that the result is in agreement with what is known as to the dates of the several component parts of the Pentateuch.

3. **Old Usage.**—Of the legal passages that speak of the Sabbath all those which show affinity with the doctrine of the Scriptures—regarding the Sabbath as an arbitrary sign between Yahweh and Israel; entering into details as to particular acts that are forbidden, and enforcing the observance by severe penalties, so that no man has any religious value, but appears as a mere legal constraint—are post-exilic (Exod. xvi. 23-30, xxxi. 12-17, xxxv. 1-3; Num. xv. 32-36); while the older laws only demand such cessation from daily toil, and especially from agricultural labour, as among all ancient peoples naturally accompanied a day set apart as a religious festival, and in particular lay weight on the fact that the Sabbath is a humane institution, a holiday for the labouring classes (Exod. xxii. 12; Deut. v. 13-15). As it stands in these ancient laws, the Sabbath is not at all the unique thing which it was made to be by the Scribes. "The Greeks and the barbarians," says Strabo (x. 3, 9), "have this in common, that they accompany their sacred rites by a festal remission of labour." So it was old Israel: the Sabbath was one of the stated religious feasts; like the new moon and the three great agricultural festivals (Hoses ii. 11); the new moons and the Sabbath were both regarded as necessary to the sanctuary and to sacrifice (Isa. i. 14); the remission of ordinary business belonged to both alike (Amos viii. 5), and for precisely the same reason. Hosea even takes it for granted that in captivity the Sabbath will be suspended, like all the other feasts, because in his day a feast implied a sanctuary. This conception of the Sabbath, however, necessarily underwent an important modification when the local institutions were abolished under the "Deuteronomistic" reform, and those sacrificial rites and feasts which in Hosea's time formed the essence of every act of religion were limited to the central altar, which most men could visit only at rare intervals. From this time forward the new moons, which till then had been at least as important as the Sabbath and were celebrated by sacrificial feasts as occasions of religious gladness, fell into insignificance, except in the conservative temple ritual. The Sabbath did not share the same fate, but with the abolition of local sacrifices it became for most Israelites an institution of humanity divorced from ritual. So it appears in the Deuteronomistic decalogue, and presentation of the Jer. xvii. 19 seq. In this form the Sabbath was one of the few outward ordinances by which the Israelite could still show his fidelity to Yahweh and mark his separation from the heathen. Hence we understand the importance attached to it in the exilic literature (Isa. xvi. 2 seq., xviii. 13), and the character of a sign between Yahweh and Israel ascribed to it in the post-exilic law. This attachment to the Sabbath, beautiful and touching so long as it was a spontaneous expression of continual devotion to Yahweh, acquired a less pleasing character when, after the exile, it came to be enforced by the civil arm (Neh. xiii.), and when the later law even declared Sabbath-breaking a capital offence. This increasing strictness is exemplified by the attitude of the Book of Jubilees (ii. 17-32, 1. 6-13). But it is just to remember that without the stern discipline of the law the community of the second temple could hardly have escaped dissolution, and that Judaism alone preserved for Christianity the hard-won achievements of the prophets.

4. **Early Christian Church.**—The Sabbath exercised a twofold influence on the early Christian church. On the one hand, the weekly celebration of the resurrection on the Lord's day could not have arisen except in a circle that already knew the week as a sacred division of time; and, moreover, the manner in which the Lord's day was observed was directly influenced by the synagogue service. On the other hand, the Jewish Christians continued to keep the Sabbath, like other points of the old law. Eusebius (H.E. iii. 27) remarks that the Ebionites observed both the Sabbath and the Lord's day; and this practice obtained to some extent in much wider circles, for the Apostolical Constitutions recommend that the Sabbath shall be kept as a memorial feast of the creation as well as the Lord's day as a memorial of the resurrection. The festal character of the Sabbath was long recognized in the Eastern church by a prohibition of fasting on that day, which was also a point in the Jewish Sabbath law (comp. Jud. viii. 6). On the other hand, Paul had quite distinctly laid down from the first days of Gentile Christianity that the Jewish Sabbath was not binding on Christians (Rom. iv. 5 seq.; Gal. iv. 10; Col. ii. 16), and controversy with the Judaizers led in process of time to direct condemnation of those who still kept the Jewish day (e.g. G. C. of Laodicea, A.D. 363). Nay, in the Roman church a practice of fasting on Saturday as well as on Friday was current before the time of Tertullian. The steps by which the practice of resting from labour on the Lord's day instead of on the Sabbath was established in Christendom and received civil as well as ecclesiastical sanction are dealt with under Sunday; it is enough to observe here that this practice is naturally and even necessarily connected with the religious observance of the Lord's day as the day of preparation for the resurrection, and is in full accordance with the principles laid down by Jesus in His criticism of the Sabbath of the Scriptures. But of course the
complete observance of Sunday rest was not generally possible to the early Christians before Christendom obtained civil recognition.1

5. Origin.—As the Sabbath was originally a religious feast, the question of the origin of the Sabbath resolves itself into an inquiry why and in what circle a festal cycle of seven days was first established. In Gen. ii. 1-3 and in Exod. xx. 11 the Sabbath is declared to be a memorial of the completion of the work of creation in six days. But it appears certain that the decalogue as it lay before the Deuteronomist did not contain any allusion to the creation (see Decalogue), and it is generally believed that this reference was added by the same post-exilic hand that wrote Gen. i. 1-2. The earlier account of the creation in Gen. ii. 4b seq. does not receive the heaemonian, and it is even doubtful whether the original sketch of Gen. i. distributed creation over six days. The connection, therefore, between the seven days' week and the work of creation is now generally recognized as secondary.2 But, if the week as a religious cycle is older than the idea of the week of creation, we cannot hope to find much to show us the origin of the Sabbath. Unless the Sabbath was already an institution peculiarly Jewish, it could not have served as a mark of distinction from heathenism. This, however, does not necessarily imply that in its origin it was specifically Hebrew, but only that it had acquired distinguishing features of a marked kind. What is certain is that the origin of the Sabbath must be sought within a circle that used the week as a division of time. Here again we must distinguish between the week as such and the astrological week, i.e., the week in which the seven days are named each after the planet which is held to preside over its first hour.3 It is plain, however, that there is a long step between the astrological ascription of each hour of the week to a planet and the recognition of the week as an ordinary division of time by people at large. Astrology is in nature an occult science, and there is no trace of a day of twenty-four hours among the ancient Hebrews. Moreover, it is doubtful from extant remains of Assyrian calendars whether the astrological week prevailed there in the civil life even among the Babylonians and Assyrians. They did not dedicate each day in turn to its astrological planet; and it is therefore precarious to assume that the Sabbath was in its origin what it is in the astronomical week, the day sacred to Saturn, and that its observance is to be derived from an ancient Hebrew worship of that planet.4

The week, however, is found in various parts of the world in a form that has nothing to do with astrology or the seven planets, and with such a distribution as to make it pretty certain that it had no artificial origin, but suggested itself independently, and for natural reasons, to different races. In fact, the four quarters of the moon supply an obvious division of the month; and, wherever new moon and full moon are religious occasions, we get in the most natural way a sacred cycle of fourteen or fifteen days, of which the week of seven or eight days (determined by half moon) is the half. Thus the old Hindus chose the new and the full moon as days of sacrifice; the eve of the sacrifice was called upavasata, and in Buddhism the same word (ubhāsata) has come to denote a Sabbath observed on the full moon, on the day when there is no moon, and on the two days which are eighth from the full and the new moon respectively, with fasting and other religious exercises.5 From this point of view it is most significant that in the older parts of the Hebrew Scriptures the new moon and the Sabbath are almost invariably mentioned together.6

Nor are other traces wanting of the connexion of sacrificial occasions—i.e., religious feasts—with the phases of the moon among the Semites. This text is found in a number of sacrificial days in every month, and of these two at least were determined by the conjunction and opposition of the moon.7 That full moon as well as new moon had a religious significance among the ancient Hebrews seems to follow upon the idea that when the great agricultural feasts were fixed to set days, the full moon was chosen. In older times these feast-days appear to have been Sabbaths (Lev. xxii. 11; comp. the article Passover). A week determined by the phases of the moon has an average length of 29½ ± 7½ days, i.e., three weeks or about eight and a half days. But these changes are to be seen in 1 Sam. xx. 27, compared with verses 28, 24, an indication that in old times the feast of the new moons lasted two days.8 In that case a week of full moons would be somewhat under seven days. We cannot tell when the Sabbath became dissociated from the moon; but the change seems to have been made before the Book of the Covenant, which already regards the Sabbath simply as an institution of humanity and ignores the new moon. In both cases it is followed by the sabbathonomy (W. R. S. Laqueur, ii. 135, C.).

16. The Babylonian and Assyrian Sabbath.—The Babylonian calendars contain explicit directions for the observance of abstinence from certain secular acts on certain days which forms a close parallel to the Jewish Sabbath rules. Thus for the 7th, 14th, 21st, and the 28th at the intercalary Elul it is prescribed that the shepherd of many nations is not to eat meat roast with fire nor any food cooked by fire, he is not to change the clothes on his body nor put on gala dress, he may not engage in sacrifices nor may the women of his household attend to his altar; all this is to be done in order that he may seek an oracle for him in the sanctuary, no physician may attend the sick room, the day is not favourable for invoking curses, but at night the king may bring his gift into the presence of Marduk and Labinius. When he has seen the sign, he will know what to do. Clearly, then, it was a day of suspended activity, but it will be noted that no religious observances are prescribed in place of the forbidden secular matters. So far no evidence is forthcoming that the same month contained a Sabbath feast-day. The latter part of each month was holy, but the whole month was not, any more than a month contains a Sabbath. Calendars exist for other months which make no such regulations for any days. These abstentions are prescribed for the king and a few other persons; there is no evidence that they were expected of the laity. The sacredness of some days, such as the 1st of Asar-ili (the New Moon), appear to have had its sacred nature as the 49th day from the commencement of the preceding month, assuming that to have had 30 days. The months often had only 29 days, when the same character ought to have been ascribed to the last day of each month. There is consequently no evidence that these days were called sabattu, a word which is rendered by šem šabbāt, 'day of rest of the heart,' and has been thought to be the origin of Sabbath. This name sabattu was certainly applied to the 15th day of the month, and šem šabbāt could mean 'day of rest in the middle,' referring to the moon's pause at the full. The frequent Yd Testament association of 'new moons and Sabbaths' may point to an original observance of the New Moon, but this new moon was not the first day of the month as in the calendar as nubatu, a term which signifies rest, pause, and especially a god's ceremonial rest with his consort goddess. The observance of such days was a bar to attending even on important occasions, and the business of the day was suspended. Many such Sabbats fell on the 3rd, 7th, and 11th of the intercalary month of Elul, and were noted as the nubatu of Marduk and his consort. It would be precarious to assume that the same days in each month were nubatu, for the nubatu fell on the 4th of Lyar on one occasion.

1 See, further, E. Schürer in Zeit. f. Neu-Test. Wissens. (1905), pp. 1-66. For the theological discussions whether and in what sense the fourth commandment is binding on Christians, see Decalogue, p. 291.4

2 The week, ended by the Sabbath, determined the 'days of creation, not the 'days of creation the week' (S. R. Driver, Genesis (1909), p. 35). At the same time, there was a peculiarity about associating the first day with the doctrine of Yahweh is the Creator of all things; for we see from Isa. xl. 5—6, that this doctrine was a mainstay of Jewish faith in those very days of exile which gave the Sabbath a new importance for the future.

3 If the day is divided into twenty-four hours and the planets preside over each hour of the week in the order of their periodic times (Saturn, Jupiter, Mars, Sun, Venus, Mercury, Moon), we get the order of the days of associating the planets with the days of the week, as follows: if the Sun, presides over the first hour of Sunday, and therefore also over the eighth, the fifteenth and the twenty-second, Venus will have the twenty-third hour, Mercury the twenty-fourth, and the Moon, as the third in order from the Sun, will preside over the first of the next week. If we assume that the Sun preside over Tuesday (Dies Martis, Mardi), and so forth. This astrological week became very current in the Roman empire, but was still a novelty in the time of Dio Cassius (xxxvi. 18).

5 Both were days of cessation from business (Ams viii. 5), and were fitting occasions to visit a prophet (2 Kings iv. 23). They naturally take their rise among an agricultural folk. On abstinence from business on the Sabbath, see M. Friedmann, Jev. Quart. Rev. ill. (1911), p. 72. See also L. Benzerger, Encycl. Biblica, cols. 340 sqq.

6 The others—according to the Tifriti, 310, 14—are the 17th and the 28th; see Chwolson, Statuir, ii. 8, 94 seq.

7 It appears from the Tifriti viii. 6 that even in later times there were two days at the new moon on which it was not proper to fast.

Possibly the intercalary month was abnormal, the incidence of observances depending not on the day of the month in ordinary months but on the day of the week reckoned consecutively through the year. For it is obvious that if each 7th day during the year was observed as the sabbath, the 7th day of each month would fall on a different day of the month in different months. It is quite possible that *shabbatum* and *nubatrum* are from the same root and originally denoted much the same thing—a pause, abstention, from work. It is possible that certain Proconsuls observed the intercalary month being purely arbitrary may exhibit a normal arrangement, supposing that the month and the week begin together.

There are traces of what may be called a "five-day week," but also of one of seven days, and also traces of some submultiple of the 30-day month, but the exact relation of seven days to the month is not very clear. If the 15th always was full moon day, the 7th would coincide well with half moon, but the 21st and 29th would fall away considerably from the moon's phases. The exact number of seven throughout Babylonian literature is very marked, and most of the material has been collected by J. Hahn, *Siebenzahl und Sabbat* (1907). It is quite consistent with the evidence to suppose that a seven-day week was in use in Babylonia, but each item may be explained differently, and a definite proof does not exist.

The enormous number of dated documents has induced some scholars to attempt a statistical research into the observance of the 7th, 14th, 21st, 28th and 29th days of the months as Sabbaths. This has not been attempted to any considerable extent, and thus the Sabbaths may be considered as an abstention from all such business as recorded in dated documents and always fell on these days, then the 7th, &c., should show a marked falling off in the number of dated documents. This appears actually to be the case, though the 1st day of the Babylonian new week (the 2nd day of the Jewish week) was not observed in the 7th century in Assyria, where early Babylonian customs were kept up conservatively. In other cases the inclusion of documents relating to the temple business, payments of tithes and other dues, salaries of Babylonian officials and various other matters which may have demanded the presence of the congregation and were at least partly religious in nature, have been allowed to complicate the matter. Such business as did not profit the Sabbath according to the precepts of the Law is indeed observed, but the observance of our Sabbath in the Levitical sense passed off.

Further, if the Sabbaths fell on each 7th day through the year, any indication by dated documents of a falling off in the number of transactions on the 7th day of the month might be due to some other reason. If the records appealed to are from temple archives, it may be expected that the Sabbath days would show an increased number of records. For reasons above indicated the whole subject is in its infancy. Even if it could be shown that the Pentateuchal regulations were universally observed in Israel from Mosaic times, it would not preclude a certain indebtedness to Babylonia for at least the germs of the institution. On the other hand, complete indentity of regulations and observance in Babylonia and Israel at one period need not show more than development on the same lines. The evidence of Babylonian observance has not yet been exhaustively considered. Its most suggestive likenesses are indicated above, but further evidence may render the similarity less striking when the meaning of it is more fully understood.

(C. H. W. J.)

7. Sabbatical Year.—The Jews under the second temple observed every seventh year as a Sabbath according to the (post-exilic) law of Lev. xxv. 1-7. It was a year in which all agriculture was remitted, in which the fields lay unsown and the vines grew unpruned, only the spontaneous yield of the land might be gathered. That this law was not observed before the captivity we learn from Lev. xxvi. 34 seq. (cp. 2 Chron. xxxvii. 21); indeed, so long as the Hebrews were an agricultural people, the Sabbatical year by no means fell in the 7th year, and the Sabbatical year could not have been observed. Even in later times it was occasionally productive of great distress (1 Mac. vi. 49, 53; Jos. Ant. xiv. 16, 2). In the older legislation, however, we already meet with a seven years' period in more than one connexion. The release of a Hebrew servant after six years' labour (Exod. xxi. 2 seq.; Deut. xv. 12 seq.) has only a remote analogy to the Sabbatical year. But in Exod. xxxii. 10 seq. it is prescribed that the crop of every seventh year shall be left for the poor, and after them for the beasts. The difference between this and the latter law is that the seventh year is not called a Sabbath, and that there is no indication that all land was to lie fallow on the same year. In this form a law prescribing one year's fallow in seven may have been anciently observed, but it scarcely originated from the analogy of a seventh day of rest. It is extended in v. 11 to the vineyard and the olive oil, but here the culture necessary to keep the vines and olive trees in order is not forbidden; the precept is only that the produce is to be left to the poor. In Deuteronomy this law is not repeated, but a fixed seven years' period is ordained for the benefit of poor debtors, apparently in the sense that in the seventh year no interest is to be exacted by the creditor from a Hebrew, or that no proceedings are to be taken against the debtor during that year (Deut. xv. 1 seq.). See the discussion by Driver, *Internat. Crit. Comm., ad loc.*, and the commentaries on Neh. v. 11.

**Literature.**—In addition to the references already made, see the articles in Ency. Bib. and Hastings' Dict. Bible (with references); Fr. Bohn, *Sabbat im Alten Testament u. altjudisch. relig. Aberglauben* (Gütersloh, 1905: an interesting list of unlucky days from an old Egyptian calendar on p. 57 seq.); and for post-Biblical literature, F. WEBER'S *Judische Theologie* (Index), by Franz DELITZSCH and Schnedermann (1897).

**SABBATON, or SAMBATON, a river (real or imaginary) in Media—named in some old authorities (Palestinian Talmud, and Midrash Gen. Rabba, lxxxii.)—the site of the exile of the Ten Tribes. But Josephus (War, vii. 1) has this curious passage, from which, no doubt, many of the subsequent legends were derived:—**

Now Titus Caesar tarried some time at Berytus (Beirut) and then removed thence and gave magnificent shows in all the cities of Syria through which he went, and exhibited the captive and a proof of the destruction of that nation. He saw on his march a river named Sabato, or Sambatyon, and since (from the intermittent spring Faward ed-Deir in the Lebanon) of such a nature as deserves to be recorded in history. It runs between Araca (Arka), which is part of Agrippa's kingdom, and Raphara, near the city of Berytus. It is said to be the seventh river of Egypt, and has something very wonderful and peculiar in it. For when it flows it is strong, and has plenty of water; after which its springs fail for six days together, and leave its channel dry, as any one may see. After this it runs on the seventh day, springs up and increases, and as though it had undergone no change at all, and it has been observed that in this order perpetually and exactly: whence they call it the Sabbatic river, so naming it from the sacred Sabbath of the Jews.'

Whiston, in his notes to Josephus, already points out that Pliny describes the same river (Hist. Nat. xxxi. 11), but according to his account the river ran for six days and rested on the seventh, so that it was the seventh river of Egypt. This is the favourite form of the legend, for though there are intermittent streams in various parts of Asia, none has yet been found to correspond to the fixed regularity posited in the tradition. Various medieval travellers reported such rivers, e.g. Petahiah of Regensburg, who states that such a stream may be found near Jahneb, but his assertion is unfounded. Mahomedans still assert that Josephus's statement is true of the *Nahr-al-Arus* in the neighbourhood in which he locates his Sabbatic river, but modern travellers report that this stream runs every third day. Such facts would, however, be sufficient to explain the origin of the legend. The accounts of Josephus and Pliny do not assert that the intermittence of the current had any connexion with Saturday. Aquiba (q.v.) in the early part of the 2nd century A.D., however, assumes this connexion (Sanhedrin 65 b), and a confusion between the Sambaton of the Lost Tribes and the Sabbatical river of Syria begins to manifest itself. It is owing to the narrative of Eldad the Danite (q.v.) that the Sambaton river rose into wide fame in the 4th century. His diary became the Arabic *Nights* not only of the Jews but also of many medieval Christians. Eldad describes *The Children of Moses*, a powerful and Utopian race, whose territory is surrounded by a wonderful river. He describes it in these terms:—

"The river Sambaton is 200 yds. broad, about as far as a bow-shot. It is full of sand and stones, but without water; the stones gave great noise like the waves of the sea and a stormy wind, so that in the night the noise is heard at a distance of half a day's journey. There are sources of water which collect themselves in one pool, out of which they water the fields. There are fish in it, and all kinds of nice birds fly round it. And this river of stone and sand runs during the six days, but at the seventh, the Sabbath day. As soon as the Sabbath begins, fire surrounds the river, and the flames remain until the next evening, when the Sabbath ends."

Nöldeke (*Beiträge zur Geschichte des Alexanderromans*, 48) has shown that the Sambaton appears in one version of the Alexander Legend. Kaswini, the author of the Arab *Cosmography*, also refers to the Sambaton. So does Prester John in his letter addressed to the emperor Frederick; in his account it is the violence of the current of sand and stone that prevents the Lost Tribes from reuniting. It is unnecessary to summarize
the various embellishments of the legend; in one version the river contains a width of 17 m. and throws stones as high as a house. But there are no stones on Saturday; it then resembles a lake of snow-white sand. Menasseh ben Israel (q.v.), who gave vogue to this latter story in his Hope of Israel, adds the detail that if sand from Sambatyon be kept in a bottle it agitates itself during six days but remains still on the Saturday.

The site of the Sambatyon varies considerably in the different narratives. Media, Ethiopia, Persia, India, the Caspian district, —all these are suggested. Reggio identified the river with the Euphrates, Fünn with the Zeb in Adiabene. But as Neubauer remarks: "It would be lost time to trouble ourselves about the identification of this stream."

See Neubauer, "Where are the Ten Tribes?" in Jewish Quarterly Review, vol. 1, passim; M. Seligsohn in Jewish Encyclopedia, x. 681. (I. A.)

SABBIONETA, a town of Lombardy, Italy, in the province of Mantua, from which it is 20 m. S.W. by steam tramway, not far from the N. bank of the Po, 59 ft. above sea-level. Pop. (1901) 1835 (town); 7016 (commune). Its period of prosperity was under Vespasiano Gonzaga (d. 1597), who was its duke; by him it was transformed into a small "Residenzstadt." It was well fortified and built, and from this period date the ducal palace (now the Municipio), the theatre designed by Scamozzi, &c. The church and the summer palace contain frescoes by the Campi of Cremona. Here in 1697 a Hebrew printing-press was set up.

SABELLIUS, the name originally given by Mommsen in his Unterrichtliche Diakolie to the pre-Roman dialects of Central Italy which was neither Oscan nor Umbrian. The progress of study has, however, grouped them under more specific names, such as the "North Oscan" group (see Paeligni) and the "Latinian" group (see Latin Language), and the only content now left for the term Sabellic consists of a group of 8 or 9 inscriptions to which it certainly cannot be applied with truth. They are probably, if not certainly, the most ancient inscriptions in existence on Italian soil. Since they were all found on a strip of the eastern coast running from the mouth of the Arturnus on the south to Pesaro on the north, it is probably best to call them simply "East Italic" or "Adriatic."

Not even the transcription of their alphabet has reached the stage of certainty, for even in this small number of inscriptions the alphabet seems to vary. The chief doubt is about the value of W and V (or A and a) which appear beside the symbol on the same inscriptions; and of the dots in the middle of the line which are certainly not interpoints. They may conceivably have some connexion with the dots in Venetic inscriptions, which R. S. Conway has endeavoured to explain (see Veneti). The most striking characteristic of the group of inscriptions is that the direction of the writing in alternate lines is not merely reversed but inverted ("serpentous boutrophedon" as on the Etruscan stele of Capua of the 5th century B.C.) (see Etrurian: Language). Thus if the first line consisted of the letters ABC, in that order, the next would be DEF, i.e. with each letter turned so as to face the left, and with its head downwards. This arrangement appears in some of the Venetic inscriptions also. The longest of the inscriptions is that from Grecchio, now preserved in the Naples Museum. The probability is that this and all the rest were epigraphs, but a translation is as yet out of the question. The stone from Castrignano gives us certain forms which seem to be recognisable as Indo-European, namely patera, matera, though it is far from certain that the symbol δ, which is here represented by f, really has that value.

Pauli's conjecture that these inscriptions probably represent the language of some settlers from Illyria has little support except that of some coincidences in tribal and local names on the two sides of the Adriatic (e.g. "Truentum, quod solum Liburnorum in Italia relicum est" (Plin. Nat. Hist. iii. 110), -centum being a frequent Illyrian ending, and Liburni an Illyrian tribe), though it is a priori likely enough.

For the authorities for the alphabets and the text of the inscriptions as known down to 1897, see R. S. Conway's Italic Dialects (Cambridge, 1897), ii. 528; and nothing has yet (1906) been added to what was written about the alphabets by Karl Pauli (Althit. Stud. iii., "Die Veneter," Leipzig, 1891, pp. 220 seq. and p. 423). Some plausible (but wholly uncertain) conjectures as to the meaning of some of the inscriptions may be sought in the appendix to Zvetaliev's Inscr. Italie inferioris dialecticae; and since 1897 a further inscription of this class has been found at Belmonte Piceno, which is preserved in the museum at Bologna and reported by Bizio in Notiz. degli scavi, 1903, p. 104.

It is to be noticed that a much longer and far more legible inscription from Novilara (now in the museum at Pesaro) a little below S. Giovanni at Bolsena, has sometimes been spoken of as Sabellic: yet the first two words are minnis erit, is perhaps more probably to be regarded as containing some variety of Etruscan, though its character is far from certain. Its alphabet closely resembles Etruscan of the 4th century B.C. It is a very interesting monument both for its own sake, since it is sculptured as well as inscribed (there is one—or more—hunting or pastoral scene on the back), and because the archaeological stratum (late Bronze period) of the cemetery from which it is believed to have come is clearly marked.

With a companion fragment it is fully described by Bizio in Mem. Accad. Lincei, v. (1897), and has also been discussed by Ella Lattes in Hermes (xxii. 465 and xxiii. 32).

SABELLIUS (fl. 230), early Christian presbyter and theologian, was of Libyan origin, and came from the Pentapolis to Rome early in the 3rd century. To understand his position a brief review of the Christian thought of the time is necessary. Even after the elimination of Gnosticism the church remained without any uniform Christology; the Trinitarians and the Unitarians continued to confront each other, the latter at the beginning of the 3rd century still forming the large majority. These in turn split into two principal groups—the Adoptionists and the Modalists—the former holding Christ to be the man chosen of God, on whom the Holy Spirit rested in a quite unique sense, and who after their life was, through His oneness of will with God, became divine, the latter maintaining Christ to be a manifestation of God Himself. Both groups had their scientific theologians who sought to vindicate their characteristic doctrines, the Adoptionist divines holding by the Aristotelian philosophy, and the Modalists by that of the Stoics; while the Trinitarians (Tertullian, Hippolytus, Origen, Novatian), on the other hand, appealed to Plato.

In Rome Modalism was the doctrine which prevailed from Victor to Calixtus or Callistus (c. 190-220). The bishops just named protected within the city the schools of Epigenus and Cleomenes, where it was taught that the Son is identical with the Father. But the presbyter Hippolytus was successful in convincing the leaders that church that the Modalistic doctrine taken in its strictness was contrary to Scripture. Calixtus saw himself under the necessity of abandoning his friends and setting up a mediating formula designed to harmonize the Trinitarian and the Modalistic positions. But, while communicating the strict Unitarians (Monarchs), he also took the same course with Hippolytus and his followers, declaring their teaching to be dithesism. The mediation formula, however, proposed by Calixtus became the bridge by which, in the course of the decades immediately following, the doctrine of the Trinity found its way into the Roman Church. In the year 251, when the Roman presbyter Novatian wrote his book De Trinitate, the doctrine of Hippolytus, once discredited as dithesism, had already become official there. At the same time Rome and most of the other churches of the West still retained a certain leaning towards Modalistic monarchism. This appears, on the one hand, in the use of expressions having a Modalistic ring about them—see especially the poems of Commodian, written about the time of Valerian—and, on the other hand, in the rejection of the doctrine that the Son is subordinate to the Father and is a creature (witness the controversy between Dionysius of Alexandria and Dionysius of Rome), as well as in the readiness of the West to accept the formula of Athanasius, that the Father and the Son are one and the same in substance (μισθανος).

The strict Modalists, whom Calixtus had excommunicated along with their most zealous opponent Hippolytus, were 14-
by Sabellius. His party continued to subsist in Rome for a considerable time afterwards, and withstood Calixtus as an unscrupulous apostate. In the West, however, the influence of Sabellius seems never to have been important; in the East, on the other hand, after the middle of the 3rd century his doctrine found much acceptance, first in the Pentapolis and afterwards in others of the Churches. It was controvcrved by the bishops, notably by Dionysius of Alexandria, and the development in the East of the philosophical doctrine of the Trinity after Origen (from 250 to 320) was very powerfully influenced by the opposition to Sabellianism. Thus, for example, at the great synod held in Antioch in 268 the word ημωσιας was rejected, as seeming to favour Unitarianism. The Sabellian doctrine itself, however, during the decades above mentioned underwent many changes in the East and received a philosophical dress. In the 4th century this and the allied doctrine of Marcellus of Ancyra were frequently confounded, so that it is exceedingly difficult to arrive at a clear account of it in its genuine form. Sabellianism, in fact, became a collective name for all those Unitarian doctrines in which the divine nature of Christ was acknowledged. The teaching of Sabellius himself was very closely allied to the older Modalism ("Patripassianism") of Noetus and Praxeas, but was distinguished from it by its more careful theological elaboration and by the character of the Holy Spirit. His central proposition was to the effect that Father, Son and Holy Spirit are the same person, three names thus being attached to one and the same being. What weighed most with Sabellius was the monotheistic interest. The One Being was also named by him νοστάτον—an expression purposely chosen to obviate ambiguity. To explain how one and the same being could have various forms of manifestation, he pointed to the tripartite nature of man (body, soul, spirit), and to the sun, which manifests itself as a heavenly body, as a source of light and also as a source of warmth. He further maintained that God is not at one and the same time Father, Son and Spirit, but, on the contrary, has been active in three apparently consecutive manifestations or energies—first in the προσωπον of the Father as Creator and Lawgiver, then in the προσωπον of the Son as Redeemer, and lastly in the προσωπον of the Spirit as the Giver of Life. It is by this doctrine of the three persons of the Godhead that Sabellianism is distinguished from the modalists. In particular it is significant in conjunction with the reference to the Holy Spirit, that Sabellius regards the Father also as merely a form of manifestation of the one God—in other words, has formally put Him in a position of complete equality with the other Persons. This view prepares the way for Augustine's doctrine of the Trinity. Sabellius himself appears to have made use of Stoical formulas (παλινείσθαι, σοστικήσθαι), but he chiefly relied upon Scripture, especially such passages as Deut. vi. 4; Exod. xx. 3; Isa. xlv. 6; John x. 38. Of his later history nothing is known; his followers died out in the course of the 4th century.

The sources of our knowledge of Sabellianism are Hippolytus (Philos. bk. iv.), Epiphanius (Hær. bii.) and Dionysius Alex. (Ep.); also various passages in Athanasius and the other fathers of the 4th century. For modern discussions of the subject see Schleiermacher (Theol. Ztschr. 1822, Hft. 3); Lange (Ztschr. f. hist. Theol. 1832, ii. 2); Döllinger (Hippolyt u. Kilidias, 1853). Zahn (Marcell u. Ancyra, 1867); R. L. Ottley, The Doctrine of the Incarnation (1896); various histories of Dogma, and Harnack (i.e. "Monarchianismus," in Herzog-Hauck, Realencyk., s. v. prod. Theol. und Kirch., ii. 303). (A. H.A.)

**Sabians—Sabin**

The Sabians (as-Sabi'un) who are first mentioned in the Koran (ii. 59, v. 73, xx. 17) were a semi-Christian sect of Babylonia, the Medineans, closely resembling the Mandaeans or so-called "Christians of St John the Baptist," but not identified with them. Their name is probably derived from the Aramaic סַבִּי, a dialectical form of סב, and signifies "those who wash themselves"; the term al-mughalsia, which is sometimes applied to them by Arab writers, has the same meaning, and they were also known as ḥumudastarai. How Mahomet understood the term "Sabians" is uncertain, but he mentions them together with the Jews and Christians. The older Mahomedan theologians agreed that they possessed a written revelation and were entitled accordingly to enjoy a toleration not granted to mere heretics. Curiously enough, the name "Sabian" was used by the Meccanidolaters to denote Mahomet himself and his Moslem converts, apparently on account of the frequent ceremonial ablutions which formed a striking feature of the new religion.

From these true Sabians the pseudo-Sabians of Harrân (Carrhae) in Mesopotamia must be carefully distinguished. In A.D. 380 the Caliph Ma'mün, while marching against the Byzantines, received a deputation of the inhabitants of Harrân. Astonished by the sight of their long hair and extraordinary costume, he inquired what religion they professed, and getting no satisfactory answer threatened to exterminate them, unless by the time of his return from the war they should have embraced either Islam or one of the creeds tolerated in the Koran. Consequently, acting on the advice of a Mahomedan jurist, the Harrânians declared themselves to be "Sabians," a name which shielded them from persecution in virtue of its Koranic authority and was so vague that it enabled them to maintain their ancient beliefs undisturbed. There is no doubt as to the general nature of the religious beliefs and practices which they sought to mask. Since the epoch of Alexander the Great Harrân had been a famous centre of pagan and Hellenistic culture; its people were Syrian heathens, star-worshippers versed in astrology and magic. In their temples the planetary powers were propitiated by blood-offerings, and it is probable that human victims were occasionally sacrificed even as late as the 4th century of our era. The more enlightened Harrânians, however, adopted a religious philosophy strongly tinged with Neoplatonic and Christian elements. They produced a brilliant succession of eminent scholars and scientists who transmitted to the Moslems the results of Babylonian civilization and Greek learning, and their influence at the court of Baghdad secured more or less toleration for Sabianism, although in the reign of Harūn al-Rashid the Harrânians had already found it necessary to establish a fund by means of which the conscientious scruples of Moslem officials might be overcome. Accounts of these false Sabians reached the West through Mahommedides, and then through Arabic sources, long before there was any need to mention the name in that connection. It was therefore not only not a disguise. Hence the utmost confusion prevailed in all European accounts of them till Chwolson published in 1856 his Sabian und der Sabismus, in which the authorities for the history and belief of the Harrânians in the middle ages are collected and discussed.

See also "Nouveaux documents pour l'étude de la religion des Harrânians," by Dozy and De Goeje, in the Actes of the sixth Oriental congress, i. 261 f. (Leiden, 1885).

**Sabicu Wood** is the produce of a large leguminous tree, *Lysiloma Sabica*, a native of Cuba. The wood has a rich mahogany colour; it is exceedingly heavy, hard and durable, and therefore most valuable for shipbuilding. Sabicu, on account of its durability, was selected for the stairs of the Great Exhibition (London) of 1851, and, notwithstanding the enormous traffic which passed over them, the wood at the end was found to be little affected by wear.

**Sabine, Sir Edward** (1788–1883), English astronomer and geodesist, was born in Dublin on the 14th of October 1788, a scion of a family said to be of Italian origin. He was educated at the Royal Military Academy, Woolwich, and obtained a commission in the royal artillery at the age of fifteen, attaining the rank of major-general in 1850. His only experience of warfare seems to have been at the siege of Fort Erie (Canada) in 1814. In early life he devoted himself to astronomy and physical geography, and in consequence he was appointed astronomer to various expeditions, among others that of Sir J. Ross (1818) in search of the North-West Passage, and that of Sir E. Parry soon afterwards. Later, he spent long periods on the inter-tropical coasts of Africa and America, and again among the snows of Spitsbergen. He was associated with Henry Williams Chisholm and others as a member of the Royal Commission of
1868-1869 for standardizing weights and measures. Sabine was for ten years (1861-1871) president of the Royal Society, and was made K.C.B. in 1869. He died at East Sheen, Surrey, on the 26th of May 1883.

Of Sabine's scientific work two branches in particular deserve very high credit—his determination of the length of the second's pendulum, and his extensive researches connected with terrestrial magnetism. The establishment of a system of magnetic observatories in various parts of British territory all over the globe was accomplished mainly on his representations; and a great part of his life was devoted to their direction, and to the reduction and discussion of the observations. While the majority of his researches bear on one or other of the subjects just mentioned, others deal with such widely different topics as the birds of Greenland, ocean temperatures, the Gulf Stream, barometric measurement of heights, areas of meridian, glacier transport of rocks, the volcanoes of the Hawaiian Islands, and various points of meteorology.

SABINI, an ancient tribe of Italy, which was more closely in touch with the Romans from the earliest recorded period than any other Italic people. They dwelt in the mountainous country east of the Tiber, and north of the districts inhabited by the Latins and the Aequians in the heart of the Central Apennines. Their later home, between the southern portion of the Umbrians on the north-west, and of the Picenians on the north-east, was probably not very closely determined. The traditions connect them with the beginning of Rome, and with a large number of its early institutions, such as the worship of Jupiter, Mars and Quirinus, and the patrician form of marriage (coniugatio). If their language as distinct from that of the Latins no articular memoral has survived, but we have a large number of single words attributed to them by Latin writers, among which such forms as (1) fucus, Lat. hircus; (2) aussum, Lat. aurum; (3) nouenses, Lat. nouenses ("gods of the nine seats"); (4) the river name Parfurus, beside pure Lat. Fabaris (Servius, ad Aen. vii. 715); and (5) the traditional name of the Sabine king, Numa Pomphilius (contrasted with Lat. Quinctilius), indicate clearly certain peculiarities in Sabine phonology: namely, (1) the representation of the Indo-European palatal aspirate gh by f instead of Lat. k; (2) the retention of s between vowels; (3) the change of medial and initial d to t; (4) the retention of medial f which became in Latin b or d; and (5) the change of Ind.-Eur. q to g. The Sabines were closely connected with the well-attested tradition (e.g., Paul ex Festi, 327 M.) that the Sabines were the parent stock of the Samnites, and this is directly confirmed by the name which the Samnites apparently used for themselves, which, with a Latinized ending, would be Safini (see SANNITES and the other articles there cited, dealing with the minor Samnite tribes).

It is one of the most important problems in ancient history to determine what was the ethnological relation of these tribes, whom we may call "Safini," to the people of Rome on the one hand, and the earlier strata or strata of population in Italy on the other. Much light has been thrown on this group of questions in recent years both from linguistic and from archaeological sources. For the historical and archaeological evidence which connects the Sabines with the patricians of Rome, see Rome, Ancient History. The linguistic side of the matter may be conveniently dealt with here. From this point of view the question to be asked is what language did the Safines speak? Was it most nearly akin to Latin or to Oscan or again to Umbrian and Volscian?

A single monument of 5th- or 4th-century Safine would be of unique value; but in the absence of any such direct evidence we are thrown back on a few cardinal facts: (1) Festus, though he continually cites the Lingua Osca never spoke of Lingua Sabina, but simply of Sabini, and the same is practically true of Varro, who never refers to the language of the Sabines as a living speech, though he does imply (v. 66 and 74) that the dialect used in the district differed somewhat from urban Latin. The speech therefore of the Sabines by Varro's time had become too Latinized to give us more than scanty indications of what it had once been.

The language of the Samnites was that which we now call Oscan (see Osa LINGUA). (3) The evidence of the glosses and place-names already referred to confirms tradition by the resemblance which they show to the phonological characteristics of Oscan. On the other hand there are two or three forms called Sabine by Latin writers which do appear to show the sound q unchanged, especially the name of the Sabine god Quirinus, which seems to be at least indirectly connected with the name of the Sabine town Cures. We do not, however, know that the initial sound of this word was originally a Velar q, and Professor Ridge way ("Who were the Romans," London, 1908, in Proceedings of the British Academy, iii. 19) rightly lays some stress on the fact that the name in Greek form is simply kypuros (not kypous; whereas Lat. Quirines is regularly transcribed kypores), and suggests that the initial sound may have been slightly modified so as to correspond with the pure Latin word quirites (spear-men). In one or two other examples of an apparent q in Safine names or glosses it is not difficult to show that the sound was originally a pure palatal followed by a suffix, a.g. lexua, "desert places," probably for ters-e-ua, cf. pas-e-ua, and Greek gora-leve, Lat. terra, "dry land," from ters(e), so that they would in fact offer no difficulty.

There is therefore more an important piece of evidence which connects all the Safine tribes and distinguishes them sharply, at least in the 5th and following centuries a.C., from the earlier strata of population in Italy. As this point arises in connexion with many tribes it is desirable to offer the evidence for it here once for all. It rests upon the different character of the suffixes used by particular tribes and communities to form their ethnic name.

There are only six suffixes so used among the names of ancient Italy.

1. The suffix -io- appears only in a few old names, *Sidus*, *Titus*, *Subus*, *Poediculi* and *Vituli*, which would have been the pure Latin form instead of Italic, which was taken over from the Grecized form *Idios*.

2. Excluding this small group, the frequency of the occurrence of these suffixes in ancient Italy is shown by the following table:

</table>

The figures in brackets refer to the forms in -CINO-; see below.

3. The names in -io- seem to have been evenly distributed over the Italian area and not to mark any particular tribe or epoch.

4. The suffix -ensi-can be shown to have borne a political significance,

This statement with those which follow is based upon the collections of the place-names of ancient Italy, arranged according to their locality, by R. S. Conway in The Italic Dialects (Cambridge, 1897).
that is to say, it was used by the Romans to form the names of the inhabitants of municipal towns, as for instance *Ft leftist*, the inhabitants of *Forum Julii*. There remain, therefore, the three suffixes *, -o-*, and *, -i-*, and it will be seen from the table that the relative frequency of these suffixes in different dialect-areas varies very greatly. The suffix *, -o-* for, example, has almost driven out any other in the district of the Hirpinii, and it is greatly preponderant among the Campanii, in the district of the Lucani, and among the Latins and Sabines in Latium.

5. On the other hand, the *, -o-* suffix, which is nowhere frequent, is practically confined to the central areas.

6. The *, -i-* suffix is comparatively frequent in the Volscian district and in the territory of the Umbrians; it is also fairly well represented in Latium and Etruria.

7. In the article *Volsci* it is shown that the addition of the *, -o-* suffix is often a mark of the conquest of an original *, -o-* folk by a Sabine or Latin tribe. The tribe thus formed with the *, -i-* suffix: *Ardea* gave first *Ardeitas* and then *Ardeata*; the *Picanies* became *Picanini*, the *Camotes Cameretti*; of such forms there are no fewer than 54.

8. The addition of the *, -o-* suffix to the *, -o-* ethnic, as in *Igapinates*, is comparatively rare, and no doubt denotes the opposite process, namely, the absorption of a, *, -o-* tribe by a population to whom it was natural to use the suffix *, -i-*.

The conclusion, therefore, to which the evidence appears to lead us is that in, say, the 7th century, N.C., the Sabinians spoke a language not differing in any important particulars from that of the Samnites, generally known as *Oscan*; and that when this warlike tribe combined with the people of the Latian plain to found or fortify or enlarge the city of Rome, and at the end of the 6th century to drive out from it the Etruscans, who had in that century become its masters, they imposed upon the new community many of their own usages, especially within the sphere of politics, but in the end adopted the language of Latium henceforth known as *lingua Latina*, just as the Normans adopted the language of the conquered English.

The glosses and place-names of the ancient Sabine district are collected by R. S. Conway, the *Italic Dialects* (Cambridge, 1897), p. 351. For the history of the Sabine district see Mommsen, *C.I.L.* ix. p. 396; and Beloch, *"Der italische Bund unter römischer Hegemonie"* (Leipzig, 1880) and *"La Conquista Romana della regione Sabina,"* in *la Rivista di storia antica* (1905), ix. p. 269.

SABINIANUS, pope from 604 to 606, successor of St Gregory the Great. He incurred unpopularity by his unseasonable economies. The erudite Italian Augustinian Onofrio Panvinio (1529–1568) in his *Epitome pontificum Romanorum* (Venice, 1557) attributes to this pope the introduction of the custom of ringing bells at the canonical hours and for the celebration of the eucharist.

SABLE, the name of a small quadruped, closely akin to the martens, and known by the zoological name of *Mustela silexina*. It is a native of Siberia and famous for its fur. The name appears to be Slavonic in origin, cf. Russian *sobol*, whence it has been adapted into various languages, cf. Ger. *Zobel*, Dutch *Sabel*, the Mod. Fr. *sibeline* and Med. Lat. *sabellum* derive from the Ital. form. The Eng. and Med. Lat. *sabellum* are from the O. Fr. *sable* or *sable* (see Marten and Fur). *"Sable"* in English is a rhetorical or poetical synonym for "black." This comes from the usage in heraldry (first in French) for the colour equivalent to black, represented conventionally by a cross-hatching of vertical and horizontal lines. It has usually been assumed that this is an extension of the name of the fur, but sable fur is brown.

SABLE, MADELEINE DE SOUVRE, MARQUISE DE (1590–1658) French writer, was born in 1599, the daughter of Gilles de Souvre, marquis de Courtenvax, tutor of Louis XIII., and marshal of France. In 1614 she married Philippe Emmanuel de Laval, marquis de Sable, who died in 1640, leaving her in somewhat straitened circumstances. With her friend the comtesse de St Maur she took rooms in the Place Royale, Paris, and established a literary salon. Here originated that class of literature of which the *Maximes* of La Rochefooucauld are the best-known example. The *Maximes* of the marquise de Sable were in fact composed before those of La Rochefooucauld, though not published till after her death. In 1655 she retired, with the comtesse de St Maur, to the Convent of Port Royal des Champs, near Marly, removing in 1661, when that establishment was closed, to Autueil. In 1669 she took up her residence in the Port Royal convent in Paris, where she died on the 16th of January 1678.

SABLE, a town of western France, in the department of Sarthe, on the river Sarthe, 30 m. W.S.W. of Le Mans by rail. Pop. (1906) 49,52. Sable has a château of the 18th century, a fortified gateway, relic of a medieval stronghold, and a modern church with fine stained glass of the early 15th century. Its importance, however, is chiefly due to the manufacture of seals, and the products of which are worked in the town, where flour-milling, the manufacture of farm-implements and trade in cattle are also carried on. A communal college is among the public institutions. From the 11th century Sable was the seat of a powerful barony, which in 1602 was made a duke-peerage in favour of Urbain de Laval, marshal of France. The place afterwards came into the possession of Colbert de Torcy, nephew of the great Colbert who built the château. In 1488 it was agreed to the union of France and Brittany was concluded at Sable, between Charles VIII., and Duke Francis II.

SABLE ANTELOPE, the English name for a large and handsome South African antelope (*Hippotragus niger*), exhibiting the rare feature of blackness or dark colour in both sexes. The sable and the roan antelope (*H. equinus*) belong to a genus nearly related to the oryxes, with which they form a group or subfamily. In all these antelopes long cylindrical horns are present in both sexes; the muzzle is hairy; there is no gland below the eye; the tail is long and tufted; and in the breadth of their tail crowns the upper molar-teeth resemble those of the oxen. The sable and roan antelopes are distinguished from *Oryx* by the stout and thickly ringed horns rising vertically from a ridge over the eyes at an obtuse angle to the plane of the lower part of the face, and then sweeping backwards in a bold curve. Sable antelope are among the handsomest of South African antelopes, and are endowed with great speed and staying power. They are commonly met with in herds including from ten to twenty individuals, but on rare occasions as many as fifty have been seen together. Forest-clad highlands are their favourite resorts. The roan antelope is a larger animal, with shorter horns, whose form is more prominent in both sexes is strawberry-roan. It is typically a South African species, but is represented by a local race in the eastern Sudan (*H. equinus bakeri*) distinguished by its redder colour and different face-makings.

SABINE ISLAND, an island of Nova Scotia, Canada, 110 m. S.E. of Cape Canso, in 43° 56' N. and 60° W. It is composed of shifting sand, and is about 20 m. in length by 1 m. in breadth, rising in places to a height of 85 ft. In the interior is a lake about 10 m. in length. At either end dangerous sandbars run out
about 17 m. into the ocean. It has long been known as “the graveyard of the Atlantic”; over 200 known wrecks have been catalogued, and those unrecorded are believed greatly to exceed this number. The coast is without a harbour and liable to fogs and storms; irregular ocean currents of great strength sweep round it, and its colour makes it indistinguishable until close at hand. Since 1873 an efficient lighthouse system and life-saving station has been maintained by the Canadian government, and the danger has been much lessened. Since 1904 it has been connected with the mainland by wireless telegraphy. The island is constantly changing in shape, owing to the action on the sand of wind and wave, and tends to diminish in size. Since 1793, when taken over by Britain, it has shrunk from 40 m. in length to 20, from 2½ in breadth to 1, and from 200 ft. in height to 65; since 1873 the western lighthouse has thrice been removed eastward. As this makes navigation still more dangerous, the Canadian government has planted thousands of trees and quantities of root-binding grass, and the work of destruction has been somewhat stayed. Wild fruits grow plentifully during the summer, and cranberries are exported. Wild ducks, gulls, and other birds nest in large numbers, and a native breed of ponies has long continued.

Sable Island, estimated as being then over 100 m. in length, was known to the early navigators under the name of Santa Cruz. Early in the 16th century horses were left on its shores by the Portuguese, and the native ponies, supposed to be their descendants, are still exported. In 1508 a band of convicts were left by the marquis de la Roche, but in 1603 the survivors were restored to France.

See Rev. Geo Patterson in Transactions of Royal Society of Canada (1894 and 1897).

**SABRE-FENCING**, the art of attack and defence with the sabre, or broad-sword. Besides the heavy German basket-sabre and the Schlager (see below) there are two varieties of sabre used for fencing, the military sword and the so-called light sabre. These are nearly identical in shape, being composed of a slightly curved blade about 34 in. in length and a handle furnished with a guard to protect the hand; but the military sword, or broad-sword proper, the blade of which is about 1 in. wide near the guard, tapering to ¾ in. near the point, is considerably heavier than the light sabre and is generally preferred by military instructors, being almost identical with the regulation army sabre in size and weight. Until 1900 it was the common fencing sabre in Great Britain, the United States, and most European countries, although its use was practically confined to military circles. About 1900 the light Italian sabre was introduced and became the recognized cut-and-thrust weapon among fencers throughout the world. In Austria-Hungary it became popular as early as 1885, while in Italy, the country of its origin, it has been in use since the middle of the 19th century. Its blade is about 1½ in. wide a little below the guard, tapering to ½ in. just under the point. For practice this is truncated and the edge blunt, but in scoring both edge and point are assumed to be sharp, while in countries on the continent of Europe (though not in Great Britain or the United States) the back-edge (false-edge) is also supposed to be sharpened for some 8 in. from the point. In Italy when used for duelling the point and both edges are actually sharpened.

The modern sabre is a descendant of the curved light cavalry sword of the late 18th century, which was introduced into Europe from the Orient by the Hungarians.

The old-time European swords used for cutting were nearly all straight, like the Ital. schiavona and spadron, the English and German two-handers and the Scotch claymore (see SWORD). There was indeed a heavy curved fencing weapon called dussack, very popular in the German fencing schools of the 16th and 17th centuries, which was of wood, very broad and as long as the fencer’s arm, with an elliptical hole for the hand in place of a guard. But the dussack was introduced from Bohemia, where, as in Hungary, swords were oriental in shape, and as it completely disappeared in the last half of the 17th century it can hardly be considered in any way as the ancestor of the modern sabre. The old English back-sword, the traditional English weapon, though the curved form was not quite unknown, was almost invariably straight. The ancient English sword-sabre-buckler play (see SABRE-FENCING) was, to the disgust of its devotees, driven out as a method of serious combat by the introduction at the beginning of the Elizabethan era of the Italian thrusting rapier. Nevertheless it survived as a sport up to the first half of the 18th century, being practised, together with the back-sword or broad-sword play, cudgelling or single-stick fencing, foiling and boxing, by the fencing masters of that period, whose exhibitions, given for the most part in the popular bear-gardens, were described by Pepys, Steele and others. The masters who figured in these “stage-fights” were called “prize-fighters”; and at that period they regarded boxing only as an unimportant part of their art. The most famous of them was Figg, the “Atlas of the Sword” (see FENCING). The back-sword of Figg’s time was essentially the military sword then in use, having a single straight edge. The blows were aimed at the head, body or legs. Towards the close of the 18th century sticks began to be used for back-swording, the play at first being aimed at any part of the person; but the head soon came to be the only object, and the stick, like the body and arms, being used only to gain an opening. The usual defence was from a high hanging guard. No lunging was allowed. Fencing with the broad-sword did not, however, at any period entirely disappear in England, and was taught by all the regular masters, especially by the celebrated Angelo. The earlier play, of the time of Figg and later, was simple and safe. The prevailing defensive position was the hanging guard, high or medium, with the arm extended and the point downwards. There were also high inside and outside, tierce, quarte, low prime, seconde, and the head or “St George,” parries; the last, a guard with the blade nearly horizontal above the head, being the supposed position of England’s patron saint from which he dealt his fatal blow at the dragon. Owing to the great weight of the old back-sword wrist-play was almost impossible, the cuts being delivered with a chopping stroke. Later in the 18th century a nimbler style, called the Austrian, came into fashion, owing to the introduction of a lighter, curved sabre, the principal guards being the medium, with extended hand and sword held perpendicularly with the point up; the hanging, with the point down, both outside and inside; the half-circle; the “St George”; and the spadron, with horizontal arm and sword pointing downwards. The spadron (Ital. spadrone), a light, straight, flat-bladed and two-edged sword, was also a popular 18th-century weapon, and was used both for cutting and thrusting. The thrusting attacks and parries were generally similar to those of the small-sword (see FOIL-FENCING), but few or no circular parries were used. The cuts were like those of the broad-sword. The Germans, like the British, were once masters of the edge in fencing, but the art declined with the introduction of the point, and sabre-playing survived only in the army and in academic circles with the heavy basket-sabre (see below).

The school of sabre still taught in most armies, and up to the end of the 19th century by fencing-masters of all countries except Italy and Austria-Hungary, shows little advance from that in vogue in Angelo’s time. Two fundamental guards are usual, (1) the guard (at the French army school at Joinville-le-Pont) corresponding to the guard of tierce in foil-fencing, except that the left forearm rests in the small of the back; and the other a high hanging guard, with crooked arm and the point of the sabre directed slightly downwards. The methods of coming on guard differ considerably, but have nothing to do with fencing proper. In 1866 the Florentine (Radallci) system of sabre was introduced into the British army, the cavaliere F. Masioi spending some time at Aldershot for the purpose of training the army swordsmasters; but since the year 1901 regular instruction in swords-manship has practically been abandoned.

Fencing on horseback for cavalry is simple in comparison with light sabre-play. The cavalry sword is of two patterns, one the heavy, straight cuissarier’s sword, and the other somewhat lighter with a slightly curved blade. On the attack straight
point thrusts, and wide sweeping cuts are used. The three principal parries are the "head" (or "high prime") with horizontally held blade; the "tirer," on the right, parrying cuts at the left side of the head and body; and the "quarte," on the opposite side.

The modern style of fencing with the light sabre was perfected in Italy during the last quarter of the 19th century, the most important pioneer in its development having been G. Radaelli, a Milanese master, who became chief instructor of the sabre in the Royal Italian Military Academy in 1874, when it was transferred from Milan to Parma. Radaelli's system was described by F. Masiello, an army officer whose works remain the chief authority on the light sabre. An old-time rivalry between the Neapolitan and the northern Italian fencing methods came to a crisis when M. Parié, an expert of the southern school, secured first place in foil-fencing in a tournament instituted by the military authorities, the result being the transfer of the Military Fencing Academy to Rome under the title of Scuola Magistrale di Roma. There was, however, less difference between the two schools in sabre than in foil play, and the Radaelli system for the former was so generally esteemed that a master of that method was established at the Roman Academy.

The light fencing-sabre is made up of two principal parts, the handle and the blade. The blade, from 33½ to 34 in. long and slightly and gradually curved from hilt to point (which is truncated), has the tongue, or tang, which runs through the handle; the heel, or thick uppermost part of the blade fitting on to the guard; the edge, running from heel to point; the back-edge or false-edge (sometimes not allowed), running from the point along the back for about 8 in.; and the back, running from point to heel (unless there is a back-edge). The blade is fitted on both sides from the heel where the back-edge begins. The handle consists of the guard, of thin metal, extending from the pommel to the heel of the blade, to protect the hand; the grip (of wood, fish-skin, or leather, often backed with metal), shaped to fit the hand, through which the tongue of the blade passes; and the pommel, or knob, a button which finishes off the handle and holds the tongue in place.

The recognition of the light fencing-sabre as a practice weapon only, related to the heavier military sword as the foil is to the duelling-sword, at once makes apparent the difference between the play of the two cut-and-thrust-weapons. As a light cut with the military sabre will be of little advantage in battle, however prettily delivered, it is evident that in order to produce a shock of impact sufficient to paralyze an adversary out of action, a wide sweeping movement with the sword (moscine; Ital. moschina) is necessary. With the fencing-sabre a hit is a hit if properly delivered with the edge or point, however light it may be. For his hit, 15½ in. less force is necessary, and wide moulinets are not only useless but dangerous, since in making them the point must for a moment be directed away from the opponent, and momentary openings are thus left of which the opponent may take advantage by attacks on the preparation. For this reason the cuts of the Radaelli school are delivered with moulinets of very narrow radius, made as much as possible by a movement of the elbow only, keeping the point directed menacingly towards the opponent. Again, whereas in battle a wound on any part of the person may be effective and the school of the heavy sabre has to reckon with this fact, in fencing with the light sabre no hit lower than the hips counts, although hits upon any part of the person above the hips are good; in England cuts on the outside of the thigh are allowed. This somewhat narrows the scope of the fencing-sabre, just as the scope of the foil is narrower than that of the cut-and-thrust.

The military sword is, on account of its weight; usually held firmly in the hand with the thumb overlapping the fingers; but in holding the light sabre the thumb is placed on the flat of the grip, giving a perfect command over the movements of the blade, called by the Italians pastegio. Both attacks and parries are executed as narrowly as possible, avoiding the wide movements common in heavy sabre-play, and the moulinets (which are ellipses described by the point as it is drawn back for a cut) are made, not by swinging the sword round the head, but by drawing back the hand held in front of the body, and with the point directed forward. The thrust with the sabre is made with the thumb to the left; whereas in the French school it is turned down, so that the blade curves upward. The modern school allows no such parries as the "St George," in executing which the blade is held at right angles to the body, but teaches that the point should always be directed towards the adversary as much as possible. The attacks are either "simple," "complex," or "secondary," and bear a general resemblance to those in foil-fencing (q.v.); simple attacks being such as are preceded by other movements, as feints; complex attacks those preceded by feints, advances, or some other preliminary manoeuvre; and secondary attacks those carried out while the adversary is himself attacking or preparing to attack. The parries also correspond in nomenclature, and generally in nature, to those used in foil-play, but no circular or counter-parries are taught, though sometimes employed.

Terms used in Sabre-Fencing. - Absence of the blade: a guard so wide as apparently to leave the body uncovered, so as to entice the adversary to attack. "Appuntata" (Fr. remise): a supplementary cut or thrust after the failure of an attack, when the adversary parries the first blow (see thrust, and assaults, Ital. assaliti), a regular blow. "Attacks on the blade" (see below under "thrust"): disarmament, "graze" and "press." "Beat" (Ital. battuta): a hard dry stroke on the adversary's blade, in order to drive it aside and to parry some advance made by being light on one side, then dropping the point quickly on the adversary's blade and beating violently on the other side. "Cavassone" (see below under "disengage"). "Completion" (see below under riposte). "Confrontation" (see above): to parry an attack in such a manner that the adversary is hit at the same time. "Deceive" (Ital. ingannare) when the adversary attempts an "attack on the blade," to avoid contact by a narrow circular movement of the point and hand; this is generally produced by a slight thrust or cut, as the force of his blow will carry his blade wide and leave an opening. "Development" (attacks on the): attacks made while the adversary is making a complex attack, i.e., one consisting of at least two movements (see etc.). "Disengage" (Ital. cavassone): being on guard (see guard) in order to drive an enemy's blade, or the adversary's sword and lunge on the other side to avoid a cut by a cut behind the left; a time-cut at the adversary's arm is usually made at the same time. "Grazie" (Ital. ghio): to run one's blade along the same general direction as the adversary's attack suddenly. "Guardeiguarda" (Fr. guarde); a guard in any one of the forms; generally so wide that the adversary lunges into the apparent opening, only to meet a prepared counter. "Incontro" (Ital. for double-hit); both main attacks or parries together. "Interdiction" (attacks); the four quarters in which the trunk is divided, the attacks and parries opposite them being called after them. These are, with the hand held in "supination" (thumb on top of sabre-grip): upper right, upper left, lower left, "tournant," "evaso," "octave" (not used in sabre); lower left "half-circle" (not used in sabre). When the hand is held in "pronation" (thumb down) the lines are: upper right, "tirer," upper left, "prime," lower right, "secondo," lower left, "point prime" (or "adverse" generally used). "Quinta" and "septime" are also lines of the Italian school. "Lunge": the advance of the body by stepping forward with the right foot in order to deliver a cut or thrust. "Opposition" (see below) a quick cut or thrust made after parrying an attack, without lunging. When the riposte in its turn is parried and replied to with another riposte, the French call this second riposte the "tac-a-tac." "Sforsa" (see disarmament). "Sforzata": a quick cut or thrust made after parrying an attack, without lunging. When the riposte in its turn is parried and replied to with another riposte, the French call this second riposte the "tac-a-tac." "Toccatol" (Ital. for "hit"). "Touché": French for "hit!"

Manchette-Fencing (Fr. manchette, a cuff) is a variety of sabre-play popular in Germany, in which the fencers stand at such a
SABZAWAR—SACCHARIC ACID

The German Basket-Sabre (Krummer Sabel, or Krumsöbel) is a descendant of the heavy cavalry sabre once in use in some branches of the German horse. It is now used almost exclusively by students. It has a strongly curved blade about 32 in. long and 1 in. broad, tapering slightly towards the end, which is truncated, no thrusts being allowed. The hand is protected by a large guard of heavy steel basket-work, and the handle is shaped to fit the hand, the forefinger being run through a leaflet horn. On account of the great weight of the weapon (about 2 3/4 lb, more than half of which is in the guard) blows delivered with a full swing are impracticable, and all cuts are made from the elbow and wrist, the hand being generally kept as high as possible. The Mensur is the distance at which the combatants stand from one another in the tests. There are many such distances, that in general use being the middle, from which two sabres can be crossed at about 15 ft. from the points. Neither combatant may move his left foot (the right in the case of a left-handed fencer) from the position in which it is placed at the beginning of the bout, all advances and retreats being made by the movements of the right foot and the body. The position of the engagement is in high tierce, the arm being held straight out towards the adversary. The feet are planted about 24 in. apart, the right in advance. The right shoulder is bent forward and the stomach drawn back, imparting a slight stoop to the fencer. There are eight cuts and as many parries. The basket-sabre is used in the more serious students' duels; the neck, wrist, armpits and body below the nipples being heavily bandaged.

Rapier-fencing among the students of the German universities and technical high-schools of Germany, Austria, Switzerland, and Russia may be considered under the sabre, as the rapier, although originally used for thrusting as well as cutting, is now employed by students only to cut. According to the association of German fencing masters, the weapon, whether blunt and used only for practice is called Rapier or Hauorapier, but when sharpened for duelling, Schlager (striker). It is derived from the long straight sword of the German Reiters, or light cavalry, who were famous in the 16th century and later. Its use, however, was only occasional before the middle of the 19th century, when it gradually took the place of the dangerous Parisier, or long French small-sword, for the semi-serious duels (Mensuren) of the students. There are two varieties of rapier, each having a thin flat blade about 33 3/4 in. long and 1 3/4 in. wide and truncated at the point, but distinguished by the shape of the handle. The bell-rapier (Glockenrapier), used only at the north German universities of Leipzig, Berlin, Halle, Breslau, Königsberg and Greifswald, is furnished with a guard consisting of a cup or bell of iron about 41 in. in diameter and 2 1/2 in. deep, joined to the pommel by a steel shaft protecting the hand. Its total weight is about 1 1/4 lb. The basket-rapier (Korbrapier), used at all universities except those named above, has a handle protected by a sort of basket of heavy steel, and its total weight is about 2 lb. The balance is just below the guard. The blade of the rapier is divided conventionally into the forte, the half next the hilt, and the joible. These are again divided into full and half forte and full and half joible, the half joible being the weakest quarter of the blade, nearest the point. Every cut, whether with sharp or blunt weapons, is preceded by the command Auf die Mensur! (on the mark, literally distance). The two fencers take position with feet apart and the right slightly in advance just far enough from one another to allow their heads to be reached by the sword without moving the feet, which remain firm during the entire bout. During the first half of the 19th century the objective points of the rapier included the upper arm and breast; but later the head, including the face, became the sole target. In practice a heavy mask of wire with felt top, a glove with padded arm-piece (Stulp) and a padded cap to protect body and legs are worn. There is one defensive position which is with the arm stretched upwardly bringing the hand and hilt about 6 in. in front of and above the forehead, and the point of the rapier directed diagonally downwardly across the body and to the outside of the adversary's knees. The fencers having at the command Bindet die Klingen! (Join blades!) place their hilts together with the points of the rapier directed upwards, attack simultaneously at the command Los! (Go!). All blows are delivered from the wrist, slightly helped by the forearm, the hand never being dropped below the level of the eyes. No movement of the head or body is allowed except as is unavoidably connected with that of the sword-arm.

Barbassetti (Vienna, 1898); a German translation of the foregoing, Das Sabelfechten (Vienna, 1899); Die Peilchskule, by Gustav; Hergsell (Vienna, 1892). For the old-style sabre see Cold Steel, by Alfred Hutton (London, 1889); Broadsword and Singleslicht, by R. G. Allanson (Vienna, 1898); and a German translation of the foregoing, Das Sabelfechten (Vienna, 1899); Die Peilchskule, by Gustav; Hergsell (Vienna, 1892). For the modern sword and schlagier, Die blinde Hiebenschule für Korb- und Glockenrapier (Leipzig, 1887), published by the association of German academic fencing-masters; L'Scierme dans les universités allemandes, &c., by L. C. Roux (Paris, 1885), a French exposition of the German student fencing.

SABZAWAR, a town of Afghanistan, situated at an elevation of 3550 ft. on the left bank of the river Harud, 93 m. S. of Herat. Sabzawar was once a city of considerable size, and still possesses a fortress with sides of about 200 or 250 yds. This fortress has been abandoned, and the town, which is the centre of a group of villages, is now fairly prosperous, with a bazaar of about 800 shops and a busy traffic with Seistan. The plains about Sabzawar are highly cultivated by the Persians, Nauruz, Durians, and each village boasts its own little mud fort.

SABZEVAR, a district of the province of Khorasan in Persia, formerly called Baihak. It is situated between Nishapur on the east and Shahroud-Bostam on the west, and has a length of about 80 m. and a breadth of 50; its population is about 60,000, and it pays to the government a yearly revenue of 8000. The district has many flourishing villages and much cultivation; it produces much wool, excellent cotton, some silk, partly exported to Russia, partly manufactured into various stuffs in the district, and fruits, exported dried in large quantities. The export trade is chiefly done by a few Russian Armenians who reside in Sabzevar town.

SABZEVAR, the capital of the district, is situated 150 m. E. of Shahroud and 65 m. W. of Nishapur, in 36° 12' N., 57° 39' E., at an elevation of 3100 ft. The population, which was 30,000 before the famine in 1871, is now about 15,000. There are some good caravanserais, a well-supplied bazaar, three colleges, large and thirty small mosques, and post and telegraph offices.

SACCHARIC ACID, C(4H8O)OH, or HOC(4H-OH)4CHOH, in chemistry, a tetraoxydcarboxylic acid which exists in three stereoisomeric forms. The ordinary or dextro (d)-saccharic acid is formed in the oxidation of cane sugar, grape sugar, d-gluconic acid and many other carbohydrates with nitric acid. It forms a deliquescent mass. On standing, the syrupy acid gives the crystalline lactonic acid, C(4H8O)2OH. Sodium amalgam reduces it to glucuronic acid, C(4H8O)2OH or OHC(4H-OH)4CHOH, whilst hydroxyl acid reduces it to adipic acid, HOC(4H2O)4CHOH. Nitrile acid oxidizes it to dextro-tartaric acid and oxalic acid. L-Levul- (l)-saccharic acid is formed by oxidizing i-gluconic acid with nitric acid, whilst the inactive (d+)-acid is obtained similarly from inactive gluconic acid. These acids closely resemble the d acid except in their action on polarized light. For their relations
to the glucose see Sugar. Mucoic acid (q.t.) is isomeric with these acids.

SACCHARIN, the name given to several distinct chemical substances. The saccharin of commerce, so named from its excessively sweet taste, is a coal-tar product, being the imide of ortho-sulphobenzoic acid, \( \text{C}_8\text{H}_4(\text{CO})\text{SO}_2\text{NH} \). It may be prepared by the oxidation of ortho-toluensulphonamide \( \text{C}_8\text{H}_7\text{CH}_2\text{SO}_2\text{NH} \), with potassium permanganate (C. Fahlgren and I. Rensmen, Ber., 1879, 12, p. 460); by the electrolytic oxidation of the above sulphonamide (German patent 35211); by the action of concentrated sulphuric acid on ortho-sulphamidobenzoic acid, \( \text{H}_2\text{SO}_4\text{C}_8\text{H}_7\text{CH}_2\text{CO}_2\text{H} \) (German patent 113780); by the action of heat on ortho-sulphobenzoic acid phenylates (\( \text{SO}_2\text{Cl}\text{C}_8\text{H}_7\text{CH}_2\text{CO}_2\text{H} \)) with excess of aqueous ammonia (R. List and M. Stein, Ber., 1898, 31, p. 1663); and from benzaldehyde ortho-sulphonic acid by conversion into its acid chloride, which with ammonia yields the corresponding acid-amide, which gives saccharin on oxidation with atmospheric oxygen (German patent 90498). It is a crystalline powder which melts at 220° C. with partial decomposition. It is soluble in cold water, but is moderately soluble in hot water and readily soluble in alcohol. By the action of concentrated hydrochloric acid at 150° C. it is decomposed into ammonia and ortho-sulphobenzoic acid. With phosphorus pentachloride above 200° C. it yields orthochlorotoluene. Sodium saccharin, \( \text{C}_8\text{H}_7(\text{CO})\text{(SO)}\text{Na}_2 \), is used under the name of "soluble saccharin" or "crystalline," and is readily soluble in hot water. The ammonium salt is named "sacramine." Saccharin is largely used for sweetening purposes, pure saccharin being 300 times sweeter than sugar. Until 1891 the commercial product contained about 40% of the tarry paste compound and was only 300 times as sweet as sugar; the mixture, however, is now separated by dissolving out the saccharin with xylene, in which solvent the para compound is insoluble. Saccharin is used as a sugar substitute for diabetic patients. It is interesting to note that o-sulphobenzoic acid has an acid taste, and the sulphamide is tasteless; the sweetness of saccharin therefore appears to be connected with the formation of a cyclic anhydride. In the United Kingdom there is an import duty of 14.3d. per oz. on saccharin and similar products, and manufacturers have to take out a licence. In the United States the import duty is $1.50-10% ad valorem per lb. Austria-Hungary, France, Belgium and Germany prohibit the importation. The estimation of saccharin in commercial samples and for its detection in foods and beverages see J. H. Kastle, Jour. Chem. Soc., 1905, 87, p. 503; E. M'K. Chace, Jour. Amer. Chem. Soc., 1904, 39, p. 1627.

The lactones of the saccharic acids are also known as "saccharins." By boiling dextrin or laevulose with milk of lime the so-called "saccharin," a lactone of the formula,

\[ \text{CH}_2\text{OH} \text{CH}_2\text{CHO} \text{CH}_2\text{SO}_2\text{NH} \]

is obtained (E. Pfligget, Ber., 1880, 13, p. 196; H. Killiani, Ber., 1882, 15, p. 2954). It crystallizes in large prisms, has a bitter taste, and is easily soluble in hot water. Potassium permanganate oxidizes it to carbonic and acetic acids. Heating with caustic potash to 200° C. gives formic and lactic acids, and when reduced by hydriodic acid and alcohol it is converted into ethyl-methyl-ammoniates. "Iso-saccharin" and "meta-saccharin" are formed by the action of lime on milk sugar (H. Killiani, Ber., 1885, 18, p. 631). The former melts at 95° C., and on reduction by hydriodic acid and phosphorus of ortho-sulphophenolic acid phenylates at 141-142° C. and is easily soluble in water.

SACCHETTI, FRANCO (c. 1335-c. 1400), Italian poet and novelist, was the son of Benci di Ugucione, surnamed "Buono," of the noble and ancient Florentine family of the Sacchetti (comp. Dante, Par. xvi.), and was born at Florence about the year 1335. While still a young man he achieved a reputation as a poet, and he appears to have travelled on affairs of more or less importance as far as to Genoa, Milan and "Ischiaivia." When a sentence of banishment was passed upon the rest of the house of Sacchetti by the Florentine authorities in 1380 it appears that Franco was expressly exempted, "per esser tanto uomo buono," and in 1383 he was one of the "eight," discharging the office of "prior" for the months of March and April. In 1385 he was chosen ambassador to Genoa, but preferred to go as legate to Bibbiena in Casentino. In 1392 he was podestà of San Miniato, and in 1396 he held a similar office at Faenza. In 1398 he received from his fellow-citizens the post of captain of their then province of Romagna, having his residence at Portico. The date of his death is unknown; most probably it occurred about 1400, though some writers place it as late as 1410.

Sacchetti left a considerable number of sonnetti, canzoni, ballate, madrigali, &c., which have never been printed, but which are still extant in at least one MS. in the Laurentian library of Florence. His Novelle were first printed in 1744, from the MS. in the same collection, which, however, is far from complete. They were originally 300 in number, but only 258 in whole or in part now survive. They are written in pure and elegant Tuscan, and, based as they are on the traditions of the day, present a vivid outline of the domestic life of Florence, they are valuable for the light they throw on the manners of that age, and occasionally also for the biographical facts preserved in them.

SACCHI, ANDREA (c. 1600-1661), Italian painter of the later Roman school, was born at Nettuno near Rome in 1600, or perhaps as early as 1598. His father, Benedetto, a painter of undistinguished position, gave him his earliest instruction in the art; Andrea then passed into the studio of Albani, of whom he was the last and the most eminent pupil, and under Albani he made his reputation early. The painter of Sacchi's pre-dilection was Raphael; his own pictures are often compared to those of Raffaello da Cortona, and more especially of Bernini. In process of time he became one of the most learned designers and one of the soundest colourists of the Roman school. He went to Venice and to Parma to study Venetian colour and the style of Correggio; but he found the last-named master unadaptable for his own proper methods in art, and he returned to Rome. Sacchi was strong in artistic theory, and in practice slow and fastidious; it was his axiom that the merit of a painter consists in producing, not many middling pictures, but a few and perfect ones. His works have dignity, repose, elevated yet natural forms, severe but not the less pleasing colour, a learned treatment of architecture and perspective; he is thus a painter of the correct and laudable academic order, admired by connoisseurs rather than by ambitious students or the large public. His principal painting, often spoken of as the fourth best easel-picture in Rome—in the Vatican Gallery—is "St Romuald relating his Vision to Five of his Knights of the Order of St Benedict". "True of" a Vision with these figures who are all in the white garb of their order, has often been remarked upon; and as often the ingenuity and judgment of Sacchi have been praised in varying the tints of these habits according to the light and shade cast by a neighbouring tree. The Vatican Gallery contains also an early painting of the master—the "Miracle of St Gregory," executed in 1624; a mosaic of it was made in 1771 and placed in St Peter's. Other leading examples are the "Death of St Anna," in S Carlo ai Catinari; "St Andrew," in the Quirinal; "St Joseph," at Cape allo Cæse; also, in fresco, a ceiling in the Palazzo Barberini—"Divine Wisdom"—reckoned superior in expression and selection to the rival work of Pietro da Cortona. There are likewise altar-pieces in Perugia, Foligno and Camerino. Sacchi, who worked almost always in Rome, left few pictures visible in private galleries: one, of "St Bruno," is in Grosvenor House. He had a flourishing school: Nicholas Poussin and Carlo Maratta were his most eminent scholars; Luigi Garzi and Franceschini were other artists who studied under Sacchi. The son Giuseppe, who died young, after giving very high hopes. This must have been an illegitimate son, for Andrea was unmarried when he died at Nettuno in 1661.

SACCHINI, ANTONIO MARIA GASPARE (1734-1786), Italian musical composer, was born at Pozzuoli, on the 23rd of July 1734. He was the son of a poor fisherman and was heard singing on the sands by Durante, who undertook his education at the Conservatorio di Sant' Onofrio at Naples. Durante and Piccinini taught him composition, and Nicola Fiorenza the violin. The intermezzi Fra Donato was written for the theatre of the Conservatorio in 1756, but his first serious opera was produced at Rome in 1762, and was followed by many others, nearly all of which were successful. In 1769 he went to Venice, and in consequence of the great success achieved there by the
SACERDOTALISM—SACHEVERELL, W.

971

production of his opera _Alessandro nell' Indie_ he was appointed director of the Conservatorio dell' Ospedaletto, where he trained some admirable female singers and wrote church music. In 1772 he visited London, where, notwithstanding a cruel cabal formed against him, he achieved a brilliant success, especially in his four new operas, _Tamerlano, Lucio Vero, Notti e Perso_ and _Il Gran Cid_. Later he met with an equally enthusiastic reception in Paris, where in 1783 his _Rinaldo_ was produced under the immediate patronage of Queen Marie Antoinette, to whom he had been recommended by the emperor Joseph II. But neither in England nor in France did his reputation continue to the end of his visit. He seems everywhere to have been the victim of bitter jealousy. Even Marie Antoinette was not able to support his cause in the face of the general outcry against the favour shown to foreigners; and by her command, given with the utmost reluctance, his last opera and undoubted masterpiece, _Edipe a Colone_ , was set aside in 1786 to make room for Lemoine's _Phédre_ —a circumstance which so preyed upon his mind that he died of chagrin on the 7th (or 8th) of October 1786.

Sacchi's style was rather graceful than elevated, and he was deficient both in creative power and originality. But the dramatic truth of his operas, more especially the later ones, is above all praise, and he never fails to write with the care and finish of a thorough and accomplished musician. _Edipe_ was extremely successful after his death, and was performed at the Académie nearly six hundred times.

SACERDOTALISM (from Lat. _sacer_, priest, literally one who presents sacred offerings, _sacrum_, sacred, and _dare_, to give), a term applied, usually in a hostile sense, to the system, method and spirit of a priestly order or class, under which the functions, dignity and influence of the members of the priesthood are exalted in the ministry of religion, and in the church at the expense of the laity. This exalting of the priesthood in the Christian church is based on the claim that the priest exercises sacrificial and supernaturnal powers in the celebration of the Eucharist.

*SACHEVERELL, HENRY* (1674–1710), the most conspicuous sacerdotalist and politician, was the son of John Sacheverell, rector of St Peter's, Marlborough. He was adopted by his godfather, Edward Heath, and his wife, and was sent to Magdalen College, Oxford, in 1689, was demy of his college from 1689 to 1701 and fellow from 1701 to 1713. Addison, another Wiltshire lad, entered at the same college two years earlier, but was also elected a demy in 1689; he inscribed to Sacheverell in 1694 his account of the greatest English poets. Sacheverell took his degree of B.A. in 1693, and became M.A. in 1695 and D.D. in 1698. His first preferment was the small vicarage of Cannock in Staffordshire; but he leapt into notice when holding a preachership at St Saviour's, Southwark. His famous sermons on the church in danger from the neglect of the Whig ministry to keep guard over its interests were preached, the one at Derby on the 15th of August, the other at St Paul's Cathedral on the 5th of November 1700. They were immediately reprinted, the latter being dedicated to Sir Robert Walpole, and the former to the Duke of Shrewsbury. George Sacheverell, high sheriff of Derby for the year; and, as the passions of the whole British population were at this period keenly exercised between the rival factions of Whig and Tory, the vehement invectives of this furious divine on behalf of an ecclesiastical institution which supplied the bulk of the adherents of the Tories made him their idol. The Whig ministry, then slowly but surely losing the support of the country, were divided in opinion as to the propriety of prosecuting this zealous parson. Somers was against such a measure; but Godolphin, who believed to be personally alluded to in one of these harangues under the nickname of “Volpone,” urged the necessity of a prosecution, and gained the day. The trial lasted from 27th February to 23rd March 1710, and the verdict was that Sacheverell should be suspended for three years and that the two sermons should be burnt at the Royal Exchange. This was the decree of the state, and it had the effect of making him a martyr in the eyes of the populace and of bringing about the downfall of the ministry. Immediately on the expiration of his sentence (13th April 1713) he was instituted to the valuable rectory of St Andrew's, Holborn, by the new Tory ministry, who despaired the author of the sermons, although they dreaded his influence over the mob. He died at the Grove, Highgate, on the 5th of June 1724.

See Hearne's _Diaries_, Bloxam's _Register of Magdalens_ and Hill Burton's _Queen Anne_, vol. ii. There is an excellent bibliography by Falconer Madan (1887).

SACHEVERELL, WILLIAM (1638–1691), English statesman, son of Henry Sacheverell, a country gentleman, was born in 1638. His family had held a good position in Derbyshire and Nottinghamshire since the 12th century, the name appearing as Sacheverell in the roll of Battle Abbey, and William inherited large estates from his father. He was admitted at Gray's Inn in 1657, and in 1670 he was elected member of parliament for Derbyshire. He immediately gained a prominent position in the party hostile to the Court, and before he had been six months in the House of Commons he proposed a resolution that all "popish recusants" should be removed from military commands; the motion, enlarged so as to include civil employment, was carried without a division on the 28th of February 1672–1673. This resolution was the forerunner of the Test Act, in the preparation of which Sacheverell took an active part, and which caused the break up of the cabal. He now took part in nearly every debate in the House of Commons, being recognized as one of the most able of the leaders of the opposition or country party. He strongly opposed the king's policy of alliance with France, advocating a league with the Dutch instead, and the refusal of supplies until the demands of the Commons should be complied with. Sacheverell took especial interest in the state of the navy and spoke in many debates on this question. In 1677 he carried an address to the king calling upon him to conclude an alliance with the United Provinces against Louis XIV., and when the Speaker adjourned the House by Charles's order Sacheverell made an eloquent protest, asserting the right of the House itself to decide the question of its adjournment.

When Parliament met early in 1678 assurances were received from Charles II. that he would not proceed by the Commons; but Sacheverell boldly questioned the king's good faith, and warned the Commons that they were being deceived. When the secret treaty with France became known, thus confirming Sacheverell's insight, the latter called for the disbandment of the forces and advocated the refusal of further supplies for military purposes; and in June 1678 he resolutely opposed Lord Danby's proposal to grant £500,000 per annum to Charles II. for life. Barillon mentions Sacheverell among the Whig leaders who accepted bribes from Louis XIV., but the evidence against him is not conclusive.

When Titus Oates began his pretended revelations in 1678 Sacheverell was among those who most firmly believed in the existence of a Popish plot. He was one of the most active investigators of the affair, and one of the managers of the impeachment of the five Catholic peers. He also acted for a time as the leader of the committee of the Commons, and drew up the report on the impeachment of the Jesuit Coleman, secretary to the duchess of York. He was a member of the committee for drafting the articles of impeachment against Danby in 1678, and was appointed one of the managers of the Commons; and in 1679, when the impeachment, interrupted by the dissolution of parliament, was resumed in the new parliament, he spoke strongly against the validity of Danby's plea of pardon by the king. The allegations made in Sacheverell's report on the examination of Coleman prompted the country party to demand the exclusion of James, duke of York, from the succession to the throne, the first suggestion of the famous Exclusion Bill being made by Sacheverell on the 4th of November 1678 in a debate—"the greatest that ever was in Parliament," as it was pronounced by contemporaries—raised by Lord Russell with the object of removing the duke from the King's Council. He vigorously promoted the bill in the House of Commons and opposed granting supplies till it should pass. When Charles offered an alternative scheme (1679) for limiting the powers of a Catholic sovereign, Sacheverell made a great speech in which he pointed out the
insufficiency of the king's terms for securing the object desired by the Whigs. In the conflict between the Petitioners and the Abhorrers he supported the former, and on the 27th of October 1689 brought forward a motion asserting the right of petitioning the king to summon parliament, and proposed the impeachment of Chief Justice North as the author of the proclamation against tumultuous petitioning. Sacheverell was one of the managers on behalf of the Commons at the trial of Lord Stafford in Westminster Hall; but took no further part in public affairs till after the elections of March 1681, when he was returned unopposed for Derbyshire. He was prosecuted for riot in connexion with the surrender of the charter of Nottingham in 1682, being tried before Chief Justice Jeffreys, who fined him 500 marks.

At the general election following the death of Charles II. in 1685, Sacheverell lost his seat, and for the next four years he lived in retirement on his estates. In the convention parliament summoned by the prince of Orange, in which he sat for Heytesbury, he spoke in favour of a radical reform of the constitution, and served on a committee, of which Somers was chairman, for drawing up a new constitution in the form of the Declaration of Right; and he was one of the representatives of the Commons in their conference with the peers on the question of declaring the throne vacant. William III. appointed Sacheverell a lord of the admiralty, but he resigned the office after a few months. He procured the omission of Lord Jeffreys's name from the Act of Indemnity. In 1690 he moved a famous amendment to the Corporation Bill, proposing the addition of a clause—the purport of which was misrepresented by Macaulay—for disqualifying for office for seven years municipal functionaries who in defiance of the majority of their colleagues had surrendered their charters to the Crown. A celebrated debate on this question took place in the House of Commons in January 1690; but the evident intention of the Whigs to perpetuate their own ascendancy by tampering with the franchise contributed largely to the Tory return of Charles Churchill, and secured for Sacheverell the vacant seat of Northampton. In that year Sacheverell was elected member for Nottinghamshire; but he died on the 9th of October 1691, before taking his seat.

In the judgment of Speaker Onslow, Sacheverell was the "ablest parliament man" of the reign of Charles II. He was one of the earliest of English parliamentary orators; his speech greatly impressed his contemporaries, and in a later generation, as Macaulay observes, they were "a favourite theme of old men who lived to see the conflicts of Walpole and Pulteney." Though his fame has become dimmed in comparison with that of Shaftesbury, Russell and Sidney, he was not less conspicuous in the parliamentary proceedings of Charles II.'s reign, and he left a more permanent mark than any of them on the constitutional changes of the period.

Sacheverell was twice married. His first wife was Mary, daughter of William Staunton of Staunton; and his second was Jane, daughter of Sir John Newton. His son Robert represented the borough of Nottingham in six parliaments and died in 1714. The family became extinct in 1724.

SACHS, HANS (1494-1576), German poet and dramatist, was born at Nuremberg on the 5th of November 1494. His father was a tailor, and he himself was trained to the calling of a shoemaker. Before this, however, he received a good education at the Latin school of Nuremberg, which left behind it a lasting interest in the stories of antiquity. In the spring of 1508 he began his apprenticeship, and was at the same time initiated into the art of the Meistersingers by a weaver, Leonhard Nunnenpeck. In 1511 he set out on his Wanderjahre, and worked at his craft in many towns, including Regensburg, Passau, Salzburg, Munich, Nurnsbruck, Luueck and Leipzig. In 1516 he returned to Nuremberg, where he remained during the rest of his life, working steadily at his handicraft and devoting his leisure time to literature. In 1527 he became master of his guild and in 1540 married. The great event of his intellectual life was the coming of the Reformation; he became an ardent adherent of Luther, and in 1523 wrote in Luther's honour the poem beginning Die wittenbergisch Nachtigall, Die man jetzt koret uberr, and four remarkable dialogues in prose, in which his warm sympathy with the reformer is tempered by counsels of moderation. In spite of this, his advocacy of the new faith brought upon him a reproof from the town council of Nuremberg; and he was forbidden to publish any more Buehlein oder Reimen. It was not long, however, before the council itself openly threw in its lot with the Reformation. After the death of Hans Sachs's first wife in 1560 he married again. His death took place on the 31st of January 1576.

Hans Sachs was an extraordinarily fertile poet. By the year 1560 he had composed, according to his own account, 4275 Meisterlieder, 1700 tales and fables in verse, and 208 dramas, which filled no fewer than 34 large manuscript volumes; and this was not all, for he continued writing until 1573. The Meisterlieder were not printed, being intended solely for the use of the Nuremberg Meistersinger school, of which Sachs was the leading spirit. His fame rests mainly on the Spruchgedichte, which include his dramatic writings. His "tragedies" and "comedies" are, however, little more than stories told in dialogue, and divided at convenient pauses into a varying number of acts; of the essentials of dramatic construction or the nature of dramatic action Sachs has little idea. The subjects are drawn from the most varied sources, the Bible, the classics and the Italian novelists being especially laid under contribution. He succeeds best in the short anecdotal Pastnachtspiel or Shrovetide play, where he could imitate the manner of the editorial writers, as opposed to dramatic form or construction. 'Farces like Der Jahrrede Schuler im Paradies (1530), Das Wildbad (1530), Das heilte Eisen (1553), Der Bauer im Fegefeuer (1552) are inimitable in their way, and have even been played with success on the modern stage.

Hans Sachs himself made a beginning to an edition of his collected writings by publishing three large folio volumes (1555-1561); after his death two other volumes appeared (1578, 1579). A critical edition has been published by the SchweizerischeLiterarischen Verein, edited by A. von Keller and E. Goethe (23 vols., 1870-1896); Samentliche Pastnachtspiele, ed. by E. Goethe (7 vols., 1880-1887); Samentliche Spruchgedichte und Lieder (3 vols., 1893). There are also editions of selected writings by J. Timm (4th ed., 1883-1895) and B. Arnold (2 vols., 1885). See E. K. Lutzlerger, Hans Sachs (1876); C. Schweitzer, Etude sur la vie et les Oeuvres de Hans Sachs (1878); Die Schriftsteller der deutschen Renaissance-Studien (1890, 1891); E. Goethe, Hans Sachs (1891); A. L. Siegel, Hans Sachs-Forschungen (1894); R. Genbe, Hans Sachs und seine Zeit (1894, 2nd ed., 1902); E. Geiger, Hans Sachs als Dichter in seinen Pastnachtspielen (1904).

SACHS, JULIUS von (1832-1897), German botanist, was born at Breslau on the 2nd of October 1832. At an early age he showed a taste for natural history, and on leaving school he became, in 1851, private assistant to the physiologist J. E. Purkinje at Prague. In 1856 he graduated as doctor of philosophy, and then adopted a botanical career, establishing himself as Privatdozent for plant physiology in the university of Prague. In 1859 he was appointed physiological assistant to the Agricultural Academy of Tharandt in Saxony; and in 1861 he was called to be director of the Polytechnic at Chemnitz, but was almost immediately transferred to the Agricultural Academy at Poppelsdorf, near Bonn, where he remained until 1867, when he was nominated professor of botany in the university of Freiburg-im-Breisgau. In 1868 he accepted the chair of botany in the university of Würzburg, which he continued to occupy (in spite of calls to all the important German universities) until his death at Würzburg on the 10th of May 1897.

Sachs achieved distinction as an investigator, a writer and a teacher; his name will ever be especially associated with the great development of plant physiology which marked the latter half of the 19th century, though there is scarcely a branch of
botany to which he did not materially contribute. His earlier papers, scattered through the volumes of botanical journals and of the publications of learned societies (a collected edition was published in 1859–93), are of great and varied interest. Prominent among them is the series of "Kelmungsgeschichten," which laid the foundation of our knowledge of microchemical methods, as also of the morphological and physiological details of germination. Then there is his resuscitation of the method of "water-culture," and the application of it to the investigation of the problems of nutrition; and further, his discovery that the starch-grains to be found in chloroplasts are the first visible product of their assimilatory activity. His later papers were almost exclusively published in the three volumes of the *Arbeiten des botanischen Institutes in Würzburg* (1871–88). Among these are his investigation of the periodicity of growth in length, in connexion with which he devised the self-registering auxanometer, by which he established the retarding influence of the highly refrangible rays of the spectrum on the rate of growth; his researches on heliotropism and geotropism, in which he introduced the "clinostat"; his work on the structure and the arrangement of cells in growing-points; the elaborate experimental evidence upon which he based his "imibition-theory" of the transpiration-current; his exhaustive study of the assimilation of oxygen. Sachs' first published volume was the *Handbuch der Experimentalphysiologie der Pflanzen* (1865; French edition, 1868), which gives an admirable account of the state of knowledge in certain departments of the subject, and includes a great deal of original information. This was followed in 1868 by the first edition of his famous *Lehrbuch der Botanik*, by far the best book of its kind. It is a comprehensive work, giving an able summary of the botanical science of the period, enriched with the results of many original investigations. The fourth and last German edition was published in 1874, and two English editions were issued by the Oxford Press in 1875 and 1882 respectively. The *Lehrbuch* was eventually superseded by the *Vorlesungen über Pflanzenphysiologie* (1st ed., 1882; 2nd ed., 1887; Eng. ed., Oxford, 1887), a work more limited in scope, but yet covering more ground than its title would imply; though it is a remarkable book, it has not gained the general recognition accorded to the *Lehrbuch*. Finally, there is the *Geschichte der Botanik* (1873), a brilliant and learned account of the development of the various branches of botanical science from the middle of the 16th century to the present day, which the English edition was published by the Oxford Press. As a teacher Sachs exerted great influence, for his vigorous personality and his ready and lucid utterance enabled him not only to instruct, but to fire his students with something of his own enthusiasm.

A full account of Sachs' life and work was given by Professor Goebel, formerly his assistant, in *Flora* (1897), of which an English translation appeared in *Science Progress* for 1898. There is also an obituary notice of him in the *Proc. Roy. Soc. vol. lix. (S. H. V.*)

**SAKS, MICHAEL** (1808–1864), German Rabbi. He was one of the first of Jewish graduates of the modern universities, taking his Ph.D. degree in 1836. He was appointed Rabbi in Prague in 1836, and in Berlin in 1844. He took the conservative side against the Reform agitation, and so strongly opposed the introduction of the organ into the Synagogue that he retired from the Rabbinate rather than acquiesce. Sachs was one of the greatest preachers of his age, and published two volumes of Sermons (*Predigten*, 1866–1891). He co-operated with Zunz (q.v.) in a new translation of the Bible. Sachs is best remembered for his work on Hebrew poetry, *Religiöse Poesie der Juden in Spanien* (1845); his more ambitious critical work (*Beiträge zur Sprach- und Altertumsforschung*, 2 vols., 1852–1854) is of less lasting value. His poetical gifts he turned to admirable account in his translation of the Festival Prayers (Mahzor, 9 vols., 1853), a new teature of which was the metrical rendering of the medieval Hebrew hymns. Another very popular work by Sachs contains poetical paraphrases of Rabbinic legends (*Stimmen vom Jordan und Euphrat*, 1853).

**SACKBUT**, a large bag made of a coarse material such as is described under SACKING below. The name occurs with very little variation in all European languages, e.g., Ger. *sack*, Lat. *sacca*, Fr. *sac*, Sp. *saco*, Du. *sak*, &c. All are borrowed from the Hebrew *sag*, properly a coarse stuff made of hair, hence a bag made of this material. Most etymologists attribute the widespread occurrence of the word to the story of Joseph and his brethren in Gen. xliv. The Hebrew word itself is probably Egyptian, as is evidenced by the Coptic *sok*. Apart from its ordinary meaning, the word is used as a unit of dry measure, which has varied considerably at different times and places and for 'different goods; it is the customary British measure for coals, potatoes, apples and some other goods, and is equivalent to three bushels. From the end of the 17th to the middle of the 18th century the sack or "sacque" was a fashionable type of gown for women, having a long flowing loose back—hanging in pleats from the neck. It is still used as a tailor's or dressmaker's term for a loose straight-back coat. The Fr. *sac* meant also pilillage, plunder, whence *saccager*, to plunder a town, especially after it had been taken by assault or after a siege. There is no doubt that it is an extension of "sack," a bag, with a reference to the most obvious receptacle for booty. The slang expression "to give the sack" is a diminutive of *sack*, a term for a person who has been turned out to the streets. It is most likely derived from a situation being given a discharge, an old French proverbial expression. Cotgrave gives *On tuy a donné sa sac et ses guilles*, "he hath his passport given him, he is turned out to grazing, said of a servant whom his master hath put away." The New English Dictionary finds the expression also in 15th-century Dutch.

It remains to distinguish the name, familiar from English literature of the 16th and 17th centuries, of a Spanish wine, which was of a strong, rough, dry kind (in Fr. *vin sec*, whence the name), and therefore usually sweetened and mixed with spice and mulled or "burnt." It became a common name for all the stronger white wines of the South.

**SACKBUT, SHAKRUSHE, SAGBUT, DRAW OR DRAWING TRUMPET (Scotland, draught trumpet) or FLAT TRUMPET (Fr. *saquebute*, saqueboute, sacabouc, trompette harmonique; Ger. Posaune, Busaun, Pusin, Zug-Trompet; Itl. tromba da tirarsi o tromba spezzata; Span. sacabuche; Dutch *basuin (Schuijftrompet)*, the earliest form of slide trumpet, which afterwards developed into the trombone. As soon as the effect of the slide in lengthening the main tube and therefore proportionately to its circumference became known, the instrument Dick was understood, and its capabilities had been fully realized, the development of a family of powerful tenor and bass instruments followed as a matter of course. It is not known exactly in what country the principle of the slide was first discovered and applied to musical instruments; if it be not an Oriental device, then the credit is probably due to the Netherlands or to South Germany before or during the 13th century.

The early history of the sackbut is among the most interesting of all instruments. Various attempts have been made to fix the etymology of the word as derived from Span. *sacabuche* through French *saquebute* to *sacabouche*; The Rev. F. H. Seeley suggests a derivation from *sacar*, to draw out, and *buche*, identical with *bucha* (Lat. *busus*), used in the sense of a tube or pipe originally of boxwood. To accept this etymology would be to lose sight of the fact that all the technical names apply to the tubular or cylindrical receptacle of the instrument which is known to English-speaking peoples after the conquest introduced oriental musical instruments by way of Spain to western Europe, but the Arabic names also clung to the instruments in many cases. The Arabs had a military trumpet they called *Buk* or *Buque*, a word they had borrowed from the Christians, and it is mentioned in the Arabic treatise of the 14th century (Esaral MS. 69) among the musical instruments then in use in Spain. It has been claimed on philological grounds that England derived her knowledge of the sackbut from France, but the oldest known form of the word in English is *shakrusshe*, which occurs in the accounts of Henry VII. 

SACKETT'S HARBOR

for the 3rd of May 1495,5 and is obviously of Spanish origin. Sackbut appears early in the 16th century.

The word *sacabuche* was at some time applied in Spain to the ship's pump; and the questions naturally arise, Which came first, and Was the musical instrument developed before the pump from the great resemblance in their respective actions as well as in outward form? 2

It is certainly significant that the Ital. *tromba*, from which sprang "trumpet" and "trombone," means a pump as well as a trumpet and the trunk of an elephant, and that doubt that the slide had been applied to the trumpet before the word *tromba* was used for it, there would still remain several difficulties to be disposed of. 1 (1) The word *trumbarum, tromba*, already generalized in the renascence, was at first applied to the tubas and curved horns, probably from the similar curve of the elephant's trunk. (2) If *tromba* referred to the pump, it must have been applied to the slide trumpet, and *tromba da tirarsi* for "sacabuche" as nonsense tautology. (3) The style given above from *buk* or *buque*, trumpet, supported by similarly compounded words in English, Scotch, Dutch, Italian, would have to be regarded as a strange but not unparalleled philological coincidence. The earliest instance yet discovered of the use of *sacabuche* as a musical instrument seems to be in the 14th century.

The transformation of the busine (buccina) into the sackbut involved two or three processes, the addition of the slide being accomplished in at least two stages. It was first applied to the straight busine made in three or four sections having rings or knobs at the joints. The sliding portions or joints here doubtless served much as in our modern wood wind instruments for tuning purposes or for changing the registers. The busine has been compared to a diapason compass, with an additional step in the evolution, when applied to the straight busine it differed materially from the slide of the sackbut or trombone, for the normal position of the instrument was such that the lips of the slide would be of the same length as, and would closely follow, the slide being generally closed the pitch was proportionally raised in order to fill in the gaps of the first fifth by new fundamentals, upon each of which the harmonic series would be obtainable. A C minor scale (that is, the first five notes found in a miniature from a psalterium executed in the south of France during the 13th century, now preserved in the library of the university of Munich (MS. 24, 410 fol. 960). Here (fig. 1) the position of the slide is given with that of the slide trumpet, showing on which of the sections or rings denoting the joints or sections are shown touching each other. The hand is grasping the instrument just under the lower hand and the slide is in one of its key positions, such as the one shown in fig. 2 close to the slide, as is indicated by the position of the wrist. This is the earliest indication of the existence of the slide yet found by the writer, and the instrument, although straight, is one of the earliest sackbutts. The manipulation of the slide on the long straight busine must have been exceedingly difficult, requiring not only skill, but also the arm, the next step in the evolution, i.e. the bending of the tube in three parallel branches like a flattened S, an example of which, also of the 13th century, is found on some carved wood work from the abbey of Cluny.6

The folding of the busine marks the advent of the new double slide, which was made to draw out and lower the pitch. This radical change did not come all at once, the intermediate step being the folding of the busine, with the old single slide, the whole S being drawn up and down, as the slide closed and opened again. This interesting development is shown (fig. 2) in a miniature by Taddeo Crivelli in the Borso Bible (1450-1472). The two upper joints defined by rings are clearly drawn of larger calibre than the lower folded portion, which has been drawn out to what would approximately correspond to the third position on the slide of the trombone lowering the pitch one tone. A single slide would require more bent about twice the distance of the double or folded tube on the trombone to produce any given effect. This drawing of the sackbut must not be taken as showing the instrument in use in Crivelli's day; it is clearly retrospective, for sackbut in a monochord stage are not uncommon in works of art of the same century. In a MS. preserved in the library of the Arsenal in Paris, executed for the dukes of Burgundy in the middle of the 15th century, is seen a trumpet of

---

2 This question has been thoroughly investigated by the late Professor George Case in his work on the trombone.

6 Illustration in Du Sommerard, *op. cit.*, album, 4° série, pl. xvii.

---

The cavalry type with a single straight slide drawn out so far that the bell rests on the performer's foot (fig. 3).

The last transition immediately preceding the change into the trombone consisted in folding the tube to form two **U**-shaped ones of pointed downwards and the other over the shoulder, reaching to the base of the head; the third branch was bent over between the other two, and in a plane almost at right angles above them, the bell extending downwards beyond the body. The sackbutts of this type are to be seen in Dürrer's picture in the Nuremberg Psalterium in Piazza S. Marco among the band to the right of the picture.

For further history and development of the sackbut are given under TROMBONE. See also TRUMPET and BUCINNA.

(K. S.)

SACKETT'S HARBOR, a village in Jefferson county, New York, U.S.A., at the eastern end of Lake Ontario, on the south shore of Black River Bay, about 1 m. from its mouth, and about 10 m. W. by S. of Watertown. Pop. (1890) 787; (1900) 1266; (1905) 903; (1910) 868. Sackett's Harbor is served by the New York Central & Hudson River railway. It is built on low land, around a small, nearly enclosed harbour, the northern shore of which is formed by Navy Point, a narrow tongue of land extending about 4 m. nearly due eastward from the mainland. About 1 m. the W., Two Holes (Horse Island, approximately 500 feet long and wide) is a group of rocks, only a few feet above the lake level and separated from the mainland by a narrow strait, always fordable, and sometimes almost dry; at its eastern end is Sackett's Harbor Lighthouse. The harbour is deep enough for the largest lake vessels. The village is a summer resort. At Sackett's Harbor are Madison Barracks, a United States military post, established in 1813 and including a reservation of 99 acres; and a United States Naval Station. In the post cemetery is the grave of General Zebulon M. Pike, who was killed at York (now Toronto) on 27 April 1813.

The first settlement was made in 1801 by Augustus Sackett, and the village was incorporated in 1821. In the War of 1812 Sackett's Harbor was an important strategic point for the Americans, who had here a naval station, Fort Tompkins, at the base of Navy Point, and Fort Volunteer, on the eastern side of the Narrows town, and in July 1812 a British squadron unsuccessfully attempted to capture a brig and schooner in the harbour. From Sackett's Harbor American expeditions against York (now Toronto) and Fort George respectively set out in April and May 1813; though scantily garrisoned it was successfully defended by General Jacob Brown (who had just taken command) against an attack, on the 20th of May, of Sir George Prevost with a squadron under Sir James Lucas Yeo. The British losses were 259; the American 157, including Lieut.-Colonel Electus Backus, commander of the garrison before General Brown's arrival. Almost all the American stores at the naval station were destroyed to save them from the enemy. The blockade of the harbour by Yeo was abandoned in June 1814 after the defeat of a force from the squadron sent out to capture guns which were being brought from Oswego to Sackett's Harbor to equip the “Superior,” an American vessel launched on the 1st of May, and a smaller vessel nearly completed. Sackett's Harbor was the starting-point of a force of 700 men under a Pole named von Schultz, who in November 1814, during the uprising in Upper Canada (Ontario) attempted to invade Canada, was taken prisoner near Prescott, was tried at Kingston, being defended by Sir John Macdonald, and with nine of his followers was executed in Kingston in December.
SACKING AND SACK MANUFACTURE—SACKVILLE

SACKING AND SACK MANUFACTURE. Sacking is a heavy closely-woven fabric, originally made of flax, but now almost exclusively made of jute or of hemp. The more expensive kinds, such as are used for coal sacks for government and other vessels, are made of hemp, but the jute fibre is extensively used for the same purpose, and almost entirely for coal sacks for local house supplies. The same type of fabric is used for wool sacks, cement bags, ore bags, pea sacks and for any heavy substance; it is also made up into a special form of bag for packing cope and rolls of jute and flax yarns for delivery from spinners to manufacturers. Proper sacking is essentially a twilled fabric, in which the number of warp threads greatly exceeds the number per inch of weft. The illustration shows a typical kind of three-leaf twill, double warp sacking.

All three-leaf twill sacking are double in the warp, but four-leaf sacking are single. They are usually 27 in. wide, but other widths are made.

The lower part of the illustration shows four repeats of the three-leaf twill, while the lines drawn to the plan of the fabric show that each line of the design is reproduced in the cloth by two warp threads. The weft is single, but each one is usually about four times the weight of the warp for the same length. The lengths of cloth are then separately doubled up, the sides sewn by special sewing machines of the Laiing or Union make (of which there are seven or eight different kinds for different types of bags), and the ends hemmed. It will thus be seen that the length required is twice the length of the sack plus the amount for hemming the mouth.

The sack is now ready for delivery, unless the name of the owner, some trade mark, or other particulars are required to appear on it. These particulars are printed on in one or more colours by the Kinmond and Kidd patent multicolour sack-printing machine.

The chief centres for these goods are Dundee and Calcutta, all varieties of sacks and bags being made in and around the former city.

SACKVILLE, GEORGE, 1ST VISCOUNT (1716-1789), generally remembered as Lord George Sackville or Lord George Germain, third son of Lionel Cranfield Sackville, 1st duke of Dorset, was born on the 26th of January 1716. Educated at Westminster School and Trinity College, Dublin, he was gazetted captain in the 7th Cathcart's Horse (now 6th Dragoon Guards) in 1737, and three years later was transferred to Bragg's regiment of foot (Gloucestershire Regiment) as lieutenant-colonel; immediately afterwards the regiment sailed for active service on the Rhine, and although it was not present at the battle of Dettingen, its lieutenant-colonel was made brevet colonel and aide-de-camp to the king. It was not until two years later that Sackville took part in his first battle, Fontenoy. Wounded in the charge of Cumberland's infantry column, he was taken to the tent of King Louis XV. to have his wound dressed. Released, by what means does not appear, he was sent home to serve against the Pretender in Scotland. He was given the colonelcy of the 20th (Lancashire Fusiliers), but was too late to take part in the battle of Culloden. In 1740, he was again with the Duke of Cumberland in the Low Countries, and in 1749 was transferred to the cavalry, receiving the colonelcy of the 7th (3rd) Irish Horse (Carabiniers).

With this office he combined those of first secretary to his father, the lord-lieutenant of Ireland, and Irish secretary of war, and a seat in each of the two Houses of Commons at Westminster and Dublin, winning at the same time the repute of being "the gayest man in Ireland except his father." In 1755 he was promoted major-general, took an English command, and vacated his Irish offices. In 1757 he was made lieutenant-general of the ordnance, and transferred to a fourth colonelcy. In 1758, under the duke of Marlborough, he shared in the ineffective raid on Caenca Bay, and the troops, after a short sojourn in the Isle of Wight, were sent to join the allied army of Duke Ferdinand of Brunswick in Germany. Marlborough died shortly after they landed, and Sackville succeeded him as commander-in-chief of the British contingent. But no sooner had he taken over the command than his haughty and domineering temper estranged him from his second-in-command, Lord Boly. In 1759 he was forced to be commander-in-chief, Prince Ferdinand. This culminated on the day of Minden (August 1, 1758). The British infantry, aided by some of the Hanoverians, had won a brilliant success, and every man in the army looked to the British cavalry to charge and to make it a decisive victory. But Sackville, in spite of repeated orders from Prince Ferdinand, sullenly refused to allow Granby's squadrons to advance. The crisis passed, and the victory remained an indecisive success. Popular indignation was unabated, and Sackville was dismissed from his offices. But his course, though impugned, was sufficient to make him press for a court-martial, and a court at last assembled in 1760. This pronounced him guilty of disobedience, and adjudged him " unfit to serve his Majesty in any military capacity whatsoever." The sentence was executed with gratuitous harshness. It was read out on parade to every regiment in the service, with a homily attached, and placed on record in every regimental order book. Further, it was announced in the Gazette that his Majesty had expelled Sackville from the list of the Privy Council. This, and Sackville's own dogged perseverance, turned the scale in his favour. No reverses to the British arms occurred to keep alive the memory of his lost opportunity, and in 1763 his name was restored to the list of the Privy Council. Hitherto without party ties in parliament, in 1769 he allied himself with Lord North. To this period belong the famous Junius Letters, with the authorship of which Sackville was erroneously credited. In 1770, under the terms of a will, he assumed the name of Germain. In the same year his coolness and courage in a duel with Captain George Johnstone, M.P., assisted to rehabilitate him, and in 1775, having meantime taken an active part in politics, he became secretary of state for the colonies in the North cabinet. Thus, though still standing condemned as unfit for any military employment, he exercised a powerful and unfortunate influence on the military affairs of the nation. Some of the business of the war department in those days fell to the colonial office, and Germain was practically the director of the war for the suppression of the revolt in the American colonies. What hopes of success there were, though, was a far cry from what the North cabinet could have dreamt of, by their misunderstanding of the situation and their friction with the generals and the army in the theatre of war. But this failure was not on the same footing as that of Minden, and in spite of virulent party attacks, King George III., on the resignation of the North ministry, offered him a peerage. Sackville, in characteristic fashion, stipulated for a viscountcy, as otherwise he would be junior to his secretary, his lawyer and to Amherst, who had been page to his father. There was some opposition to his taking his seat in the House of Lords. But his health was failing and he withdrew from politics, spending his last years as a benevolent and autocratic country magistrate. He died at...
Stoneland Lodge (Buckhurst Park), Sussex, on the 26th of August 1785.

SACKVILLE, MORTIMER SACKVILLE-WEST, 1st BARON (1820-1888), was descended from Sir Richard Sackville, a Kentish gentleman, and a cousin of Ann Boleyn. A member of parliament and courtier under Henry VIII, Richard Sackville became chancellor of the court of augmentations in 1548 and was knighted in 1549. He amassed a great deal of wealth, and Sir Robert Naunton said his name should be "fill-sack," rather than "Sackville." He was on friendly terms with Roger Ascham, whom he advised to write his Scholemaster. In 1604 his son Thomas was created earl of Dorset, and from him the earls and dukes of Dorset (q.v.) of the Sackville family were descended.

Mortimer Sackville-West was a younger son of George John Sackville-West, 5th Earl de la Warr (See de la Warr): his mother, Elizabeth, Baroness Buckhurst, being a daughter of John Frederick Sackville, 3rd duke of Dorset. When in 1873 his elder brother, Reginald Windsor, became 7th Earl de la Warr, Mortimer succeeded by arrangement to the extensive estates of the Sackvilles, including Knole Park, their beautiful Kentish residence, which had come to his family through his mother. In 1876 he was created Baron Sackville of Knole, and died on the 1st of October 1888.

His brother, LIONEL SACKVILLE-WEST (1827-1908), succeeded as 2nd baron. He had a long career in the diplomatic service. From 1872 to 1878 he was ambassador to the Argentine Republic; from 1878 to 1881 he represented his country at Madrid, and from 1881 to 1888 at Washington. His retirement was due to an unfortunate interference in American domestic politics, or what was taken as such, which caused some stir. He died in September 1908 and was succeeded by his nephew Lionel Edward (b. 1867) as 3rd baron. By a Spanish dancer, Josefa Duran de Ortega, known also as Pepita de Oliva, Mr Sackville-West, as the 2nd baron then was, had several children, and soon after his death one of these, calling himself Ernest Henri Jean Baptiste Sackville-West, claimed to be a lawful son and his father's heir. He asserted that between 1863 and 1867 Sackville-West had married his mother. The case came before the English courts of law in 1909-1910, and it was decided that the children of this union were all illegitimate, as Pepita's husband, Jean Antonio Gabriel de Oliva, was alive during the whole period of his wife's connexion with Sackville-West.

SACO, a city of York county, Maine, U.S.A., on the Saco river, and the Atlantic Ocean, opposite Biddeford, with which it is connected by bridges, and 14 m. S.W. of Portland. Pop. (1890), 6075; (1900) 6122 (903 foreign-born); (1910) 6983. It is served by the Boston & Maine railway, and is connected with Portland by an electric line. The actual municipal limits include an area of about 40 sq. m., but much of this is sparsely settled, and the centre of population, or city proper, is about 5 m. above the mouth of the Saco. The city has a public park (Pepperell Park) of 190 acres, the Dyer Library (1799), containing in 1868 16,000 volumes, and York Institute (established in 1866 and incorporated in 1867), with a library of 5000 volumes in 1908; and is the seat of Thornton Academy (co-educational), incorporated in 1811, opened in 1813, but closed during 1848-1856 after the burning of the old building. Old Orchard Beach, in the vicinity, extending along the shore front of the township of Old Orchard (pop. in 1900, 964) and part of the shore fronts of Saco and Scarborough, is a popular summer resort; in August 1907 nearly all the hotels were burnt, but others have since been built. At Saco the river falls about 55 ft. and provides excellent water-power. The city's principal manufactures are cotton goods and cotton-mill machinery. Saco was settled as early as 1631, and was the seat of the Gorges government from 1636 to 1653, when it passed under the jurisdiction of Massachusetts. Until 1762 Saco and Biddeford formed one town or plantation—until 1774 the name of Saco, and from 1778 to 1782 under the name of Biddeford. In 1776 Sir William Pepperrell acquired title to the principal part of what is now Saco, in 1752 this was made a separate parish, and ten years later it was incorporated as a separate township under the name of Pepperellboro. In 1779 the Pepperrell property was confiscated as that of a loyalist, and in 1805 the name of the township was changed to Saco. In 1867 Saco was chartered as a city.

SACRAMENT, in religion, a property or rite defined in the Anglican catechism as "an outward and visible sign of an inward and spiritual grace"; if the grace be allowed to be inherent in the external symbolic thing or act as well as in the faithful who receive or do it, this definition holds good not only for the Latin Church, but for more primitive religions as well. In the Greek Church the equivalent word is ἱπποτρύφα, a mystery, a usage which is explained below.

The Latin word sacramentum originally meant any bodily or sensible thing, or an action, or a form of words solemnly endowed with a meaning and purpose which in itself it has not. Thus the money deposited by each of two litigants in a sacred precinct or with a priest, was called a sacrament. The winner of the suit got back his deposit, but the loser forfeited his to the god or to the winning party. In Livy it signifies the oath (q.v.) which soldiers took among themselves not to run away or desert.

Pliny uses it similarly of the oath by which the Christians of Bithynia bound themselves at their solemn meetings not to commit any act of wickedness. Tertullian (c. 160-230) uses it in both senses, of an oath, as in the passage of his treatise About Spectacles, where he says that no Christian "passes over to the enemy's camp without throwing away his arms, without abandoning the standards and sacraments of his chief." In the treatise To the Nations, i. 16, he speaks of "the sacraments of our religion," intending, it would appear, the love-feast and Eucharist. So in the Apocalypse, ch. vii., he speaks of "the sacrament of infanticide and of the eating of a murdered child and of incest following the banquet," the crimes of which the Christians were commonly accused. In the work Against Marcion, iv. 34, he speaks of the sacrament of baptism and Eucharist. In the work against the Jews, ch. xi., he speaks of the letter "to set in ink on the foreheads of the men of Jerusalem (Ezek. iv. 4), as 'the sacrament of the sign,' i.e. of the cross; and in chap. xiii. of the same work he dwells on the sacrament of the wood prefurred in 2 Kings vi. 6. The stick with which Elisha made the iron to swim in that passage, and the wood which Isaac carried up the mountain for his own pyre were sacraments reserved for fulfilment in the time of Christ." In other words they were types, things which had a prophetic significance. In the same work, chap. x., he speaks of "the sacrament of the Passion foreshadowed in prophecies." In his work On the Soul, chap. xviii., the aeons and genealogies of the Gnostics are "the sacraments of heretical ideas." In the work About the Crown, chap. iii., he describes how the faithful "take the sacrament of the Eucharist also in their meetings held before dawn." Elsewhere he speaks of "the sacraments of water, oil, bread." In the work Against Valentinians, chap. xxxix., he speaks of the "great sacrament of the body of Christ," here rendering the Greek word σώματος, mystery. In the tract On Monogamy, chap. xii., he speaks of the "sacrament of monogamy." Elsewhere he talks of the "sacrament of faith," and "of the Resurrection," and "of human salvation," and "of the Pascha," and "of union," and "of the body of Christ." Later Latin fathers use the word with similar vagueness, e.g. Augustine speaks of the salt administered to catechumens before baptism and of their exorcism as sacraments; and as late as 1129 Godfrey so calls the rite of washing feet a sacrament, because without it we have no portion with Christ (John xiiii. 8), and therefore it is necessary to salvation. Hugo de St Victor, c. 1120, in his work On the
Sacraments, distinguishes six, but of different grades of importance. The two principal ones necessary to salvation are baptism and the Eucharist; then come the water of baptism and the wearing of cinders, and so forth; these advance a man in sanctity. Lastly come those needful to the hallowing and instituting of other sacraments, those which concern the conferring of orders or of monkish habit. In his Summa he declares that as there are seven chief sins, either original or of act, so must there be seven sacraments to remedy them; but he only enumerates six, namely baptism and the sacraments of confirmation, of the altar, of penance, last unction and matrimony. Peter Lombard (c. 1150) added as a seventh that of ordination, and to this number the Latin Church adhered at the councils of Florence and Trent. This enumeration was also adopted in 1575 as against the Augustan confession of the year 1540 by Jeremiah Patriarch of Constantinople, and again in a council held in the same city in 1639 to anathematize Cyril Lucar, who with the Anglicans recognized two only, baptism and the Eucharist. It is hardly fair on the strength of these two pronouncements to attribute the doctrine of seven sacraments to the Eastern churches in general; except under a sporadic Latin influence, they have not troubled themselves so to define their number.

In his article it is impossible to attempt a history of the sacraments and of the controversies which in every age have arisen about them. It is enough to formulate a few general considerations of a kind to orientate and guide inquirers. To begin with, it is obvious that the number of sacraments must vary according to the criteria we use of what constitutes a sacrament. The Anglicans recognize baptism and the Eucharist alone, under the impression that Christ ordained these and none other. The Latin doctors by arguments as good as those usually put forth in such controversies have no difficulty in proving that Christ instituted all seven. How, they argue, could Paul (1 Cor. iv. 1) call himself and others “ministers of Christ and stewards of the mysteries of God” unless the mysteries in question had been directly instituted by Christ? They contend even that extreme unction was so instituted, and that St James in his Epistle did but promulgate it. So Christ instituted confirmation non exhibendo sed promittendo, not by undergoing it and so setting it forth in His own person, but by promising to send the Paraclete. The sacrament of confession and penance He equally instituted when He assigned the power of the keys to the Apostles.

The Latin Church, following Gulielmus Antissiodorensis (c. 1235), distinguishes in each sacrament the matter from the form. The matter is the sensible thing which in accordance with Christ’s institution can be raised to a sacramental plane. It is, e.g., water with immersion in the case of baptism; bread and wine in the Eucharist; anointing and laying on of hands in confirmation; contrition in the sacrament of penance. The form consists of the words used in the rite, e.g., in penance, of the formula “I absolve thee”; in the Eucharist, of the words “This is my body” and “This is the cup of my blood”, or “This is my blood”; in confirmation, of the words “I sign thee with the sign of the cross and confirm thee with chrism of salvation in name of Father and Son and Holy Spirit”; in baptism, of the words “I baptize thee in the name of Father, Son and Holy Spirit (or among the Greeks “N. or M. is baptized in the name,” etc.). Merely verbal change in these formulae made without prejudice to the sense does not invalidate the sacrament. On the part of the minister or priest officiating, must be present an inward intention or will to do what the Church does. Thus a drunkard’s or a madman’s sacraments would only be mockery, even though the recipients received them in good faith and devoutly. On the other hand, sanctity of life on the part of the minister is not necessary in order to the validity of the sacraments which he confers, although this was held to be the case by the Donatists in the 4th century, and following them by the Waldensians and Albigeness in the 12th, and by the followers of Hus and Wycliffe in the 14th. The latter enunciated the following rule: “If a bishop or priest be living in mortal sin, then he neither ordains, nor consecrates, nor baptizes.” The Cathars even held it necessary, in case a bishop fell into mortal sin, to repeat his baptisms and ordinations, for they had been vitiated by his sins. On such points the Catholics followed the more sensible course.

Certain of the sacraments can obviously only be once conferred, e.g., baptism, confirmation and orders; but can be conditionally repeated, if there is a doubt of their having been verified. In conditional baptism the Latins, since about the year 1227, use the formula, “If thou art not baptized, then do I baptize thee,” etc. The Latins further insist on a strict observance of the traditional matter and form. Thus baptism is not valid if wine or ice be used instead of water, nor the Eucharist if water be consecrated in place of wine, nor confirmation unless the chrism has been blessed by a bishop; also olive oil must be used. The distinction, be it noted, of form and matter seems more appropriate to the sacraments of baptism, Eucharist, confirmation and last unction, than to those of orders, penance and matrimony. The recognition by the Church of the last-named as a sacrament, was, in spite of the commendation uttered by Jesus (Mark x. 9), slow and arduous, owing to the extricately enthusiasms of the first generations of believers. In many regions baptism involved renunciation of married life, and for at least two hundred years marriage was a civil right preceding baptism, which was deferred until the age of thirty or even later. Liturgical forms for consecrating marriage are of late development, and the Church took the institution under its protection through outside social pressure rather than of its own will and wish.

In any Latin pontifical or Greek eulogium we find numerous prayers for the consecration, not only of men, but of things. Here is an example of such a petition from the 9th century code Book of Heribert, archbishop of Milan: “Be thou graciously pleased by the infusion of the Holy Spirit to strengthen and enhance the substance, of old approved by thee, of this oil here before thee; to the end that whatsoever in the human kind hath been touched therewith may speedily pass to a higher nature, and that the ancient Enemy may not, after anointing with the same, claim aught for himself, but that he may grieve for that he is exposed to the shafts of this blessed engine of defence, and groan because by the oil of peace the swellings of his antique fury are kept down and repressed: through our Lord Jesus Christ, etc.

Let us again enunciate the following prayer for baptism over the water from the Ethiopic Statutes of the Apostles as translated by the Rev. F. Horner (London, 1904, p. 165): “God, by Lord Almighty, who madest heaven and earth . . . who mingledst and untest the immortal with the mortal, who madest living man a combination of the two, and gavest to that which was made body a soul also, which thou causest to dwell within: stir this water and fill it up with thy Holy Spirit, that it may become water and Spirit for regeneration to those who are to be baptized: work a holy work and make them to become sons and daughters of thy holy name.”

Such petitions as the above are common in the more ancient of the Christian cults, and are all alike inspired by the idea that a spirit or divine virtue can be confined in material objects which are to be brought into contact with or swallowed by men and animals. The same idea pervades old medical treatises; for a drug was not a chemical substance taking effect naturally on the human system, but something into which a supernatural virtue had been magically introduced, in order the more easily and efficaciously to be brought to bear upon the patient. The spirits which take possession of man or animal can equally take possession of a material substance, and even replace the substance, leaving the outward accidents of colour, shape and size unchanged. This primitive belief, termed “animism” by E. B. Tylor, asserts itself everywhere in Christianity; and objects thus invested with spiritual or curative powers are called by the Latin doctors sacramentals. Thus in the Theologia dogmatica

Sacrament of certain Paris, in argues if caused use the virtue wine, miracles first many martyrs It true laying demiurge as mere religion that largely and mere sacramentals the effect. That sacramentals has older answer the nations was earlier the sacrament of the Eucharist was largely modelled, even though it may not have been in any way a continuation of the same. Baptism and the agapē took their rise in Palestine, and in their origin were little different from the influence of the Eucharist. There can be found Jewish models if necessary, the sacred feasts of the Essenes and Therapeuta in particular, as described by Josephus and Philo, closely resembled the Eucharistic agapē.

Undeniably Clement of Alexandria and Origen apply the language of the Greek mysteries to Christian gnōsis and life. “These are,” says Clement, “divine mysteries, hidden from most and revealed to the few who can receive them.” And Origen compares them to the sacred vessels, and would have them guarded secretly behind the veil of the conscience and not lightly produced before the public. He who so produces them “dances out the word of the true philosophy,” a technical description of the profanation of the mysteries. It is not even safe, according to these two fathers, to commit too much to writing; and Clement undertakes not to reveal in writing many secrets known to the initiated among his readers; otherwise the indiscreet eye of the heathen may rest on them, and he will have cast his pearls before swine. But we may discount most of the Greek mysteries, or bizarre pedantry, copied as a rule from Philo of Alexandria, with caution from the latter’s description of the Therapeuta (ed. Mangey, ii. 475) we read how each ascetic had “in his house a room in which in solitude they celebrated the mysteries of the holy life, introducing nothing therein, either to drink or to eat, nor anything else necessary for the uses of the flesh.” And in scores of other passages Philo dwells on “the ineffable mysteries” of Jewish faith and allegory. He even writes thus: “O ye initiated ones, with purified sense of hearing, shall ye accept in your souls these truly sacred mysteries, nor divulge them to any of the uninitiated . . . I have been initiated by Moses the friend of God in the great mysteries.” But because he uses the language of the Greek mysteries, Philo never imitated the thing itself; and he is ever ready to denounce it in the bitterest terms. Clement and Origen really meant no more than he. At a later period, however, the difficulty of screening the rites of baptism and Eucharist from the eyes of catechumens and from their ears the creeds and liturgies—a difficulty which had ever been insurmountable and which after the overthrow of paganism must have become insurmountable—have led to not only a great outpouring on the part of the Christian rhetors, like Basil, Chrysostom, the Gregorys and the Cyril, of phrases borrowed from the Greek mysteries, but perhaps an actual use of precautions. Thus the bishop of Rome, Julius (c. 340), complained (Athanasius, Apol. cont. Ariam, 31, Migne 25, 300) that a court of law had not been cleared of catechumens, Jews and pagans, in a case where the legal discussion introduced the topic of the table of Christ; and the preachers of the 4th and

1 Perhaps, however, Pliny refers only to the renegades among them.
Sacramentals—Sacramento

979

In the age of the Council of Nice the custom arose of baptisming children of three, because at that age they can already talk and utter the baptismal vows and responses. Not a few homilies of that age survive, denouncing the deferring of baptism, and urging on parents the duty of initiating their young children. The power and efficacy of the presence of the Lord, to show that long before the 300-child baptism was in vogue. But in that case how can the creed and ritual of baptism, the Lord's Prayer and the Eucharistic formulae, have been kept secret? How can they have been the "awful mysteries," the "dread and terrible canons," the "incestuous teachings," the "oracles" too sacred to be committed to writing? which the homilists of that age pretend that they have been? Could our modern freemasons continue to hide their watchwords and ritual, or even make a pretence of doing so, if they were constrained by public opinion to initiate every child three years of age? The thing is absurd. When, therefore, we find such phrases in Greek and Latin homilies of the period of 350 to 550 we must regard them as elaborate make-believe. Because catechumens as well as the faithful were present at the sermons, the preachers thought it becoming to throw them in; but the audience must have been aware that their secrets were open ones.

LITERATURE.—Theologia dogmatica et moralis ad mentem S. Thomae Aquinatis et S. Alphonsi de Liguero (6 vols., Paris, 1899); Gustav Anrich, Das antike Mysterienwesen (Gottingen, 1894); L. Duchene, Origines du culte christien (Paris, 1869); Joseph Bingham, Origins of Christianity (London, 1834); Adolf Harnack, Geschichte (Freiburg, 1897).

Sacramentals (Sacramentia), in the Roman Catholic Church certain acts or ordinances instituted not by Christ, but by the Catholic Church with divine authority. They are believed, in their application to persons and things, to communicate quasi ex opere operato through ordained priests the grace of God, consisting in purification, supernatural renovation and sanctification. The term is thus used to cover the rites of dedication, consecration and benefaction, and, closely connected with the last-named, exorcism.

Sacramentarians, the name given to those who during the Reformation controversies not only denied the Roman Catholic "transubstantiation," but also the Lutheran "con-substantiation." They comprised two parties: (1) the followers of Capito, Carlstadt and Bucer, who at the diet of Augsburg presented the Confessio Tetraginta from Strasburg; Constance, Lindau and Memmingen; (2) the followers of the Swiss reformer Zwingli, who to the same diet presented his private confession of faith. The doctrinal standpoint was the same—an admission of a spiritual presence of Christ which the devout soul can receive and enjoy, but a total rejection of any physical or corporeal presence. After holding their own view for some years the four cities accepted the Confession of Augsburg, and were merged in the general body of Lutherans; but Zwingli's position was incorporated in the Helvetic Confession. It is a curious inversion of terms that in recent years has led to the name Sacramentarians being applied to those who hold a high or extreme view of the efficacy of the sacraments.

Sacramento, the capital of California, U.S.A., and the county-seat of Sacramento county, 91 m. (by rail) N.E. of San Francisco, on the eastern bank of the Sacramento river, about 61 m. above its mouth, at the point where it is joined by the American. Pop. (1850) 6820, (1855) 26,386, (1900) 29,282, of whom 6723 were foreign-born (1371 Germans, 1293 Irish, 964 Chinese, 655 English, 446 English Canadian and 337 Japanese) and 402 were negroes, (1910, census) 44,666. Land area (1906) 449 sq. m. Sacramento is on the direct eastward line to Ogden, Utah, of the Southern (once the Central) Pacific railway (which has its main shops here), the starting point of the Southern Pacific line to Portland, Oregon, the terminus of several shorter branches of the Southern Pacific and on the Western Pacific, which has repair shops here, and it is served by interurban electric railways connecting with places in the Sacramento and San Joaquin valleys. The city is about 200 m. below Red Bluff, the head of river navigation for boats drawing 2 or 3 ft. of water; for boats drawing 4 to 5 ft. Colusa, 91 m. above Sacramento, is the head of navigation; at low water, vessels drawing 7 ft. of water go up the river to Sacramento. There are two daily steamers lines to San Francisco, besides freight lines.

Sacramento is on a level (formerly in many parts 5 ft. below flood-level of the river) and is about 30 ft. above sea-level, and the street plan is rectangular. The business quarter has been filled in, and levees have been built along the Sacramento and American rivers. The climate is mild: the average annual temperature is 60-5° F.; average for winter months, 48-5°; for spring, 59-9°; for summer, 71-7°; for autumn, 61-5°; average rainfall, 19-94 in.; average number of clear days per annum, 244. The principal buildings are: a very fine state capitol (cornerstone laid, 1860; completed, 1874) in a wooded park of 35 acres, in which is an Insectary where parasites of injurious insects are propagated; Roman Catholic and Protestant Episcopal cathedrals; the county court-house; the city hall; the public library (in 1908, 41,400 volumes); and the Crocker Art Gallery, which was presented to the city by the widow of Judge E. B. Crocker, one of the founders of the Central Pacific, with an art school and an exhibit of the minerals of the state. There is a state library of 140,000 volumes in the capitol; connected with it are travelling libraries sent out through the rural districts of the state. In Sacramento are the large state printing establishment, in which, in addition to other books and documents, text-books for the entire state school system are printed; the College of the Christian Brothers, How's Academy, Atkinson's Business College, St Joseph's Academy, the Stanford-Lathrop Memorial Home for Friendless Girls (1900), under the Sisters of Mercy, two other orphanages, the Southern Pacific Railway Hospital (1868), the Mater Misericordiae Hospital (1855), Sisters of Mercy, Wentworth Hospital, a City Receiving Hospital (1884), the Marguerite Home (for old ladies), the Mater Misericordiae Home (1895), Sisters of Mercy) and the Peniel Rescue Home (1899). Just outside the city limits is the State Agricultural Pavilion, with race track and live-stock exhibition grounds (where the State Agricultural Society holds its annual "State Exposition" in September).

The city has a large wholesale trade. Its prosperity rests upon that of the splendid Sacramento Valley, a country of grain and fruit farms, along whose eastern side lie the gold-producing counties of Butte and Sierra, and the centre of the greatest deciduous fruit region of California, and shipped about 71,000 car-loads eastwards of the Rocky Mountains in 1909. Sacramento derives electric power from Folsom, on the American river, 22 m. away, and from Colgate, on the Yuba river, 119 m. distant. The manufacturing interests of the city are large and varied: the city's manufactures include flour (1905, value $1,172,747), lumber, distilled liquors, canned and preserved vegetables and fruits, packed meats, cigars and harness. In 1905 the total value of the factory product was $10,319,416. In 1900 the assessed valuation of the city was about $30,400,000, and the bonded indebtedness about $1,100,000. The city owns its own water system, which has a capacity of 22 million gallons daily, and is a financial success.
officer, was allowed to erect a fort on the then frontier of California, on the present site of Sacramento. He became a Mexican official (1849), and in 1847 obtained from the Mexican government a grant of 11 square leagues of land. Sutter's fort, or "New Helvetia," (a reproduction of which, with a historical museum, in Fort Sutter Park, is open to the objects of interest in the city), was the direct line of the later immigration from the East, and at its position—purposely selected by Sutter with a view to freedom of interference from Mexican officials—made Sutter a man of great importance in the last years of the Mexican regime. After the discovery of gold in 1848, made on Sutter's land, near the present Coloma, about 45 m. E.N.E. of Sacramento, several rival towns were started on Sutter's property near the fort. Of these fortune finally favoured Sacramento—a name already frequently applied to the fort, and adopted for the name of the settlement about its embarcadero or river landing in 1848. The first sale of town lots was in January 1849. Here began the determined movement for the organization of a state government. The extraordinary richness of the placer mines of '49 caused the city to grow with wonderful rapidity. In October 1849 its population was probably 2000, in December 4000 and a year later 10,000. Trouble with land "squatters" almost led to local war in 1850. In 1849 the city offered $1,000,000 for the honour of being the state capital, which it finally secured in February 1854 (the actual nature having already met the cartel at San Francisco in 1851). Between November 1849 and January 1853 the city was thrice devastated by fearful floods, and it was two-thirds destroyed by fire in November 1852; but though these misfortunes caused a collapse of inflated realty values they did not seriously cripple the city in its development. A city government was organized in August 1849, and in February 1850 this government was incorporated, and in 1863 reincorporated; the city and county governments were consolidated from 1858 to 1863; and a new city charter was received in 1863, coming into effect in 1864. The first local steam railway of California was opened from Sacramento in 1855, and here in 1863 was begun the building of the Central Pacific railway across the Sierras, the first train from the Atlantic coast reaching Sacramento in May 1869. In 1862 there was another flood, the most destructive in the history of the city; since then the measures taken for protection have secured safety from the river. The government of the city and its charities was exceedingly corrupt and expensive. Progress since the end of the flush mining days has been steady and conservative.

SACRARIUM, the term in classic architecture given to the cella of a temple, and to the apartment in a dwelling-house which was sacred to a deity. In medieval architecture the term is applied on the European continent to that portion of a chancel, which, enclosed with a railing or balustrade in front of the altar, is devoted to the celebration of the Holy Eucharist; this in England is generally known as the presbytery.

SACRED HEART. Devotion to the Sacred Heart of Jesus is a cult peculiar to the modern Roman Catholic Church. The principal object of this devotion is the Saviour Himself. The secondary and partial object is that Heart which was the seat or organ of His love, and which forms the natural symbol thereof. Heart and love are viewed, not physiologically, but in their moral connexion. The chief liturgical expressions of this cult are the institution of a feast of the Sacred Heart and public representations of it by statues and pictures.

Private worship of Christ's heart in particular is of great antiquity in the Church, and is prominent in St Gertrude and other mystics. It was greatly stimulated in the 17th century by St Francis of Sales (q.v.) who gave this symbol to his Order (the Visitation) as its badge. The Venerable Fr. Eudes must also be mentioned as a great propagator of the devotion, in the same century, and he was the first to obtain a certain public, though only local, authorization of the new pious practices. Blessed Margaret Mary Alacoque (1647-1690), a Visitatión nun of Paray-le-Monial, assisted by her director, the Venerable Claude de la Colombière, S.J. (1641-1682), was the instrument of the introduction of the specific worship of the Sacred Heart into the Church by a decision of the supreme authority, although their work only took effect long after their death. Mary of Modena, the exiled queen of James II., at the instance of the Visitation, petitioned in 1697 for a proper Feast of the Sacred Heart. Neither then, however, nor on the presentation of new petitions in 1749, was an affirmative answer obtained. Meanwhile the chief objection, that of "novelty," was gradually removed by the multiplication of local manifestations, the genuineness of which was proved to the satisfaction of the Roman Congregation of Rights, and in 1765 it was allowed for houses of the Visitation and certain countries. It must be added that this devotion was strongly opposed, not only by the Jansenists, but by others within the Church, under the mistaken idea that the Heart of Christ was viewed in it as separate from the rest of His Being. The formulation of this objection by the synod of Pistoia, in 1786, however, only provoked a clearer explanation of the doctrine, which contributed to confirm the cult. In 1856 Pius IX. introduced the feast into the general calendar of the Roman Catholic Church, fixing the Friday after the Octave of Corpus Christi for its celebration. The Beatification of Blessed M.M. Alacoque in 1864 gave a new impetus to the cause of which she had been the apostle.

SACRIFICE (from Lat. sacrificium; sacer, holy, and facere, to make), the ritual destruction of an object, or, more commonly, the slaughter of a victim by effusion of blood, suffocation, fire or other means. While the Hebrew for sacrifice, zab, makes the killing of the victim the central feature of the ceremony, the Latin word brings out the fact that an act of sacralization (see Taboo) is an essential element in many cases. The sacrifice of desacralization is, however, also found; hence MM. Hubert and Mauss describe a sacrifice as "a religious act, which, by the consecration of a victim, modifies the moral state of the sacrificer or of certain material objects which he has in view," i.e. it either confers sanctity or removes it and its analogue, impurity. It is, in fact, "a procedure whereby communication is established between the sacred and profane spheres by a victim, that is to say by an object destroyed in the course of the ceremony." By this destruction term sacrifice is intended to cover the inanimate offering which is consumed by fire, broken or otherwise rendered useless for the purpose of human life.

Theories of Sacrifice. — Explanations of sacrifice, as of other rites, are naturally not wanting among the peoples who have practised or still practise it; but they are often of the nature of etiological myths and give no clue to the original meaning. Scientific theories date from the second half of the last century, and were originated in the first instance by the English anthropological school.

(a) According to the view put forward by Dr Tylor, the sacrifice is originally a gift, offered to supernatural beings by man for the purpose of securing their favour or minimizing their hostility. By a natural series of transitions the gift theory became transformed, in the minds of the sacrificers, into the homage theory, which again passed by an easy transition into the renunciation theory. These were, in fact, simply the popular theories of sacrifice, and put upon evidential basis by facts drawn from various stages of culture.

(b) With W. Robertson Smith, on the other hand, a new era was reached, in which the recently recognized existence of Totemism (q.v.) was made the basis of an attempt to give a
theory of origins. The first form of his theory distinguishes (i.)

honorable, (ii.) piacular and (iii.) mystical or sacramental sacrifices; but the latter type is traced back to the same cycle of ideas as that in which the piacular sacrifice originated. (i.) The essential

feature of this type was that the god and his worshippers shared

the sacrifice and might thus be regarded as commensals, or

table companions. The human commensals were the totem-kin,

whom Robertson Smith conceived to have been in the habit of

sharing a common meal in daily life, or at least of not mixing

with other kins. The object of sharing the meal with the god was

to renew the blood bond. The victim was the animal of a hostile
totem-kin or an animal commonly offered to the god. The god

was originally a stranger, taken into the kin by a rite of blood

brotherhood, and this constitutes the dark point of the theory;

for Robertson Smith regards the blood bond as relatively late;

hence we do not see how the god became associated with the

kin. (ii.) The piacular sacrifice arose from the need of atoning

for bloodshed within the kinship group; properly speaking,

the culprit himself should suffer: should he be unknown or

beyond the reach of vengeance, a substitute had to be found.

This was naturally found in the non-human member of the

totem-kin—the totem animal; in a sense, therefore, the god
died for his people. (iii.) In the mystical sacrifice the god is

himself slain and eaten by his worshippers. In the Ritual of

the establishment of the totemic order (pp. 84-94) the alliance

which was to overcome the difficulty pointed out above. The god,

the victim and the human group are regarded as of the same kin:

the animal (totem) is the earlier form of the god; the deity

was originally female, for under matrilineal rules the mother

alone is of kin to her children, but, with the rise of descent in the

male line, the god was transformed into a male. The sacrifice is in

its origin a communion; god and worshippers have a bond of

kinship between them; but it is liable to be interrupted or its

strength diminished. Ceremonies of initiation are the means

by which the alliance is established between the deity and

the young man, when the latter enters upon the rights of

manhood; and the supposed bond of kinship is thus regarded

as an artificial union from the outset, so far as the individual

is concerned, although Robertson Smith still maintains the theory

of the fatherhood of the god, where it is a question of the origin

of the totem-kin. From the communion sacrifice sprang the

piacular sacrifice, which here becomes a subsidiary form and finds its

full explanation in the ideas connected with the mystic union

of god and worshippers. For the object of the piacular is

the re-establishment of the bond of alliance, as precisely

that of the communion sacrifice. With the decline of totemic

sacrifice, the need for human sacrifice—the only means of re-establishing

the broken tie of kinship when the animal species was no

longer akin to man.

This theory of Robertson Smith’s has been attacked from two

sides. In the first place, L. Marillier (Rév. de l'Hist. des religions,

xxvi. 243) argues that if there was an original bond of kinship

between the god and the kin, there is no need to maintain it by

sacrificial rites, and cites against Smith’s view the practice of

totemic groups. To this it might be replied that the real

significance of initiation ceremonies is still obscure; it is a plausible

argument that the child does not form part of the kin till after

initiation, but this argument seems inconclusive, for in West

Australia there is solidarity, according to Grey (Journals, ii. 239),

between the whole of the kinship group, whether adult or not;

and, moreover, nowhere are rites found which are intended to

strengthen the union between a man and his totem by means of

the blood bond, unless we include the aberrant totemism of

the Arunta (Spencer and Gillen, Native Tribes of Central Australia,

167), who eat their totems in order to gain magical powers of

increasing the stock of the totem animal. Marillier further

argues that if, on the other hand, there was no bond between

god and people but that of the common meal, it does not appear

that the god is a totem god; there is no reason why the animal

should have been a totem; and in any case this idea of sacrifice

can hardly have been anything but a slow growth and conse-

quently not the origin of the practice. In the second place,

MM. Hubert and Mauss point out that Robertson Smith is far

from having established either the historical or the logical con-

nection between the common meal and the other types of sacrifice;

the simplest Semitic forms known to us are the most recently

recorded; further their simplicity may mean no more than

documentary insufficiency, and in any case does not imply any

priority; the piacular is found side by side with the communion

at all times. Moreover, under piacular are confused purifications,

propitiations and expiations; Smith’s contention that purifica-

tions, whose magical character he recognizes but interprets as

late, are not sacrificial, is far from conclusive.

(c) Building in part on the foundation laid by Robertson

Smith, Dr J. G. Frazer has put forward the view that while the

sacrifice of the god may have been piacular, it was also intended

to preserve his divine life against the inroads of old age. This

theory he exemplifies by two orders of cases, (i.) the putting

dead of the man-god, who is often also the king, on whose

wealth is held to depend the safety of his people, of the world,
or of the universe; and (ii.) the annual killing of the representa-

tive of the spirit of vegetation or of the Corn spirit (see DEEMONOLOGY).

(d) For L. Marillier sacrifice was, at its origin, essentially a

magical rite—the liberation by the effusion of a victim’s blood

of a magical force which was to bend the gods to the will of

man; from this arose, under the influence of cult of the dead,

the gift or piacular offering of sacrifice. For R. Smith, Marillier

also maintained, but without clearly explaining the relation of

this part of his theory to the preceding, that a human kinship group conceived the idea of allaying itself with one god in particular. This they did by sacrificing a victim and effecting communion with the god by the application of its blood to the altar; or, more directly, by the sacrifice of the animal god and the contact of the sacrificer with its blood.

(e) Dr Westermark takes the view that human sacrifice is as

a rule an act of substitution, in that men offer a victim in the

hope of saving themselves; but he also recognizes funeral

sacrifices of various kinds. Certain sacrifices of animals he

explains as intended to transfer a conditional curse.

(f) The preceding theories are attempts, in the main, to derive

from one source all the forms of sacrifice. MM. Hubert and

Mauss, while admitting that in all sacrifices is found some idea

of purchase or substitution, decline to admit that all have issued

from one primitive form. In their view, based on analysis of

Hebrew and Hindu forms of sacrifice, the unity of sacrifice

consists in the immediate aim of the ritual, not in the ultimate

attained; for we rarely find a rite other than complex and

by the same sacrifice more than one result may be sought

attained. The unity of procedure consists in the fact that every

sacrifice involves putting the divine in communication with the profane by an intermediary—the victim—which may be piacular or honorific, a messenger or a means of divination, a means of allying the eternal life of the species or a source of magical energy which the rite diffuses over objects in its neighbourhood.

(g) Our knowledge of primitive forms of sacrifice is meagre;

even were it more extensive, it would probably be impossible to
determine the origin or origins of sacrifice; for no ritual has

necessarily survived unchanged in form and meaning since its

inception, and even permanence of form cannot be taken to

imply a corresponding permanence of meaning for the worshippers.

If, however, we turn to Australia, where sacrifice is unknown,

we find more than one class of rites in which we can trace an idea akin to some forms of sacrifice. Just as the German

reaper leaves the last ears of corn as an offering to Wodan, so

the Australian black offers a portion of a meal of honey; in

New South Wales a pebble is said to have been offered or a

number of stones in Queensland the skin removed in forming

the body-scar. Thus it appears that the gift theory may after

all be primitive; the worship of, or care for, the dead may

have supplied in other areas the motive for the transition from

offering to sacrifice or the evolution may have been due to the

spiritualization of the gods. In Australia, among the Hottentots,
in the Malay Peninsula and elsewhere, blood ceremonies are in use which are unconnected with the slaughter of a victim; in this blood ritual we may see another possible source of sacrifice. The Arunta hold that the spirits of kangaroos are expelled by human blood from certain rocks. By parity of reasoning a blood ritual may have been adopted by peoples who practise the expulsion of evils, conceiving them either animistically or as powers; catharsis, in the sense of removal of uncleanness, is not necessarily primitive.

**Principles of Classification.** — It is possible to classify sacrifices according to (a) the occasion of the rite, (b) the end to be achieved, (c) the material object to be affected or (d) the form of the rite. (a) The division into periodical and occasional is important in Hindu and other higher religions, and the *sutas* constantly draw the distinction; the former class is obligatory, the latter facultative. In less developed creeds the difference tends to remain in the background; but where sacrifices are found, solemn annual rites, communal, purificatory or expiatory, are celebrated, and these are held to be in like manner obligatory. (b) The end to be achieved is, as has been shown by Hubert and Mauss, sometimes sacralization, sometimes desacralization. In the former case the sacrificer is raised to a higher level; he enters into closer communion with the gods. In the latter either some material object, not necessarily animate, is deprived of a portion of its sanctity and made fit for human use, or the sacrificer himself loses a portion of his sanctity or impurity. In the sacrifice of sacralization the sanctity passes from the victim to the object; in that of desacralization, from the object to the victim. (c) Sacrifices may be classified into (i) subjective or personal, where the sacrificer himself gains or loses sanctity or impurity; (ii) objective, where the current of *mana* (see *Taboo*) is directed upon some other person or object, and only a secondary effect is produced on the sacrificer himself. (d) The form of the rite may be (1) religious, i.e., the sacrificer undertakes the rite in observance of some religious duty, or (2) secular, i.e., the sacrifice is performed for some utilitarian purpose.

**Ritual.** — For Hinduism and later Judaism we possess a wealth of material on which to base a comparative study of the forms of sacrifice; a form of this—animal sacrifice in the Vedas—has been analysed by MM. Hubert and Mauss. For Greece and Rome, where the instructions as to ritual were not embodied in the elaborate codes handed down in Hinduism or Judaism, our material is far less complete. For other areas we have often no description of the procedure at all, but merely the briefest outline of the actual process of slaughter, and we are ignorant whether the form of the rite is in reality simple (either from a loss of primitive elements or from never having advanced beyond the stage at which we find it), or whether the absence of detail is due to the inattention or lack of interest of the observer. It must therefore be understood that the following analysis of ritual, based on the most elaborate codes known to us, is by no means conclusive as to the primitive form or forms of sacrifice. The necessary elements of a Hindu sacrifice are: (1) the sacrificer, who provides the victim, and is affected, directly or indirectly, by the sacrifice; he may or may not be identical with (2) the officiant, who performs the rite; we have further (3) the place, (4) the instruments of sacrifice and (5) the victim; where the sacrificer enjoys only the secondary results, the direct influence of the sacrifice is directed towards (6) the object; finally, we may distinguish (7) three moments of the rite—(a) the entry, (b) the slaughter, (c) the exit.

The sacrifices of sacralization and desacralization mentioned above find their analogues in the Hindu scheme of the rite; sacralization and desacralization, sometimes performed by means of subsidiary sacrifices, are the essential elements of the preparation for sacrifice and the subsequent lustration. In the most developed forms, such as the offering of *soma*, they assumed a great variety of guises; (1) the sacrificer had to pass from the world of man into a world of the gods; (2) he next he was separated from the common herd of mankind and purified; he underwent ceremonies emblematic of rebirth and was then subject to numberless taboos imposed for the purpose of maintaining his ceremonial purity. In like manner (3) the officiant prepared himself for his task; but in his case the natural sanctity of the priest relied on the necessity of undergoing all that the common man had to pass through; in fact, this was one of the causes which brought him into existence, the other being the need of a functional family with the ritual, who would avoid dangerous errors of procedure, destructive of the efficacy of the sacrifice. (3) Where there was an appointed place of sacrifice—the Temple at Jerusalem, according to later Jewish prescription—there was no need of preparation of a place of sacrifice; but the Hindu chose, each for himself, the site of his altar. (4) The necessary rites included (a) the establishment of the fires, friction being the only permitted method of kindling it, (b) the tracing on the ground of the *redi*, or magical circle, to destroy impurities, (c) the digging of the hole which constituted the real altar, (d) the preparation of the post which represented the sacrificer and to which the victim was tied, and other minor details. (5) The victim might be naturally sacred or might have to undergo sanctification. In the former case (a) individual animals might be distinguished by certain marks, or (b) the whole species might be allied to the god; in the latter case the victim had to be without blemish; (c) the age, colour or sex of the victim might differ according to the purpose of the sacrifice. It was first cleansed; then plied with laudatory epithets; and, thirdly, soothed, so that it might be more acceptable to the gods and less likely to do an injury after its death, when its spirit was set free. It had now reached a degree of sanctity and only the priest might touch it; it was sprinkled with water, and anointed with butter; finally, the priest made three turns round it with a lighted torch in his hand, which finally separated it from the world and fitted it for its high purpose. The object of the sacrifice being to bridge the gulf between the sacred and profane worlds, the sacrificer had to remain in contact with the victim, either personally, or, to avoid ritual perils, by the intermediary of the priest. After excuses made to the animal or to the species invited, the animal met the rite of desacralization, performed by all who were present. The cord was drawn tight and the victim ceased to breathe; its spirit passed into the world of the gods. But this did not conclude the ceremony, even as far as the victim was concerned; it remained to dispose of the corpse. After a rite intended to secure its perfect ceremonial purity, a part of the victim, the *ropá*, was removed, held over the fire and finally cast into it. The remainder, divided into eighteen portions, was cooked; seven fell to the sacrificer, after an invocation, which made them sacred by calling the deity to descend into the offering and thus sanctify the sacrificer. (6) Then followed the rites of desacralization, including burning of certain of the instruments, lustration of the post, destruction of the butter, &c. Finally the priest, the sacrificer and his wife performed a lustration, found in an exaggerated form in the "bath" which concluded the *soma* sacrifice, and the ceremonies were at an end.

How far this scheme of sacrifice holds good for other areas, and in particular for more primitive peoples, is an open question. Our data are nowhere so full as for India; where they are comparatively abundant they refer either to a civilized or semi-civilized people, or to an area, like West Africa, where the influence of Islam has introduced a disturbing element. Though the moralization of gods has only proceeded *param gaggub* with the moralization of mankind, the deities of the more advanced nations are perhaps felt by them to be more terrible and more difficult of access than the divinities of lower races; herein lies one explanation of the power of the priesthood. Even if the conception of the relative sanctity of gods and men remained unaltered, it by no means follows that in primitive times the same precautions were necessary in approaching the former as were demanded by the consciousness of later generations. With our present knowledge the problem of the original form of sacrifice, if it were a natural phenomenon, is partly solved. No general survey of sacrificial ritual is possible here, but a few details as to the mode of slaying the victim and disposing of the body may be given. The head of the animal or man may be cut off (and custom often requires that a single blow shall suffice), its spine broken or its heart torn out; it may be
stoned, beaten to death or shot, in pieces, drowned or buried, burned to death or hung, thrown down a precipice, strangled, or squeezed to death. The sacrifice may aim at causing a speedy death or a slow one. The corpse may be burnt, in part or as a whole; portions may be assigned to the priest, the sacrificer and the gods; the skull, bones, &c., may receive special treatment; the fat or blood may be set aside, and they or the ashes may be singled out as the share of the god, to be offered upon the altar; the skin of the victim may be employed as a covering for the idol or material representative of the god, either permanently or till the next annual sacrifice. The blood of the victim may be drunk by the priest as a means of inducing inspiration, its entrails may be employed in divination, its flesh consumed in a common meal, exposed to the birds and beasts of prey or buried in the earth.

It is equally impossible to give a general survey of the purposes of sacrifice; not only are they too numerous but it is rare to find any but mixed forms; the scapegoat, for example, is also a messenger to the dead, and its flesh is eaten by the sacrificers.

Certain main types may, however, be enumerated.

Cathartic Sacrifice.—In primitive cults the distinction between sacred and unclean is far from complete or well defined (see Table); complete association with two or more gods is found everywhere. In the Feasts of Firstfruits we have another example of the same sort; comparable with this concentration of holiness is the respect or veneration shown to a single animal as representative of its species (see Animal Worship). In both these cases the object of the rite is the elimination of impurity or of a source of danger.

But the Nazarite was equally bound to lay aside his holiness before mixing with common folk and returning to ordinary life; this he did by a sacrifice, which, with the offering of his hair upon the altar, freed him from his vow and reduced him to the same level of sanctity as ordinary men.

With regard to the scapegoat, it must be noted that we also meet with a more concrete idea of expulsion of evil (see Demonology, Exorcism), which is present among the most primitive peoples, such as the Australians. This raises the problem of how far the catharsis dealt with above is in its original form an elimination of impurity, and how far something more definite—a spirit or other principle of evil—is held to be expelled by scapegoat and allied ceremonies.

Communal Sacrifice.—In spite of the importance attached to the set of the common meal by Robertson Smith, it is not a primitive rite of adoption. The custom of eating the body of the victim does not necessarily spring from any idea of communion with the god; it may also arise from a desire to incorporate the sanctity which has been imparted to it—an idea on a level with many other food customs (see COVADE), and based on the idea that eating anything causes its qualities to pass into the eater. Where the victim is an animal specially associated with a god (the most conspicuous case is perhaps that of the corn spirit), it may be granted that the god is eaten; but precisely in these cases there is no custom of giving a portion of the victim to the god.

Defilatory Sacrifice.—The object of certain sacrifices is to provide a tutelary deity of a house, town or frontier. (a) In Burma, as in many other countries, those who die a violent death are held to haunt the place where they met their fate; consequently when a town is built living men are interred beneath the ramparts and the pillars of the gates. (b) In parts of North America the nagual or monitu animal, of which the Indian dreams during the initiation fast and which is to be his tutelary spirit, is killed with certain rites. (c) Human representatives of the corn or vegetation spirits are killed; in these, as in other cases of the sacrifice of the man-god cited by Dr Frazer, the killing of the old god is at the same time the making of a new god. (d) Suicide is treated as a means of raising a human being to the rank of a god. (e) Gods may be sacrificed (in thermomorphic form) to themselves as a means of renewing the life of the god. (f) The method of creating a fetish (see Fetishism) on the Congo resembles defilatory sacrifice; but here there is no actual slaughter of a human being; magical means are alone relied upon.

Honour Sacrifice.—Whatever their origin, sacrifices tend to be intimately associated with the gods. Man seeks to influence his fellow men in various ways, by intimidation, by deceit, by bribery; and it is quite natural to find the same ideas in the sphere of religion. Food is often given to a god because he is believed to take pleasure in eating; the germ of this idea may have been identical with that of some funerary sacrifices— to nourish the divine life. At a later period, pari passu with the spiritualization of the god, comes a refinement of the tastes attributed to him, and the finer parts of the sacrifice, finally it may be only its savour, are alone regarded as acceptable offerings. Just as attendants are provided for the dead, so the god receives sacrifices intended to put slaves at his disposal. This latter idea was the more likely to arise, as the gift theory of sacrifice is closely associated with that of the god as the ruler or king to whom man brings a tribute, just as he had to appear before his earthly king bearing gifts in his hands. The honorific sacrifice is essentially a propitiation; it must be distinguished from the piaculum (see below), to which in some aspects it is allied.

Mortuary Sacrifice.—Sacrifices, especially of human beings, are offered immediately after a death or at a longer interval. Their object may be (a) to provide a guide to the other world; (b) to supply the dead with food or other necessities suitable to his rank; (c) to send messengers to keep the dead informed of the things of this world; (d) to strengthen the dead by the blood or life of a living being, in the same way that food is offered to them or blood rituals enjoined on mourners.

Piacular Sacrifice.—Whereas the god receives a gift in the honorific sacrifice, he demands a life in the piacular. This, according to Westermarck, is the central idea of human sacrifice: the victim is substituted for the sacrificer, to deliver him from the perils by disease, famine or, more indefinitely, from the wrath of the god in general. The essential feature of the piaculum is that it is an expiation for wrong-doing, and the victim is often human.

Human Sacrifice.—Many theories of the relation of human to animal sacrifice have been put forward, most of them on an insufficient basis of facts. It has been held that animal sacrifice is the primitive form and that the decay of totemism or lack of domestic animals has brought about the substitution of a human victim; but it has also been urged that in many cases animal victims are treated like human beings and must consequently have replaced them, that human beings are smeared with the blood of sacrifice, and must therefore have been sacrificed before a milder régime allowed an animal to replace them. If tradition is any guide, human sacrifice seems in many important areas to be of secondary character; in spite of the great development of the rite among the Aztecs, tradition says that it was unknown till two hundred years before the conquest; in Polynesia human sacrifices seem to be comparatively modern; and in India they appear to have been rare among the Vedic peoples. On the whole, human sacrifice is far commoner
among the semi-civilized and barbarous races than in still lower stages of culture. In Australia, however, where sacrifice of the ordinary type is unknown, the ritual killing of a child is practised in connection with the initiation of a magician; it is therefore by no means axiomatic that animals were offered before human beings; the problem of priority is one to be solved for each area separately, but probably no solution is possible; in the absence of Aztec traditions it would hardly have seemed probable that two centuries had seen so great a transformation.

This among the forms of human sacrifice must be reckoned religious suicide. This is perhaps mainly found in India but is not unknown in Africa and other parts of the world. Human sacrifices were known in ancient India and survived till late in the 17th century (see below); both Greeks and Romans practised them, no less than the wilder races of ancient Europe. Semites and Egyptians, Peruvians and Aztecs, slew human victims; Africa, especially the West Coast, till recently saw thousands of the original to perish annually; in Polynesia, Tahiti and Fiji were great centres of the rite—in fact, it is not easy to name an area where it has not been known.

No general survey of sacrifice on geographical lines is possible, and some of the more important features in each area may be noticed.

**Sacrifice in Greece and Rome.**—Both the mainland of Greece and the Greek colonies practised human sacrifice, usually as a means towards expulsion of evil. Thus, the Athenians maintained a certain number of outcasts, from whom in times of national calamity two were selected, one for the men, one for the women, and stoned to death outside the city; at the Thargelia two victims were annually put to death in the same way. Many animal sacrifices were known; of especial importance is the annual sacrifice of a goat on the Acropolis, though at other times the animal was not permitted to enter the temple.

The most striking feature of Greek sacrifice, though not necessarily found in every rite, was the act of excommunication and pieces of wool on the victim, the gilding of its horns, the lustral of the officiant and the sprinkling of these with holy water. It was held inauspicious if the animal were unwillingly sacrificed; and if the wool was cut all was well. Barley meal was strewn on its neck, and a lock of hair cut from its forehead and burned. The animal was then clubbed, its throat cut and the altar sprinkled with its blood. Finally the body was skinned and cut up and the god's share burned on the altar.

The important Attic sacrifice of the Dipolia, known as *bouvoria*, demands some notice. Cakes were laid on the altar of Zeus Polieus and oaten driven round; the one which touched the cakes was the victim. An officiant at once struck it with his axe and another cut its throat; then all save the one who struck the first blow partook of its flesh. Then the hide was stuffed with grass and yoked to a plough; the participants were charged with this for a month and each laid the blame on the others; finally the axe was thrown into the sea. The interpretation of the rite is uncertain; it may perhaps be connected with agrarian rites.

At Rome the scapegoat did not suffer death; but in the Saturnalia a human victim seems to have been slain till the 4th century A.D. Many forms of animal sacrifice were found; the generalized account given above for Greece is true also for the Romans.

**Sacrifice in Egypt.**—Of Egyptian ritual little is known; our knowledge rests mainly on the evidence of pictures. At Deir el Bahri we see that the animal had its throat cut in Mahomedan fashion; it lay on its side, the legs tied together; the heart was taken out, then the liver; the burnt sacrifice was hardly known.

**Sacrifice in India.**—An account of animal sacrifice has been given above. Among human sacrifices may be mentioned the suicide, or custom of immolating a widow on the funerary pyre of the husband, and the Khord sacrifice of the Meriab, who was either purchased or the son of a victim father. Some days before the sacrifice, the victim, who was often kept in captivity for long periods, was devoted by the cutting of his hair, previously unshorn, and his sanctity was increased later by various ceremonies of anointing. Finally he was taken in procession, stupefied or otherwise rendered incapable of resistance, and put to death by strangulation or pressure. The remains were dismembered and carried to the fields, excepting the portion offered to the earth goddess, which was buried.

**Sacrifice in Africa.**—Especially in West Africa many forms of sacrifice are found. In the annual "customs" of Dahomey, now abolished, hundreds of human victims were offered. Three main forms of human sacrifice existed in this area: (1) the scapegoat; (2) the messenger; and (3) the expiation, but combinations were not infrequent. The victim was often kept in captivity and well fed; to transfer their sins people laid their hands upon him as he was led in procession, his head covered with ashes; on the way to the place of sacrifice were three enclosures, the second open to the chief and the priest; the third to the officiant and his helper alone; the blood of the victim was offered to the gods. At the present day the animal victim may be burned or drowned, buried in the earth or simply exposed. Sometimes the sacrificer's hands are laid on the victim before it is slain, or he may be smeared with its blood; in other cases the blood is smeared on the door posts, or the sacrificer is touched on every part of the body with the victim's body. On the Congo, if a man commits a murder, the community votes whether he shall die or be expelled; if the latter, a victim is killed, of which all must partake; but this is not, as might be imagined, a case of Robertson Smith's *piaculum* for the re-establishment of the tribal bond; for the criminal is driven out of the community.

**Sacrifice in America.**—Sacrifice was relatively infrequent and undeveloped among the Red Indians. The Pawnees, however, had an elaborate ritual, in which a human victim was sacrificed to the Morning Star. The blood of the victim was sprinkled on the fields, and the details of the rite are not unlike those of the Khord custom. The Iroquois sacrifice of the white dog boar in later times the character of a scapegoat festival; but it is doubtful how far this was an original feature. The animals were decorated with wampum and strangled, and then the skins of the victims were transferred to them; then the remains were burned and the ashes gathered up, taken through the village and sprinkled before every house. In Mexico human sacrifices were very common; the lowest estimate is 25,000 annually. The victims were often fisted for a whole year and treated as divine; the heart was an offering to the god, the body was eaten by the priests and nobles and the head was preserved with those of previous victims.

(N. W. T.)

**The Idea of Sacrifice in the Christian Church.**

There can be no doubt that the idea of sacrifice occupied an important place in early Christianity. It had been a fundamental element of both Jewish and Gentile religions, and Christianity tended rather to absorb and modify such elements than to abolish them. To a great extent the idea had been modified already. Among the Jews the preaching of the prophets had been a constant protest against the grosser forms of sacrifice; and there are indications that when Christianity arose bloody sacrifices were already beginning to fall into disuse; a saying which was attributed by the Ebionites to Christ repeats this
protest in a strong form, "I have come to abolish the sacrifices; and if ye do not cease from sacrificing the wrath of God will not cease from you" (Epiph. xxx. 16). Among the Greeks the philosophers had come to use both argument and ridicule against the idea that the offering of material things could be needed by or acceptable to the Maker of them all. Among both Jews and Greeks the earlier forms of the idea had been rationalized into the belief that the most appropriate offering to God is that of a pure and penitent heart, and among them both was the idea that the vocal expression of contrition in prayer or of gratitude in praise is also acceptable. The best instances of these ideas in the Old Testament are in Psalms i. and li., and in Greek literature the striking words which Porphry quotes from an earlier writer, "We ought, then, having been united and made like to God, to offer our own conduct as a holy sacrifice to Him, the same being also a hymn and our salvation in passionless excellence of soul" (Euseb. Dem. ev. 3). The ideas are also found both in the New Testament and in early Christian literature; "Let us offer up a sacrifice of praise to God continually, that is, the fruit of lips which make confession to His name" (Heb. xiii. 15); "That prayers and thanksgivings, made by worthy persons, are the only perfect and acceptable sacrifices I also admit" (Just. Mart. Trypho, c. 177); "We honour God in prayer, and offer this as the best and holiest sacrifice with righteousness to the righteous Word" (Clem. Alex. Strom. vii. 6).

But among the Jews two other forms of the idea expressed themselves in usages which have been perpetuated in Christianity, and one of which has had a singular importance for the Christian world. The one form, which probably arose from the conception of Yahweh as in an especial sense the protector of the poor, was that gifts to God may properly be bestowed on the needy, and that consequently alms have the virtue of a sacrifice. Biblical instances of this idea are—"He who doeth alms is offering a sacrifice of praise" (Ecclus. xxxii. 2); "To do good and to communicate forget not, for with such sacrifices God is well pleased" (Heb. xii. 16); so the offerings sent by the Philippians to Paul when a prisoner at Rome are an "odour of a sweet smell, a sacrifice acceptable, well pleasing to God" (Phil. iv. 18). The other form, which was probably a relic of the conception of Yahweh as the author of natural fertility, was that part of the fruits of the earth should be offered to God in acknowledgment of His bounty, and that what was so offered was especially blessed and brought a blessing upon both those who offered it and those who afterwards partook of it. The persistence of this form of the idea of sacrifice constitutes so marked a feature of the history of Christianity as to require a detailed account of it.

In the first instance it is probable that among Christians, as among Jews, every meal, and especially every social meal, was regarded as being in some sense a thank-offering. Thanksgiving, blessing and offering were co-ordinate terms. Hence the Talmudic rule, "A man shall not taste anything before blessing it" (Joseph. Berachoth, c. 4), and hence St Paul's words, "He that sacrificeth to the Lord, for he giveth God thanks" (Rom. xiv. 6; cp. 1 Tim. iv. 5). But the most important offering was the solemn oblation in the assembly on the Lord's day.

A precedent for making such oblations elsewhere than in the temple had been afforded by the Essenes, who had endeavoured in that way to avoid the contact with unclean persons and things which a resort to the temple might have involved (Jos. Antiq. xviii. 1, 5), and a justification for it was found in the prophecy of Malachi, "In every place incense is offered unto my name and a pure offering; for my name is great among the Gentiles, saith the Lord of hosts" (Mal. i. 11, repeatedly quoted in early Christian writings, e.g. Teaching of the Twelve Apostles, c. 14; Just. Mart. Trypho, c. 28, 41, 116; Irenaeus iv. 17, 5).

The points in relation to this offering which are clearly demonstrable from the Christian writers of the first two centuries, but which subsequent theories have tended to confuse, are these. (1) It was regarded as a true offering or sacrifice; for in the Teaching of the Twelve Apostles, in Justin Martyr and in Irenaeus it is designated by each of the terms which are used to designate sacrifices in the Old Testament. (2) It was primarily an offering of the fruits of the earth to the Creator; this is clear from both Justin Martyr and Irenaeus, the latter of whom not only explicitly states that such oblations are continued among Christians, but also meets the current objection to them by arguing that they are offered to God not as though He needed anything but to show the gratitude of the offerer (Iren. iv. 17, 18). (3) It was offered as a thanksgiving partly for creation and preservation and partly for redemption: the latter is the special purpose mentioned (e.g.) in the Teaching of the Twelve Apostles; the former is that upon which Irenaeus chiefly dwells; both are mentioned together in Justin Martyr (Trypho, c. 41). (4) Those who offered it were required to be not only baptized Christians but also "in love and charity one with another"; there is an indication of this latter requirement in the Sermon on the Mount (Matt. xix. 24, where the word translated "gift" is the usual LXX. word for a sacrificial offering, and is so used elsewhere in the same Gospel, viz. Matt. viii. 4, xxiii. 19), and still more explicitly in the Teaching, c. 14, "Let not any one who has a dispute with his fellow come together with you (i.e. on the Lord's day) until they have been reconciled, that your sacrifice be not defiled." This brotherly unity was symbolized by the kiss of peace. (5) It was offered in the assembly by the hands of the president; this is stated by Justin Martyr (Apol. i. 65, 67), and implied by Clement of Rome (Ep. i. 44. 4).

Combined with this sacrifice of the fruits of the earth to the Creator in memory of creation and redemption, and probably always immediately following it, was the sacred meal at which part of the offerings was eaten. Such a sacred meal had always, or almost always, formed part of the rites of sacrifice. There was the idea that what had been solemnly offered to God was especially honoured by Him, and that the partaking of it united the partakers in a special bond both to Him and to one another. In the case of the bread and wine of the Christian sacrifice, it was believed that, after having been offered and blessed, they became to those who partook of them the body and blood of Christ. This "communion of the body and blood of Christ," which in early writings is clearly distinguished from the thank-offering which preceded it, and which furnished the materials for it, gradually came to supersede the thank-offering in importance, and to exercise a reflex influence upon it. In the time of Cyprian, though not before, we begin to find the idea that the body and blood of Christ were not merely partaken of by the worshippers but also offered in sacrifice, and that the Eucharist was not so much a thank-offering for creation and redemption as a repetition or a showing forth anew of the self-sacrifice of Christ. This idea is repeated in Ambrose and Augustine, and has since been a dominant idea of both Eastern and Western Christendom. But, though dominant, it has not been universal; nor did it become dominant until several centuries after its first promulgation. The history of it has yet to be written. For, in spite of the important controversies to which it has given birth, no one has been at the pains to distinguish between (i.) the theories which have been from time to time put forth by certain writers, and which, though they have in some cases ultimately won a general acceptance, have for a long period remained as merely individual opinions, and (ii.) the current beliefs of the great body of Christians which are expressed in recognized formularies. A catena of opinions may be produced in favour of almost any theory; but formularies express the collective or average belief of any given period, and changes in them are a sure indication that there has been a general change in ideas.

It is clear from the evidence of the early Western liturgies that, for at least six centuries, the primitive conception of the nature of the Christian sacrifice remained. There is a clear distinction between the sacrifice and the communion which followed it, and that which is offered consists of the fruits of the earth and not of the body and blood of Christ. Other ideas no doubt attached themselves to the primitive conception, of which there is no certain evidence in primitive times, e.g. the idea of the propitiatory character of the offering, but these
of causes which have not yet been fully investigated, the theory which is first found in Cyprian became the dominant belief of Western Christendom. The central point of the sacrificial idea was shifted from the offering of the fruits of the earth to the offering of the body and blood of Christ. The change is marked in the rituals by the duplication of the liturgical forms. The prayers of intercession and oblation, which in earlier times are found only in connexion with the former offering, are repeated in the course of the same service in connexion with the latter. The designations and epithets which in earlier times applied to the fruits of the earth are applied to the body and blood. From that time until the Reformation the Christian sacrifice was all but universally regarded as the offering of the body and blood of Christ. The innumerable theories which were framed as to the precise nature of the offering and as to the precise change in the elements all implied that conception of it. It still remains as the accepted doctrine of the Church of Rome. For, although the council of Trent recognized fully the distinction which has been mentioned above between the Eucharist and the sacrifice of the mass, and treated of them in separate sessions (the former in Session xiii., the latter in Session xxii.), it continued the medieval theory of the nature of the latter. The reaction against the medieval theology at the time of the Reformation took the form of a return to what had no doubt been an early belief,—the idea that the Christian sacrifice consists in the offering of a pure heart and of vocal thanksgiving. Luther at one period (in his treatise De captivitate Babylonica) maintained, though not on historical grounds, that the offering of the oblations of the people was the real origin of the conception of the sacrifice of the mass; but he directed all the force of his vehement polemic against the idea that any other sacrifice could be efficacious besides the sacrifice of Christ. In the majority of Protestant communities the idea of a sacrifice has almost lapsed. That which among Catholics is most commonly regarded in its aspect as an offering and spoken of as the “mass” is usually regarded in its aspect as a participation in the symbols of Christ’s death and spoken of as the “communion.” But it may be inferred from the considerable progress of the Anglo-Catholic revival in most English-speaking countries that the idea of sacrifice has not yet ceased to be an important element in the general conception of religion.

(SACRILEGE, the violation or profanation of sacred things, a crime of varying scope in different religions. It is naturally much more general and accounted more dreadful in those primitive religions in which cultual objects play so great a part, than in more highly spiritualized religions where they tend to disappear. But wherever the idea of sacred exists, sacrilege is possible. The word itself comes from the Lat. sacrilegium, which originally meant merely the theft of sacred things, although already in Cicero’s time it had grown to include in popular speech any insult or injury to them.

The history of sacrilege reflects a large phase of the evolution of religion. In primitive religions inclusive of almost every serious offence even in fields now regarded as merely social or political, its scope is gradually lessened to a single part of one section of ecclesiastical criminology, following inversely the development of the idea of holiness from the concrete to the abstract, from fetishism to mysticism. The primitive defence against sacrilege lay directly in the nature of sacred things, those that held a curse for any violation or profanation. This brings us at once into the whole field of taboo (q.v.). From it we pass without a break, merely narrowing the application as the conception of sacredness grew clearer and less associated with magic, into early criminal law with its physical sanctions. The Levitical code exacts of the offender reparation for the damage with the addition of one-fifth of the amount, and an expiatory sacrifice (Lev. v. 15, 16). Even the gold and silver ornaments of the images of false gods were not to be coveted nor appropriated for fear of being contaminated with the curse which they could impart (cf. Deut. vii. 25). The tragic story of the stoning of Achan, who stole some of the spoils of Jericho which Joshua had consecrated to the treasury of Yahweh, is one of the most

No religion was more prodigal in rules to safeguard that which was holy or consecrated than the Jewish, especially in its temple laws; violation of them often led to mob violence as well as divine chastisement. The temple rules do not apply to synagogues, however, and unless conduct in them is liable only to civil action. The whole wide field of Jewish taboo naturally involves sacrilege as its reverse side. Such violations of holy things as making mockery of the Scriptures, or even reciting them as one would ordinary literature, was sacrilege in the eyes of the rabbi. Even imitation of the style of the Talmud has also been accounted sacrilege.

While the Roman cults were amply protected by taboos, there was no comprehensive term in Roman law for religious violations and profanations in general. Sacrilegium was narrowly construed as the theft of sacred things from a sacred place. Sacred things, according to Gaius, were those things that had been definitely consecrated to the gods—and so had come to partake of their holiness. Sacred places did not include private shrines. According to Ulpian the punishment for sacrilegium varied according to the position and standing of the culprit and the circumstances under which the crime was committed. For the lower classes it was crucifixion, burning or the wild beasts. The latter penalty was also attached to theft of sacred things by night, but stealing by day from a temple objects of little value brought only sentence to the mines. People of higher rank were deported. During classical times the law kept to the narrow meaning of sacrilegium, but in popular usage it had grown to mean about the same as the English word. Traces of this usage are frequent in Augustan writers. The early church Fathers use the word most frequently in the restricted sense, although an effort has been made to read the wider meaning in Tertullian. But by the middle of the 4th century the narrower meaning had disappeared. In Ambrose, Augustine and Leo I., sacrilegium means sacrilege. The wider meaning had invaded the law as well. Mommsen was of the opinion that sacrilegium had no settled meaning in the laws of the 4th century. But it was rather that an enlarged application of the idea of sacred made the crime of sacrilege in the sense of violatio sacri a more general one. This was partly due to the influence of Christianity, which so obscured the view that rather than merely those things consecrated in pagan cults, partly to the efforts of the later emperors to surround themselves and everything emanating from them with higher sanctions. In the Theodosian Code the various crimes which are accounted sacrilege include—apostasy, heresy, schism, Judaism, paganism, attempts against the immunities of churches and clergy or privileges of church courts, the desecration of sacraments, &c. and even Sunday. Along with these crimes against religion went treason to the emperor, offences against the laws, especially counterfeiting, defraudation in taxes, seizure of confiscated property, evil conduct of imperial officers, &c. There is no formal definition of sacrilege in the code of Justinian but the conception remains as wide. The church had found in the imperial law a strong protector.

The penitentials (q.v.), or early collections of disciplinary canons, gave much attention to sacrilege. In the earliest of them, sacrilege in the narrower sense is not a separate class of crime, but the wider usage goes with variations through the different collections. The inclusion of the greatest difference in the penalties assigned, reaching from little offenses of desecration of property to penance of one to five or even fifteen years. The Frankish synods emphasize the crime of seizing church property of every kind, including the vast estates so envied by the lay nobility. In the Pseudo-Isidore the attempt was made to include even property on which the church had merely a legal claim. The murder or injury of the clergy is also sacrilege in both penitentials and capitularies. The practice of magic, superstition, &c., are also frequently referred to as sacrilege, especially during the long struggle with German heathenism. With the definite triumph of the church, the profanation of its sanctuaries became less frequent, and once robbery or seizure of ecclesiastical possessions or violation of its privileges tended to absorb the attention of synods and councils. Gratian's Decretum mirrors two tendencies, the church legislation with its growingly less extended application, and the wide meaning as in Justinian's Code, owing to the revival of Roman law in the 11th century. It thus was once more declared to include all violations of the divine law. A somewhat distorted, but well-substantiated use of the word sacrilegium in medieval Latin was its application to the fine paid by one guilty of sacrilege to the bishop. The penalties in the canon law included, in addition to restitution, penance, fines and excommunication; and right of asylum was denied to the culprit. The jurisdiction was something jointly shared with the temporal power in case corporal punishment were involved. The numerous enactments of councils to ensure the proper care of church property, prohibiting the use of churches for secular purposes, for the storing of grain or valuables, for dances and merry-making, do not technically come under the head of legislation against sacrilege. The worst sacrilege of all, defiling the Host, is mentioned frequently, and generally brought the death penalty accompanied by the cruellest and most ignominious tortures. The period of the Romanization and its consequences increased the number of crimes. Under the emperor Charles V. the penalty for stealing the Host was the stake; that for other crimes was graded accordingly. In France, in 1561, under Charles IX. it was forbidden under penalty of death to demolish crosses and images and to commit other acts of scandal and impious sedition. In the declaration of 1682, Louis XIV. decreed the same penalty for sacrilege joined to superstition and impiety, and in the somewhat belated religious persecution of the duke of Bourbon in 1724 those convicted of larceny in churches, together with their accomplices, were condemned, the men to the galleys for life or for a term of years, the women to be branded with the letter V and imprisoned for life, or for a term. When one takes into account that the next article of the declaration decreed death for domestic theft, the legislation is not relatively cruel. Yet even in the enlightened 18th century popular fanaticism made of sacrilege the most heinous offence. The trial of La Barre in 1766 at Abbeville (see Voltaire) is the most famous in modern times. Convicted of wearing his hat while a religious procession was in progress, he was sentenced to be hanged, drawn and quartered, having mutilated a crucifix standing on the town bridge. Declared guilty, after torture, he was sentenced to have his tongue cut out, to be beheaded and the body to be burned, a sentence which was confirmed by the parlement of Paris and the bigoted king Louis XV. In the midst of the French Revolution respect for civic festivals was sternly enacted, but sacrilege was an almost daily matter of state policy. In the penal code the penalty for interfering with and molesting worshippers is slight, a fine of from 10 to 300 francs and prison from six days to three months, while damage or insult to the objects of worship brought only 10 francs to 500 francs fine, and prison from fifteen days to six months. In 1825 the reactionary parliament once more brought back the middle ages, by decreeing the death penalty for public profanation, the execution to be preceded by the amende honorable before the church doors. "Theft sacrilege" was treated in a separate series of equally savage clauses. This was a crime not recognized in the penal code, which was therefore to be modified by this law. No attenuating circumstances were to be recognized, as in the general scheme of the penal code. This odious legislation was expressly and summarily abrogated in 1830. (J.T.S.)

English Law.—In English law, sacrilege is the breaking into a place of worship and stealing therefrom. At common law benefit of clergy was denied to robbers of churches. A statute of 1553 made the breaking or defacing of an altar, crucifix or cross in any church, chapel or churchyard punishable with three months imprisonment on conviction before two justices, the imprisonment to be continued unless the offender entered into surety for good behaviour at quarter sessions. The tendency of the later law has been to put the offence of sacrilege in the same position as if the offence had not been committed in a sacred building. Thus breaking into a place of worship at night, says Coke, is burglary, for the church is the mansion house
SACRISTY—SADDLERY

of Almighty God. The Larceny Act of 1861 punishes the breaking into, or out of, a place of divine worship in the same way as burglary, and the theft of things sacred in the same way as larceny. Now by the Malicious Damage Act 1861 the unlawful and malicious destroying or damaging any picture, statue, monument or other memorial of the dead, painted glass or other monument or work of art, in any church, chapel, meeting-place or other place of divine worship is a misdemeanour punishable by imprisonment for six months, and in the case of a male under the age of sixteen by imprisonment with whipping.

SACRISTY (through Fr. sacristie, from med. Lat. sacristia or sacrismus), the term in ecclesiastical architecture given to the room or hall in a large church wherein are kept the vestments and utensils (sacra) used in the services and celebrations. Like the diaconicon in the Greek Church, it was usually situated on the north side of the chancel, but its position varies according to that of the chapter-house, as it is generally placed between the latter and the church.

SACRO BOSCO, JOHANNES DE [JOHN HOLYWOD] (d. 1244 or 1256), astronomical author, studied at Oxford and was afterwards professor of mathematics at the university of Paris. He wrote a treatise on spherical astronomy, Tractatus de spherae, first printed at Ferrara in 1472. This was the second astronomical work to be printed. Although recording no advance on the Arabian commentaries on Ptolemy, it gained a great reputation; twenty-four editions appeared before 1500, and at least forty between 1500 and 1647, in which year the last edition was published at Leiden. About the year 1232 he wrote De annis ratione or De computo ecclesiastico (printed editions at Paris in 1538 (?), 1550, 1572 and at Antwerp in 1547 and 1560), in which he points out the increasing error of the Julian calendar, and suggests a remedy which is nearly the same as that actually used under Gregory XIII. three hundred and fifty years later. He also wrote Algorismus or De arte numerandi, printed in 1454 (Vienna), in 1517 (Vienna), 1521 (Cracow), 1523 (Venice); De astrolabio and Brevarium juris.

SADDLE (a word common to Teutonic languages, cf. Ger. Sattel, Dut. zadel, also in Russ. sidlo and Lat. sedella, for sedola; it is not derived directly from Lat. sedella, which means a chair, but all the words are to be referred to the root sed-, which gives Lat. sedere, Eng. "sit," "settle," "seat," &c.), a seat, usually of leather, fixed by girths to the back of a horse for riding; also a padded cushion for the back of a draught horse, fastened by girths and crupper; to it are attached the supports for the shafts, and rings for the reins (see SADDLERY). The word is also applied to many objects resembling a saddle in shape or function, such as, for example, to support a spar in a ship, or in machinery to support a rod, or in masonry (q.v.) the top or "apex stone" of the gable of a roof, &c.

Saddle bars, in architecture (Fr. traverses), are narrow horizontal iron bars passing from mullion to mullion, and often through the whole window from side to side, to steady the stone work, and to form stays, to which the lead work is secured. When the bays of the windows are wide, the lead lights are further strengthened by upright bars, passing through eyes forged on the saddle bars, and called stanchions. When saddle bars pass right through the mullions in one piece, and are secured to the jambs, they have sometimes been called "stay bars."

SADDLERY AND HARNESS, two terms which embrace the whole equipment for the horse when used for riding or driving. "Harnass" (O. Fr. harnets, mod. harnais, Ger. Harnisch, of unknown origin) was originally a general term for equipment, e.g. the body armour of a soldier. It is now usually confined to the draught horse's equipment, "saddle and bridle" being used for the riding horse.

Saddlery is principally a leather trade, and the craft has been established in England as a separate trade since the 13th century, when the London Saddlers' Company received its charter from Edward I. There is evidence also of its early prosperity at Birmingham, where there was a "Company of Saddlers and Harness-makers of Walsall." Saddler's ironmongery embraces the making of buckles, chains, stirrups, spurs, bits, hames, &c.

The "bridle" (O.E. bridel for bridgel, from bredgan, to pull) is the combination of straps and buckles which fits on the horse's head, the headstall, together with the bit and reins which it keeps in position. The headstall consists of the headpiece passing behind the ears and joining the headstall over the forehead; the cheek-straps run down to the bit to which they are fastened; in the driving bridle the "blinkers," rectangular or round leather flaps which prevent the horse from seeing anything except what lies in front, are attached to the cheek-straps; the nose-band passes round the head above the nostrils and is crossed by a flash from the top of the cheek-straps under the head. The "mammoth" passes between the horse's legs with one end fastened to the girth and the other to the bridle or nose-band. It prevents the horse throwing up its head. The bit is the metal contrivance inserted in the mouth to which the reins are attached. There are innumerable patterns of bits, but they may be divided into the "snaffle" (Du. snael, horse's muzzle), the "curb" and combinations of the two. The "snaffle" for the riding horse has a smooth jointed steel mouthpiece, with straight cheek-bars, the rings for the reins and cheek-pieces of the headstall being fixed in the bars at the junction with the mouthpiece. A severer snaffle has the mouthpiece twisted and fluted. The bars prevent the horse pulling the bit through the mouth. The snaffle without bars is generally termed a "bridle," and the headstall is divided into the "bridle-bit" (Fr. courbe, Lat. curvus, bent, crooked) is one to which a curb-chain or strap is attached, fastened to hooks on the upper ends of the cheek-bars of the bit and passing under the horse's lower jaw in the chin groove. The reins are attached to rings at the lower ends of the chin-groove, the bit being thus pressing the curb-chain against the jaw. The mouthpiece of the curb-bit is unjointed and in the centre a "port," i.e. a raised curve allowing liberty for the tongue and bringing the pressure on the head to the mouth. The headstall is divided into two parts, the lower ends having rings or in the plain curb-bit.

FIG. 2.—Some Types of Driving Bits. (From Messrs. Champion and Wilton.)

The riding saddle is composed of the "tree," the framework or skeleton, the parts of which are the pommel or head, the projection against which fits on the withers, and the side bars which curve into the cantle or hind-hob. The tree in the best saddles is made of beechwood split with the grain; thin canvas is glued over the wood to prevent splitting, and iron or steel plates then riveted on the tree form the "reed" of the saddle. Linnen webs are fastened lengthwise and across, over which is nailed canvas and serge between which the padding is stuffed. To the tree are fastened the stirrup-bars. The leather covering of the tree should be of pig-skin; cheap saddles are made with a leather-like artificial skin surface. Of the several parts of the man's saddle the seat, the skirt, i.e. the fold or pad of leather on either side of the head, and the hanging flaps; knee-rolls are not used as much as they were, except where roughly broken-in horses are ridden. The saddle is cut straight over the withers and square-ended cantle, as in the hunting saddle, or cut back over the withers with a round-ended cantle, as in the polo saddle. The saddles in use on the continent of Europe still retain the high pommel and cantle and heavy knee-rolls discarded by riders trained in the British school and the hunting-field. The saddles of the East and of the Arabs keep their primitive shape, and they are really seats in which rather than on which the rider sits. The Mexican saddle, with its long flaps, is much used in the western United States. It has a very high padded pommel and a round-headed projecting cantle.

The lady's side-saddle when first fully developed had two heads or pomells, between which the right leg was supported, the support for the left being the stirrup. The third pommel or "leaping head" which the left leg rests, was, it is said, invented as the result of a match between two gentleman riders to ride a steeplechase on side-saddles; the winner had provided himself this support for his left leg. At first the "leaping head" was only used in the...
hunting-field and the double cow-horn was still retained; as its usefulness became apparent the second pommel practically disappeared.

Space forbids the discussion of the varieties of harness for the pair-horse carriage, the four-horse carriage, the farm wagon, &c. or the various kinds of ornamentation that are or have been lavished upon it. The leather collar, heavily padded, passes over the head and

**Fig. 3.** a. Side-saddle; b, hunting saddle; c, officer's regulation saddle (British army). (From models made by Messrs Champion and Wilton.)

rests firmly on the shoulders; the hames, linked pieces of metal, fit tightly round it and are fastened at the top by the hame-strap; they bear the traces, or straps which pass along the horse's sides and the shafts and are secured by loops slipped over hooks in the body of the carriage. Where the collar is dispensed with, the traces are attached to a breast-strap against which the horse works. This breast harness is much used for the lightly harnessed American trotting horse. The saddle is a narrow leather girthed under the belly and held in position by the crupper-dock and the crupper, a loop strap passing under the tail. The saddle supports the shafts by the back-band and its tugs and by the belly-band. A loop strap passes from the bit through a term or rings on the hams and the pad. The harness on the horse's hind-quarters consists of the breeching, passing round behind the horse and helping in backing and stopping the vehicle, the hip-strap fastened to the breeching and passing over the hind-quarters, and the kicking-strap fastened across the rear of the body. The reins are slip reins, when used merely as a support to the head, or as an aid to the improvement of the paces, consists of a separate bridoon-bit with the reins passing through rings on the throat-band and thence slipped over the head. The bit, which is not fastened to the head, passes over the head-stall, keeps the horse's head up in a cramped attitude and the mouth continually working on the bit. A recent modification of the server form is not attached to the bit.

In the history of mankind when the horse was first trained for draught and riding for are for archaeologists and anthropologists to discuss (see HORSE, § History). With the domestication of the horse came the development of the art of riding. The horseman glided into the mouth, finally replaced by wood or bone. Stone age objects have been found in lake-dwellings, such as that at Robenhausen, near Zürich which may have been bits; one is slightly curved, the other has a straight head, the latter having a flat slotted in the mouth, finally replaced by wood or bone. Stone age objects have been found in lake-dwellings, such as that at Robenhausen, near Zürich which may have been bits; one is slightly curved, the other has a straight head, the latter having a flat head. The bit from the bronze age and the iron age are seen in most museums showing that the forms have changed little. The Scandinavian museums are particularly rich in early remains of harness and saddles. The remains of the Thracian horse, the so-called Thracian trident, which has been found in the National Museum at Zürich. In the late iron age burial of a Gaulish chieftain at Somme-Bionne were found two horse's bits of the ordinary jointed snaffle type (see ARCHAEOLOGY, plate IV). The other is a snaffle unjointed bit with red and blue enamel ornamentation; it is illustrated in Late Iron Age. Assyrian and Babylonian monuments show the harness of the chariot horses and the bridling of the riding horse, cf. BABYLONIA and ASSYRIA, Plate II, fig. 2.

In ancient Greece and Rome the bit and bridle were used during historic times, and allusions to riding without them refer to exhibitions of horsemanship. On Trajan's column the Numidians ride without bridles or bits; and various North African tribes trained their horses to obey their voice alone (cf. Claudian, Epig. 1, 10, of the Gaulish essardari, driving without bridle and reins). The locus classicus for the bridling and saddling of the Greek horse is Xenophon, *Hippis* (i.e. *Hippis*). The Greek name for the bridle bit and reins collectively is *xymar* (Lat. *xylarium*). The bridle is also used of the bit itself. The headstall (*kyparissia*) and straps (*toxidia*) were richly decorated. In Homer (II. iv. 142) the latter are ornamented with ivory plates stained with purple, and such have been found in Egypt. An ivory bit of ancient type is illustrated in the Museum of American Art, New York (XIV. 14). The head-band also bore a crest (kabides, crista); and in front of the horse's *frontale* might be extended down the face to serve as a defence, as in the medieval chaufrein. This frontal was a special subject of decoration. Of the two principal types of ancient bits, the un-

and the jointed mouthpiece, the latter is the most common form. There are also other forms of bits; those with sharp points were called *lispata* (Virg. Georg. iii. 208). There is a Greek bit in the British Museum with revolving devices, a device which occurs in the *Hippis*, which has been used to explain the method of giving the mouth to certain horses by means of the bit. The curb was also used: Xenophon distinguishes between the snaffle (*lepos xalados*) and the curb. The curb or strap was chain or *wroxaXulados* or *phalos*, which, however, may mean a maul. A bronze bit or *kabides* has a jointed metal mouthpiece and a plain curved bar acting as a curb-strap. The cheek-bars of the curb take a variety of forms: straight bars, circles with rings, square or oblong plaques, triangles and the swan-necked S-shaped type all found. In modern times complicated and severe bits were used, and heavy bits with cruel mouthpieces and long elaborately curved check-bars are still used by Arabs and the riders of Central and South America. The bit of the armed war horse in the middle ages was sometimes provided with very long check-bars fitted with brass or iron rings. The English, however, have always been slow to adopt such a device, the capture of a horse being held in the hold of the bridle (see R. Tschilke and R. Forrer, *Die Pferdenasse in ihrer Formen-Entwicklung,* 1903, for illustrations of bits from prehistoric times to the 16th century).

The saddle was not used in Egypt, and the richly ornamented saddle-cloths of the ancient Egyptians (the so-called *harnasses*). The ancient Greeks rode bare-backed as in the Panathenic fritter of the Pythea or used a saddle-cloth (*podgopos, phalas* applied to a saddle is quite late). Even the Romans did not always use a saddle but a saddle-cloth (*pavimentum*) is sometimes mentioned. A 6th-century vase, found at Daphne, Lower Egypt (Flinders Petrie and Murray, *Tanis,* 1888, ii. pl. xxix), shows a woman riding astride on a cloth, with fully developed headstall and powerful bit. A curious sarcoynd sarcophagus from Clazomeines, shows a long pointed *epiophium* with a chest-strap. These indicate Asiatic influence, for Daphne was an Ionian and Carian settlement of the 7th century B.C. In Xenophon (Isc) we find the ***saddle-cloth*** and its appurtenances of riders, and from his advice to the seat to be adopted pads or rolls seem to have been added. There were no stirrups (till the time of the emperor Maurice, A.D. 602), and the rider mounted at a vault or by blocks; for the sport of equestrianism has been considered as an athletic feat. On a funeral monument of the time of Nero in the museum at Mainz is the figure of a horseman on a saddle-cloth with something resembling the pommel and cantle of a saddle, but the saddle proper is found in the so-called column of Theodotius at Constantinople (usually ascribed to the end of the 2nd or A.D., though it may be more than 100 years earlier), where two figures are riding on high-peaked saddles resting on embroidered saddle-cloths. In medieval times the saddle was much like that of the Oriental saddle of to-day with small padded panels. Some military saddles of the 14th and 15th century the front parts of the saddle were armoured and extended to protect the legs of the rider. The jousting saddle (cf. the example in the Tower of London) becomes a large and massive square, with a box into which the rider's limbs are placed, and around which the rider's limbs are sometimes placed, and around which the rider seems to have lifted himself to practically a standing position in the stirrups. The saddle for use on the road or hunting was much like the Arab saddle of to-day, and similar forms were in use in Europe and elsewhere where the British saddle had not been adopted. Women rode astride or on a pillow behind a male rider. The side-saddle is said to date from the end of the 12th century. For the harness of the ancient draught horse see CHARIOT.

SADDLEWORTH, a civil parish district in the Colne Valley parliamentary division of the West Riding of Yorkshire, England, 14 m. N.E. of Manchester, on the London & North Western railway. Pop. (1901) 12,300. It lies on the western side of the elevation of Stanedge, which here forms the watershed between streams flowing westward to the Irish Sea and eastward to the North Sea. Early earthworks and tumuli are numerous in the locality. The Huddersfield canal follows the valley, and, like the railway, is carried under Stanedge by a long tunnel.

SADDUCEES, a sect or party of the Jews mentioned in the historical books of the New Testament (with the exception of the fourth Gospel), by Josephus, and in the Talmud. According to all the authorities, the essential qualification for the title is the denial of certain beliefs which the Pharisees held to be implicitly contained in Scripture, and therefore necessarily part of Judaism as soon as they were formulated. From their own point of view they were orthodox conservatives, so far as they really cared to remain—for whatever reason—with the pale of Jewry and
SADE—SÁ DE MIRANDA

990

to justify their presence there. From the standpoint of the Pharisees who championed the hope of everlasting life and believed in the existence of angels, through whom God could communicate with men, they were infidels. As the Pharisees accumulated the oral tradition which was afterwards codified and elaborated or preserved by fragments, which served some useful purpose, and other Rabbinic writings, the Sadducees acquired concrete regulations to oppose so long as they dared. The Pharisees even improved upon the Temple ritual, and their popularity enabled them to force the Sadducees into adopting the improvements.

But though some of those who bore the title may be reckoned at their best as orthodox conservatives, their position was, as far as our mainly Pharisaic authorities permit us to learn, merely negative; and all the information we possess, whether it rests on facts or on prejudice, points to their close affinity with the Jews who renounced their faith altogether and advertised the fact—say by habitual and unwarranted breach of the Sabbath, for example. In fact, broadly speaking, the Sadducees for the period during which they are reported to exist, represent and embody the tendency to conformity with neighbouring Gentiles, which is deplored and advertised by writers from Philo to Christianity and to Pseudo-Cyprian. Hence it can be said that idolatry was an outward symbol of a real indebtedness to idolaters which is not necessarily wiped out when the tangible idols are smashed.

Idolatry is plainly incompatible with the law of Moses: so were Greek caps; but the Jews who conformed to Hellenism in the time of Antiochus Epiphanes acquired much that was conserved and utilized in that great attempt to convert the Greek world to Judaism, whose best monument is the works of Philo. The process is normal: first, there is an unqualified adoption of a foreign culture by the Sadducees of the time being: then, after unqualified opposition, the Pharisees of the time admit whatever is admissible within the four corners of the Law and are confronted by other Sadducees who have not followed the first into temporary or permanent separation from the existing Jewish way of life and absorption in the immediate foreign environment, and who, therefore, will have none of the current innovations which the Pharisees have in course of time selected as capable of assimilation and reconciliation with the existing body of growing doctrine and practice. The Jews spoiled the Egyptians: some made a golden calf and worshipped it: others destroyed it and turned the spoils into vessels for the sanctuary: some again sighed for the flesheats of Egypt, if they did not actually return thither.

The controversies of the Pharisees and Sadducees afford a typical example of this process. With the approval of Antiochus Epiphanes, the Sadducean section embraced the outward forms of Hellenism, and out of the persecution of the orthodox which followed was born the hope of a future life which was in the circumstances the necessary corollary of God's righteousness and was discovered to be latent in Scripture. Later Sadducees, who actually bore the name, resisted this and all the characteristics of the Pharisees and continued to flatter the predominant foreigner—Greek or Roman—by imitating him with less reckless bravado than the first Hellenizers and with growing assurance. They were men of the world, and men of this world, and, so far as they still professed and practised Judaism, they preferred to repudiate the additions for which they felt no need, but which had entered into the faith of their fathers. The Pharisees, who pruned and fed the tree of Judaism so that it might bear fruit for the healing of the Nation—and the nations in the latter days—gave them the opportunity of posing as the champions of the primitive standards. But, though the reformers thus played into the hands of the Sadducees, the people were not deceived by the badge which Sadducean priests adopted and paraded to save their faces: they loved the Pharisees and would willingly have gone to their length. The Sadducees were the hypocrites of the Jewish world, just as the Epicureans were the hypocrites of the Greek world. The rest of the Jews rated the Sadducees as atheists, just as the rest of the Greeks rated the Epicureans as atheists and discerned, as Plutarch said, the sardonic grin behind the mask of their obsequious devotion to the ceremonies at which the force of public opinion compelled their attendance. The Sadducee was a Jew outwardly so long as he so retained place, power and profit. The destruction of Jerusalem, long before it was consummated A.D. 70, robbed them of the place and nation which alone compensated them for the inconveniences of their alignment with the alien power of the invincible Rome: and her advance warned them to take for themselves and their talents to the market of the wide world, to which in heart and mind they had always belonged.

Josephus (Ant. xiii, 5, 9, §§ 171-173, Niese) introduces the Sadducees along with the Pharisees and Essenes in his account of Jonathan's reign (161-143 B.C.) as the third of the sects of the Jews, and defines their tenets thus: "They deny the existence of God (Josephus says 'Fate,' as he is speaking to pagans) and the Divine government of human affairs; and they assert that everything lies in our power, so that we are responsible for our good or bad fortune." Similarly, in the earlier history of the Jewish War (ii. 8, 14, §§ 164-166, Niese) to which he refers, he says: "The Sadducees, as the LXX and the succeeding Greek writers have told us, are a sect of unified individuals, their number is not large and their power is not great. They are united and set God beyond the possibility of punishing or supervising men. They assert that man is free to choose good or evil since both are set before him, and that he receives good or evil according to the choice he has made. With the soul they have realized the punishments and rewards of Hades. In contrast with the mutual friendliness and loyalty of the Pharisees, their behaviour towards one another is lacking in courtesy, and when they mix with the Gentile world their motto is, 'They are our countrymen and their fellows are aliens.'" Josephus might have added that they were disposed to treat aliens as they should have treated their friends.

In the New Testament there is already a tendency to ignore the Sadducees and to treat them, with the Pharisees, as the philosophical or religious opponents, and to advertise their denunciations addressed to hypocrites. The feud which set Pharisee and Sadducee against another one is ignored, and generally the confidion oblivion which overtook this sect of the Jews is mentioned. The Chrestophares was found by them with the Samaritans, and the confusion is natural enough.

The Sadducees were as little loyal to the Judaism of Jerusalem as the Samaritans—and they were less sincere and less interested in the one.

The Talmud reports ancient controversies on points of law; and gives the Sadducee a founder, Zadok the disciple of Antigonus the man of Soco who prohibited the hope of reward for service done to God. But this explanation of the name is as worthless as the rest of the Talmudic accounts of the Sadducees who were already dead and gone. For the present the explanation put forward by A. E. Cowley (Ency. Bib. 4236) holds the field: a Persian word Zendik meaning Zoroastrian, and therefore infixed in the mouths of those who did not hold with Zoroaster, was applied to them by their opponents, and gradually altered so as to mean something in Hebrew—i.e., Zadokite or Righteous. Its acquired significance could be derived from the inflexion of the voice or the suggestion of inverted commas.

Schürer (Geschichte des jüdischen Volkes, i., 4th ed., pp. 447-450, 475-480) gives the evidence of the ancient authorities and references to modern studies of the subject. See also Jews. (J. H. A. I.)

SADE, DONATIEN ALPHONSE FRANÇOIS, COUNT [usually called the MARQUIS DE SÄDE] (1740-1814), French licentious writer, was born in Paris on the 2nd of June 1740. He entered the light-horse at fourteen and was described as a military service before returning to Paris in 1766. Here his vicious practices became notorious, and in 1772 he was condemned to death at Aix for an unnatural offence, and for poisoning. He fled to Italy, but in 1777 he was arrested in Paris, removed to Aix for trial, and there found guilty. In 1798 he escaped from prison, but was soon re-arrested and finally committed to the Bastille. Here he began to write plays and obscene novels. In 1789 he was removed to the Charenton Lunatic Asylum, but was discharged in 1790, only to be re-committed as incurable in 1803. He died there on the 2nd of December 1814. Among his works, all of the type indicated, were Justine (1791), Juliette (1792), Philosophie dans le boudoir (1793) and Les Crimes de l'amour (1800). The word Sadism, meaning a form of sexual perversion, is derived from his name.

SÁ DE MIRANDA, FRANCISCO DE (1485-1558), Portuguese preacher of the order of Coimbra belonging to the ancient and noble family of Sá, and passed his early years by the banks of the river Mondego, the source of inspiration to poets in every age. He probably made his first studies of Greek, Latin and philosophy in one of the colleges of the Old City, and in 1505 went to Lisbon University, beginning at the same time to frequent
the court. Verse-making and gallantry occupied much of his time there, and by virtue of his talents and name he became one of the most prominent of the nobles and most celebrated poets of the age, including Bernadim Ribeiro and Christovão Falcão, who surrounded the beautiful and gifted D. Leonor de Mascarenhas. He seems to have resided for the most part in the capital down to 1521, dividing his time between the palace and the university, in the latter of which he had taken the degree of doctor of law by 1516. Honoured by the friendship of Prince John (afterwards John III.), he accompanied the court as it moved from place to place during the reign of King Manoel, and witnessed the triumphs of the Fortunate Monarch; and at a time when the flag of Portugal floated victorious in every sea and her ships encircled the globe, it was not surprising that the youthful poet should aspire to be the Virgil of a new Augustus ruling a universal monarchy. His studious and reflective mind and sound sense did not allow him, however, to nourish these illusions for long, and we find him pointing out in tones of prophetic melancholy the signs of decadence and future disaster.

He had come out of the university so good a lawyer that he was able to act as an independent professor of his faculty, and he was offered a judicial post, but his independent spirit and punctilious conscience led him to refuse it. He had only embarked on a legal career to please his father, and on the latter’s death he abandoned law for moral and stoic philosophy and poetry, and resolved to travel. He had observed with regret the modest intellectual position of his country, for all her wealth and epic achievements, the latter of which had found no echo in poetry; and if he were to learn and be able to introduce new forms of art fed by fresh ideals, as he desired, he felt he must go abroad. The Cancioneiro de Resende, which represented the poetical efforts of courtiers for almost a century and contained Miranda’s early verses, showed the extent of the national poverty by its artificiality, and lack of ideas, of sincerity and of good taste. These defects are not surprising, seeing that during most of that long period the literary movement had been confined to court circles and had remained essentially imitative of Spanish models, with hardly a vestige of national or popular inspiration about it. Portugal had been too busy building up a world-empire to imbibe much of the mental culture of the Renaissance, and even the classics were for the most part only known through Spanish translations. Direct intercourse between Portugal and Italy partook of a commercial rather than a literary or artistic character, and, previously to Miranda’s journey, Italian poetry was practically unknown.

In the middle of July 1520 he set out across Spain for Italy, and spent the years 1521 to 1525 abroad, visiting Milan, Venice, Florence, Rome, Naples and Sicily “with leisure and curiosity.” He enjoyed intimacy with Giovanni Rucellai, Lattanzio Tolomei and Sanazarro; he saluted the illustrious Vittoria Colonna, a distant connexion of his family, and in her house he probably talked with Bembo and Ariosto, and perhaps met Machiavelli and Guicciardini. He assisted at the rebirth of the Italian drama and saw the performance of classical prose comedies, a form of art which he was to transplant to Portugal. Last of the nobles who cultivated the art in Italy was his friend Bembo. He had recently worked upon the reform of Portuguese poetry, and he was, with horror the dissolution of morals which prepared the way for the Reformation.

Returning home in 1525, he brought with him the sonnet and odes of Petrarch, the tercet of Dante, the otava rima of Ariosto, the eclogue in the manner of Sanazarro, and Italian endecasyllabic verse. He did not, however, like his disciple Antonio Ferreira (q.v.), abandon the national redondilha, but rather continued to employ it and carried it to perfection in his Cartas. Settling down in Coimbra or its environs, he lived there from 1526-1527 until 1532. The visit of King John III. and his court to the city enabled him to resume his old relations with the reigning house and the cultivated members of the nobility, who received him affably and listened with interest to the story of his Italian tour. Gil Vicente, the court dramatist, was then at the height of his fame, but his autos appeared poor things to Sá de Miranda as compared with the comedies he had seen in Italy; and urged by his friends to present an example of the new style, he wrote the Estrangeiros. Produced in 1527-1528, it was the first Portuguese prose comedy, and was composed on the lines of the classical Roman drama as modified by contemporary Italian authors like Ariosto; it had a great and immediate success, notwithstanding the opposition of the partisans of the popular auto, who saw themselves attacked in the prologue. In 1528 Miranda made his first real attempt to introduce the new forms of verse by writing in Spanish a canzon entitled Fabula do Mondego, and in 1530-1532 he followed it up with the eclogue Aleixo, which among its redondillas has some endecasyllables—the earliest attempt at otava rima in Portuguese. Various sonnets dedicated to friends also belong to this period.

The foundations of the Italian school were now laid, and henceforth Miranda’s reputation as a poet grew visibly, while he was also one of the most esteemed of courtiers; but the opposition of his literary foes increased with his very success. Moreover, in the sphere of politics pessimism had taken firm hold of him. From being a land of promise, India had become for him, as for Camoens, “the mother of villains, the stepmother of men of honour”; and though the wealth of the East poured into Lisbon, Portugal remained poor because agriculture was neglected and corn had to be imported from abroad. Miranda is credited in vigorous terms against the fever of adventure and lust of gold, but few gave ear to his moralizing, or had leisure to read poetry, and in 1534 he left the court.

The year 1532 had marked his passage from the active to the contemplative life, and the eclogue Basto, in the form of a pastoral dialogue written in redondillas, opened his new manner. It has a pronounced personal note, and its episodes are described in a genuinely popular tone. The shepherds Gil and Bento represent, the one city sociability, the other rustic aloofness, or the contrast between life at court and in the country, and serve as a vehicle for the poet’s ideas. The same epoch saw the composition of his Cartas or sententious letters in quinilhas, which, with Basto and his satires, make up the most original, if not the most valuable, portion of his legacy, and served as models for two centuries. His allusion in Aleixo to the exile of Bernardim Ribeiro, and his defence of his friend, seem to have offended that powerful grandee, the court of Castanheira, and probably hastened his retirement from court, and the royal gift of a Comenda of the Order of Christ, situate by the river Neiva on the borders of Galicia, came opportune, because the rents Sá de Miranda drew from it and a small private fortune enabled him to live in modest comfort at the neighbouring Quinta da Tapada. Poetry with him was never a mere pastime, and, after a short period of repose, the gift of a MS. of the verses of Garciaإسلام and Boscan, founders of the Italian school in Castille, encouraged him to resume the work of reform commenced at Coimbra; between 1535 and 1538 he composed five eclogues in endecasyllables, four in Spanish and one in Portuguese, which show evident traces of their influence.

Before long he heard echoes of his new song, first from the province, then from the court. In 1536 he married D. Briolanja de Azevedo, a lady of rare qualities and education, belonging to an illustrious branch of the Almaviva family. He devoted the rest of his life in retirement at the Quinta da Tapada, which he bought, centre of literature with which the reform of Portuguese poetry spread; for he developed great poetical activity in his retreat, and while he read and annotated Homer in the original Greek, he did not disdain domestic pleasures and country sports. His evenings were occupied by music and the performance of comedies and mimes, and by readings of Bembo and Ariosto with cultivated neighbours; and he extended hospitality to savants like Nicholas Cleynants and Francisco de Hollanda, and launched on the career of letters such men as Diogo Bernardes, the author of the Lima.

In 1538 he wrote his second classical prose comedy, the Vilhampãos, which was played before the Cardinal Infant Henry, afterwards king, at his request, and on the poet’s death that prince saw to the printing of this and the earlier comedy. During the years 1543 to 1555, except for a few occasional poems Sá de Miranda kept silence, and the cause is not far to seek; the Inquisition had got to work, and the Jesuits had acquiesced control of the university and displaced the humanists.
the king and court lent their presence to outos do fe and organized public penances, initiating a reign of fanaticisms and sadness, there was no place for poetry. Sâ de Miranda could only deplore in private the misfortunes of his country and devote himself to polishing his verses and educating his children. His life's work was lost, for the year 1550 saw Camoes writing his admirable sonnets, canzonets, elegies, and the Italian school had definitely triumphed. The last eight years of Sâ de Miranda's life produced a cycle of beautiful poems evoked by the personality of Prince John, the heir-apparent, who loved letters and especially poetry, and whose precocity of talent made him the hope of all patriots. In 1550 and 1551, after the prince's visit to the university of Coimbra, he honoured the master by asking for a collection of his poems, and on three occasions we find the latter despatching portions of his song-book to Lisbon accompanied by dedicatory sonnets. Moreover, he had the further gratification of receiving verses from Antonio Ferreira, Jorge de Montemayor, Diogo Falcão de Resende, which were so many revelations of the vitality of his school. Three misfortunes, however, came on him in quick succession. He lost his eldest son in 1553, Prince John died in 1554, and in 1555 his wife died. His friend King John III. passed away in 1557, and on the 13th of March 1558 Sâ de Miranda followed him to the grave.

He was not a great writer and never entered into the hearts of his countrymen, remaining the poet of the cultured, who could understand his song in a court sequestered in its own imperfections. He was a poet for himself, for posterity, for the present. He did not care for the way, however, in a revolution in literature which specially in poetry, which under his influence became higher in aim, purer in tone and broader in sympathy. He is obviously not at ease in the new forms which he had introduced, and his verse is, as a rule, austere, unharmonious and often difficult of understanding, but these remarks do not, of course, apply to his rondelhas. Some of his sonnets are, however, admirable, and display a grave tenderness of feeling, a refinement of thought, and a simplicity of expression which give them a high value. As examples it is only necessary to mention the one beginning “ O sol fe grande...”, and the lines he composed on the death of his wife. Sâ de Miranda wrote much and successfully in Castilian, several of his best eclogues being in that language. This charm of these compositions lies in their convincing descriptions of natural scenery and country life, which he loved and comprehended to perfection. Sâ de Miranda's works were not published in full until 1584, and an admirable critical edition of Madame Manoel's De Vasconcellos (Halle, 1885), containing life, notes and glossary, supersedes all others so far as the poems are concerned. His plays can be read with profit from the edition of the collected works (1868). A critical edition is available. See also Oswald Crawford, Portugal Old and New (London, 1886); Dr Sousa Viterbo, Estudos sobre Sá de Miranda (3 parts, Coimbra, 1895-1896); Decio Carneiro, Sá de Miranda entre os seus obra (Lisbon, 1896); and Dr Theophile Braga, Sá de Miranda (Orpoto, 1904). (E. Pr.)

SADHU, a Hindu ascetic, corresponding to the Mahomedan fakir (q.v.). The Sadhus, who are known also as Sanyasis, Gosains and Bairags, are of various sects, hold peculiar opinions, indulge in strange practices, and subject themselves in many cases to cruel hardships and fantastic disciplines. They range in moral standing from the perpetually squandering philosopher to the idle vagabond. Some lead the life of contemplation, which Hindus consider especially holy; others pose as alchemists, physicans, fortune-tellers, palmtists or acrobats; while others yet again practise voluntary tortures, such as holding one arm upright until it withers, or lying continually upon a bed of spikes. Some go about almost naked, smeared all over with ashes; but the usual garment of an ascetic is stained an orange red with ochre. Hence was derived the colour of the Mahatta flag. Also, Hindus their dead are buried instead of being burned, usually in a sitting posture, and often in salt. During the disturbed period of Indian history, before British rule was firmly established, armed bodies of Sanyasis or Gosains attached themselves to the Mahatta armies, and also ravaged Northern Bengal in the time of Warren Hastings.

SA'DI (c. 1184-1292). MUSSLIH-UDDON, or more correctly MUSHARIF-UDDON. MUSSLIH-UDDON, the greatest didactic poet and the most popular writer of Persia, was born about 1184 (A.H. 580) in Shiraz. After the premature death of his father he was taken under the protection of Sa'd b. Zengi, the atâbeg of Fars, who sent him to pursue his studies in the famous medressê of Baghdâd, the Nizâmiyâh, where he remained about thirty years (1196-1224). About 1210 (A.H. 606) his literary fame had spread so far as Kashgar in Turkestan, which the young poet (who in honour of his patron had assumed the name of Sa'di) visited in his twenty-sixth or twenty-seventh year. After mastering all the dogmatic disciplines of the Islamic faith he turned his attention first to practical philosophy, and later on to the more ideal tenets of Sufic pantheism, under the spiritual guidance of the famous sheikh Shihâb-uddon Umar Suhrawardî (died 1234; A.H. 632). Between 1220 and 1225 he paid a visit to a friend in Isfahan, went from there to Damascus, and returned to Isfahan just at the time of the inroads of the Mongols, when the atâbeg Sa'd had been deposed by the victorious Khwarizm ruler of Gillyâss-uddon (1226). Sadly grieved by the misfortune of his patron and disgusted with the miserable condition of Persia, Sa'di quitted Shiraz and entered upon the second period of his life—that of his wanderings (1226-1236). He proceeded via Bâlk, Ghazni and the Punjab to Gujrat, on the western coast of which he visited the famous shrine of Siv in Somnath. After a prolonged stay in Delhi, where he learnt Hindûstânî, he sailed for Yemen. Overcome with grief at the loss of a beloved child (when he had married is not known), he undertook an expedition into Abyssinia and a pilgrimage to Mecca and Medina. Thence he directed his steps towards Syria and lived as a renowned sheikh for a considerable time in Damascus, which he had once already visited. There and in Bâilek he added to his literary renown that of a first-rate pulpit orator. Specimens of his spiritual address, are preserved in the five homilies (on the fugitive life, on faith and fear of God, on love towards God, on rest in God and on the search for God). At last, weary of Damascus, he withdrew into the desert near Jerusalem and led a solitary wandering life, till one day he was taken captive by a troop of Frankish soldiers, brought to Tripoli, and condemned to forced labour in the trenches of the fortress. After enduring countless hardships, he was eventually rescued by a rich friend in Aleppo, who paid his ransom, and gave him his daughter in marriage. But Sa'di, unable to live with his quarrrelsome wife, set out on fresh travels, first to North Africa and then through the length and breadth of Asia Minor and the adjoining countries. Not until he had passed his seventyth year did he return to Shiraz (about 1285; A.H. 653). Finding the place of his birth tranquil and prosperous under the wise rule of Abâhâk, Sa'di, the son of his old patron (1226-1226; A.H. 623-628), the aged poet took up his permanent abode, interrupted only by repeated pilgrimages to Mecca, and devoted the remainder of his life to Sufic contemplation and poetical composition. He died at Shiraz in 1292 (A.H. 691) according to Hamdallah Mustauffi (who wrote only forty years later), or in December 1291 (A.H. 690), at the age of 110 lunar years. The experience of the world gained during his travels, his intimate acquaintance with the various countries he had visited; his insight into human character, together with an inborn loftiness of thought and the purest moral standard, made it easy for Sa'di to compose in the short space of three years his two masterpieces, which have immortalized his name, the Bâstân or " Fruit-garden " (1257) and the Gulistan or " Rose-garden " (1258), both dedicated to the reigning atâbeg Abû Bekr. The former, also called Sa'dânamâ, is a kind of didactic epopee in ten chapters and double-thumbed verses, which passes in review the highest subjects in the light of popular and religious questions, not seldom in the very spirit of Christianity, and abounds with sound ethical maxims and matchless gems of transcendental speculation. The latter is a prose work of a similar tendency in eight chapters, interspersed with numerous verses and illustrated, like the Bâstân, by a rich store of clever tales and charming anecdotes; it discusses more or less the same topics as the larger work, but has acquired a much greater popularity in both the East and the West, owing to its easier and more varied style, its attractive...
SADIYA—SADLER, SIR R.

lessons of practical wisdom, and its numerous bons mots. But sa'di's Dower, or collection of lyrical poetry, far surpasses the Bskait and Guizidan, at any rate in quantity, whether in quality also is a matter of taste. Other minor works are the Arabic gusidas, the first of which laments the destruction of the Arabian caliphate by the Mongols in 1258 (A.H. 656); the Persian gusidas, partly panegyric, partly didactic; the maratkhi, or elegies, beginning with one on the death of Abu Bekr and ending with one on the defeat and demise of the last caliph, Mosta'sim; the mulamma'd, or poems with alternate Persian and Arabic verses, of a rather artificial character; the tarij'i, or refrain-poems; the qasids, or odes; the shahbiyah and mukada't, or moral aphorisms and epigrams; the rub'u'iyah, or quatrains; and the mufaddah, or distichs. Sa'di's lyrical poems possess neither the easy grace and melodious charm of Hafiz's songs nor the overpowering grandeur of Jelad-din Rumi's divine hymns, but they are nevertheless full of deep pathos and show such a fearless love of truth as is seldom met with in Eastern poetry. Even his panegyrics, although addressed in turn to almost all the rulers who in those days of continually changing dynasties presided over the fate of Persia, are free from that cringing servility so common in the effusions of Oriental eunuchs.

The first who collected and arranged his works was 'Ali b. Ahmad b. Bisutun (1326-1334; A.H. 726-734). The most exact information about Sa'di's life is preserved in four important introductions to the Persian text. Bacher's Sa'di's Aphorismen und Sinnsedichte (Strassburg, 1879: a complete metrical translation of the epigrammatic poems), and in the same author's "Sa'di Studien," in Zeitschrift der morgenländischen Gesellschaft, xxxiv, pp. 51-106; see also H. Ebel in W. Geiger's Grundriss der iranischen Philologie, ii, pp. 292-296, with full bibliography; and E. G. Browne, Literary History of Persia, pp. 825-830. Sa'di's Kalyûydi or collective works have been edited by W. Geiger (Calcutta, 1791-1798) (with an introduction and a prose translation by H. W. Clarke (London, 1879); and Ziauddin Gulam Moheiddin (Bombay, 1889); verse by G. S. Davie (1882); French translation by Barbier de Meynard (Paris, 1880). The best editions of the Guizidan are by A. Sprenger (Calcutta, 1815) and by Platt's (London, 1874); the best translations into English by Eastwick (1852) and by Platt's (1873), the first four books in prose and verse by S. H. Arnold (1869); into French by Defermény (1891); into German by Graf (1899); and into English by Poetry for English Readers (1883), pp. 245-366. The Pandumbôk, or book of wisdom (of doubtful genuineness) has been translated by A. N. Wollaston (1908), with Persian text. Select qasids, ghazals, elegies, and epigrams have been selected and translated by E. Reiss in a metrical translation, by Graf, in the Z. M. D. M. G., p. 92 sq., p. 82 sq., xii. p. 445 sq., xvi. p. 541 sq. and xviii. p. 579 sq. On the *Sûne* character of Sa'di in contrast to Hafiz and Rumi, consult E. H. Ebel's "Briefe aus Morgenlande:he Studien" (Leipzig, 1870), pp. 95-124. (H.E.)

SADIYA, the extreme north-east frontier station of British India, in the Lakhimpur district of Eastern Bengal and Assam. It stands high on a grassy plain, nearly surrounded by forested-clay mountains, on the right bank of what is locally (but erroneously) considered the main stream of the Brahmaputra. On the opposite bank a railway has recently been opened which connects with the Assam-Bengal line. Sadiya is garrisoned by detachments of native infantry and military police, and is the base of a chain of outposts. There is a bazaar, to which the hillmen beyond the frontier—Mishmals, Abors and Khamtis—bring down rubber, wax, ivory and musk, to barter for cotton-cloth, salt, metal goods, &c.

SADLER, MICHAEL THOMAS (1780-1835), English social reformer and economist, was born at Snelsed, Derbyshire, on the 3rd of January 1780. Settling down in business in Leeds in 1800, he early took an active part in public life, devoting himself particularly to the administration of the poor law. In 1828 he wrote Ireland: its Evils and their Remedies, in which he advocated a poor-law, and a tax on absenteeism. He also took a share in the Malthusian controversy, writing The Law of Population: a Treatise in Disproof of the Super-fecundity of Human Beings and developing the Real Principle of their Increase (1830). He entered parliament in 1829 as member for Newark, and devoted his efforts to questions of social reform. He took a leading part in the agitation for the prevention of child labour in factories—he was chairman of the committee appointed to inquire into the subject. He contested Leed after the Reform Bill of 1832 (Aldborough, for which he had sat after Newark, being deprived of its member), but was defeated by Macaulay. In 1854 he was unsuccessful at Huddersfield, and failing health prevented any further attempts to re-enter parliament. He settled down in Belfast, where his firm had business interests, and died at New Lodge on the 29th of July 1855.

See R. B. Seeley, Memoirs of M. T. Sadler (1842).

SADLER (or SADLER), SIR RALPH (1557-1587), English statesman, the son of Henry Sadler, steward of the manor of Cliny, near Great Hadham, Hertfordshire, was born at Hackney, Middx., in 1557. While a child he was placed in the family of Thomas Cromwell, afterwards earl of Essex, whose secretary he eventually became. Between 1525 and 1529 his patron's letters are full of Sadler's name in connexion with Cardinal Wolsey's suppression of the monasteries; this probably brought him under the king's notice, for in 1536 he was made gentleman of the privy chamber, and from that time was continually employed by Henry VIII. In 1537 Sadler went first to Scotland to try to reconcile Margaret to her son James V., and then to France on the same mission to James himself. He seems to have been successful, and was again in Scotland in 1540 trying to induce the king to follow his uncle's ecclesiastical policy. In or about January 1540, he was made secretary of state along with Sir Thomas Wriothesly, and was knighted, probably about the same time. On James V.'s death Sadler again went to Scotland (March 1543) to negotiate a marriage between prince Edward and his cousin Mary; he was unsuccessful, but still retained Henry's confidence. On Henry's death in 1547, Sadler was by his will made one of the councillors to the sixteen noblemen entrusted with the young king's guardianship. In the same year he was appointed treasurer to the army sent to Scotland, and for his services in rallying the repulsed cavalry at the battle of Musselburgh or Pinkie, he was created a knight-beggar. He also received many grants of land, including the manor of Standon in Hertfordshire, where he built a magnificent house in 1546. When Mary ascended the throne he retired, living quietly till Elizabeth's accession. He issued the writs for the new parliament meeting in Hertford. In 1554 he was created Baronet, and during the last 4 years of the queen's reign he once more became a privy councillor. He sat in the parliament of January 1558-1559 as member for Hertford, which he had already represented in 1541, 1542 and 1553. Not long afterwards his strong Protestant sympathies and his acquaintance with Scotch affairs induced Elizabeth to send him (1559) to Scotland, ostensibly to settle the border disputes, but in reality to secure a union with the Protestant party there, and he was largely instrumental in bringing about the treaty of Leith, July 6th, 1560. In 1568 Sadler was appointed chancellor of the duchy of Lancaster, and in the same year was one of the English Commissioners employed in treating on the matters arising from the flight of the Queen of Scots. From this time he seems to have been continually engaged as a discreet and trusty servant in connexion with Mary's captivity, and was frequently sent with messages to her. On the 25th of August 1584, when, owing to the imputations made by his countess, George 6th earl of Shrewsbury was allowed to resign his guardianship of the Queen, Sadler was appointed to succeed him. In September Mary was removed from Sheffield to Wingfield and thence early in 1585 to Tutbury. In April, Sadler, after numerous petitions on his part, was permitted to resign his distasteful charge. He is said by some to have been sent to Scotland to announce to James VI. his mother's death, but this is not corroborated by the state papers. On the 30th of March 1587 Sadler died at Standon, and was buried in the church there. He had married about 1534 Elizabeth Mitchell,
whose first husband Matthew Barre had deserted her and was believed to be dead. Barre, however, re-appeared a few years later, and Sadler then obtained an act of parliament legitimizing his children. Sadler was not a brilliant statesman, but a most faithful and intelligent servant. His letters, particularly those on Scottish affairs, are most interesting.

**SAĐO,** an island belonging to Japan, lying 32 m. W. of Niigata, on 38° N., 138° 30' E. It has a circumference of 130 m., an area of 336 sq. m. and a population of 113,000. The port is Ebise, on the east coast; and at a distance of 16½ m., near the west coast, is the town of Aikawa, having in its vicinity gold and silver mines, for which Sado is famous. They have been worked from very early times. Sado consists of two parallel hill ranges separated by a lower isthmus; the loftiest peak is that of Kimpokukan (3815 ft.), to the north of Aikawa.

**SAĐOLETO, JACOPO** (1477-1547), Italian humanist and churchman, was born at Modena in 1477, and, being the son of a noted jurist, was designed for the same profession. He gave himself, therefore, to humanistic studies and acquired reputation as a Latin poet, his best-known piece being one on the group of Laocoon. Passing to Rome, he obtained the patronage of Cardinal Cajetan and adopted the ecclesiastical career—Leo X. chose him as his secretary along with Pietro Bembo, and in 1517 made him bishop of Carpentras. Sadoleto had a remarkable talent for affairs and approved himself a faithful servant of the papacy in many difficult negotiations under successive popes, especially as a peacemaker; but he was no bigoted advocate of papal authority, and the great aim of his life was to win back the Protestants by peaceful persuasion—he would never countenance persecution—and by putting Catholic doctrine in a conciliatory form. Indeed his chief work, a *Commentary on Romans,* though meant as a prophylactic against the new doctrines, gave great offence at Rome and Paris. Sadoleto was a diligent and devoted bishop and left his diocese with reluctance even after he was made cardinal (1536). His pietistic and tolerant spirit, combined with his reputation for scholarship and eloquence and his diplomatic abilities, give him a unique place among the churchmen of his time. He died in 1547.

His collected works appeared at Mainz in 1607, and include, besides his theologico-irresolute pieces, a collection of Epistles, a treatise on education (first published in 1533), and the *Phaedrus,* a defence of philosophy, written in 1538. The best collection is that published at Venice in 1570. In 1528 a Latin translation was made by J. J. Bähr, and in 1550 his works were published in Venice by his personal assistant, a man named Péricau. Fragmenti biographici su Jacob Sadoleto (Lyons, 1849); J. J. Bähr, De Jacob Sadoleto (Cleve, 1857); Balan, Monumenta, vol. i. (Innsbruck, 1885); Rohchi’s edition of the letters (Modena, 1872).

**SAĐOLIN, JÖRGEN** (c. 1490-1559) Danish reformer, the son of Jøs Christensen, a curate and subsequently a canon of Viborg cathedral, and consequently, in all probability, born (c. 1490) out of wedlock, as his Catholic opponents frequently took care to remind him. He himself never used the name Sadolinus, which seems to have been invented subsequently by his son Hans, and points to the fact that the family were originally saddle-makers. We first hear of him on the 1st of December 1525, when Frederick I., permitted him to settle at Viborg to teach young persons of the poorer classes "whatever might be profitable." On this occasion he is described as "magister" and no doubt got his degree abroad, where he seems to have been won for the Reformation. He sided with Hans Tausen when the latter first began to preach the gospel at Viborg, and Tausen, though himself only in priest’s orders, shortly before he left the place, ordained Sadolin (1529). Amongst the first priests who attended the *keredag* of Copenhagen in 1530 Sadolin occupied a prominent place. Frederick subsequently transferred him to Funen, where he acted, according to his own expression, as "adjudor in verbo" to Knud Gyldenstjerne, bishop of Odense. At the diocesan council held on the 27th of May 1532, during the absence of the bishop, he presented to the assembled priests a translation of Luther’s catechism, with Luther’s name omitted, preceded by an earnest plea in favour of a better system of education and a more practical application of the Christian life, which occupies a conspicuous place in the literature of the Danish Reformation. In the following year Sadolin published the first Danish translation of the Confession of Augsburg. He disappears during the troubous times of "C-revns Fejde" (1533-1536), though we get a glimpse of him at the end of 1536 as one of the preachers at Vor Frue Kirke, the principal church of Copenhagen. On the 2nd of September 1537 he was consecrated by the German reformer, Johann Bugenhagen, who himself only had priest’s orders, superintendent, or first evangelical bishop, of Funen. As bishop he was remarkable for his success with which he provided the necessary means for the support of churches, schools and hospitals in his widespread diocese, which had been deprived of its usual sources of income by the wholesale confiscation of church property. Towards the Catholics he adopted a firm, but moderate and reasonable, tone, and his indulgence towards the monks in St Knud’s cloister drove down upon him a fierce attack from the Puritan clergyman of Odense, who absurdly accused him of being a crypto-Catholic. He gave the funeral oration over Christian III. in St John’s Church at Odense in February 1559, though now very infirm and blind, and died at the end of the same year.

See Bücke, *Dansk Biografisk Læs. Sadolin* (Copenhagen, 1887).

**SADÓWA** (Czech, Sadová), a village of Bohemia, Austria, 4 m. N.W. of Königgrätz. Pop. (1900) 183, exclusively Czech. Sadowa, with the small adjoining wood, was one of the principal and most hotly contested Prussian positions in the decisive battle now usually called by the name of Königgrätz (see Seven Weeks War).

**SAŘIPINUM** (mod. Attilia, near Sepino), a Samnite town 9 m. S. of the modern Campobasso, on the ancient road from Beneventum to Corfinium. It was captured by the Romans in 293 B.C. The position of the original town is on the mountain far above the Roman town, and remains of its walls in Cyclopean masonry still exist. The city walls (in opus reticulatum) of the Roman town were erected by Tiberius before he became emperor, the date (between 2 B.C. and A.D. 4) being given by an inscription. Within them are remains of a theatre and other buildings, including temples of Jupiter and Apollo, and there still exists, by the gate leading to Boavianum, an important inscription of A.D. 108, relating to the *triautra* (see APSULON in Roman days, forbidding the natives to harm the shepherds who passed along them (*Corr. inscr. Lat. ix. 2438*).

See L. Fulvio in *Not. degli scavi* (1878), 374.

**SAETERSDAL,** a district in the south of Norway, comprising the valleys of the Otter rivers and its tributaries. The river rises in the fields above the Bukken Fjord, and flows south to Christiansund. The natives preserve old customs and an individual costume. A railway follows the valley to Byglands Fjord (48 m.), on the lake of that name, fostering the local agricultural and timber trade, and a driving road continues to Viken i Valle from which bridle-paths lead to Dalen in Telemarken, and over the Enden and Malen fjeles to Lake Suldals on the Bratlandsdal route.

**SAFED KOH** ("white mountain"), in many respects the most remarkable range of mountains on the north-west frontier of India, extending like a 14,000 ft. wall, straight and rigid, towering above all surrounding hills, from the mass of mountains which overlook Kabul on the south-east to the frontiers of India, and preserving a strike which—being more or less perpendicular to the border line—is in strange contrast to the usual conformation of frontier ridge and valley. The highest peak, Sikaram, is 15,620 ft. above sea-level, and yet it is not a conspicuous point on this unusually straight-backed range. Geographically the Safed Koh is not an isolated range, for there is no break in the continuity of water divide which connects it
with the great Shandur offshoot of the Hindu Kush except
the narrow trough of the Kabul river, which cuts a deep waterway
across where it makes its way from Dakka into the Peshawar
plains. Strategically it is an important topographical feature,
for it divides the basin of the Kabul river and the Khyber route
from the valley of Kurrum, leaving no practicable pass across
its rugged crest to connect the two. Its western slopes, where
it abuts on the mountain masses which dominate the Kabul
plain, are forest-covered and picturesque, with deep glens inter-
secting them, and bold craggy ridges; the same may be said
of the northern spurs which reach downward through the
Shinwari country towards Gandamak and Jalalabad. Here
the snow lies late and moisture is abundant—but on the southern
sun-scorched cliffs but little vegetation is to be seen. Approaching
the Peshawar plains the Safed Koh throws off long spurs east-
ward, and amongst the foothills of these eastern spurs the
Afidi Tirah long remained hidden from European eyes.

**SAFES, STRONG-ROOMS AND VAULTS.** The term "safe,"
whilst really including any receptacle for the secure custody of
valuables provided with a lock or other device intended to
prevent any person except the owner or some person authorized
by him gaining access thereto, has gradually come to be confined
to such receptacles when fitted with a vertical door, as distin-
guished from a lid, and of such a size that they can be moved
into position, by the use of proper appliances, in one piece. Such
receptacles, when so large as to require that their parts should be
assembled *in situ*, fall under the term "strong-rooms," or in
the case of safe-deposits "vaults," and when constructed with
hinged lids, as distinct from doors, under the terms "cash-box,"
"deed-box" and "coffer." The term "coffer" is probably the
most ancient, and in earlier days included, as it still does in
France, what are now known as safes.

Although it is practically certain that boxes provided with locks
or coffers must have followed closely on the development of locks
(q.v.) and been in use in ancient Egypt, yet no examples remain
to us of earlier date than the middle ages. The earliest examples
extant were constructed of hard wood banded with hammering
iron, and subsequent development took place rather on artistic
than on practical lines up to the time of the introduction
of boxes entirely of iron. On the continent of Europe the iron box
was developed to a very high standard of artistic beauty and
craftsmanship, but with no real increase of security. Several
specimens of these coffers supposed to be of 17th-century work-
manship are preserved in the museum at Marlborough House.
Cast-iron chests seem to have been made in various parts
of Great Britain in the early part of the 19th century, but the use
of wrought iron was probably confined to London until 1820,
or thereabouts, when the trade spread to Wolverhampton.

Up to this time no attempt had been made to make coffers
fireproof, for though a patent for fireproofing had been taken out
in 1807 by Richard Scott, it does not appear to have been used.
In 1834, however, a patent was obtained by William Marr
for the application of non-conducting linings, followed about four
years later by a similar patent in the name of Charles Chubb.
The foundation, however, of the modern safe industry was laid
by Thomas Milner, originally a tinsmith of Sheffield, who after
a few years' business in Manchester established, in 1830, works
at Liverpool for the manufacture of tinplate and sheet iron boxes
and who later made plate iron chests or coffers and, probably
the earliest, safes about the year 1836. To him is due the modern
system of fireproofing, which owes its merit to the use not of
non-conductors but of an absorbent material which in the case
of fire will be permeated with moisture present in it, either in the
form of liquid contained in tubes which burst or otherwise
discharge their contents when subjected to heat, or mixed with it
as water of crystallization in combination with an inorganic salt.
The patent he obtained in 1840 contains the following claim:
"Constructing, forming, or manufacturing boxes, safes, or other
depositories of an outer case of iron or other metal or material,
closing one, two, or more inner cases, with spaces or chambers
between them, containing an absorbent material or composition,
such as porous wood, dust of wood, dust of bones, or similar
substances, in which are distributed vessels, pipes or tubes
filled with an alkaline solution or any other liquid or matter
evolving steam or moisture, the tubes or vessels bursting or
otherwise discharging themselves on the exposure of the box or
other depository to heat or fire, into the surrounding absorbent
matter, which thus pervaded with moisture and rendered difficult
of destruction, protects the inner cases or boxes and their
contents." In 1843, Edward Tann, Edward Tann, Junr.,
and John Tann took out a patent for securing the presence of moisture
by means of a chemical salt. In their patent they give preference
to alum in combination with Austin's cement or gysum, but they
also claim "any non-conductors of heat may be used, and
for alum may be substituted sulphate of potash, muriate of
ammonia, borax, impure potash, nitrate of soda, soda in cake,
pearlash, or any of the known alcalis." Milner considered this
an infringement of his patent of 1840, and in an action before
Lord Campbell and a special jury in the Queen's Bench, on the
3rd of June 1851, a verdict was given upholding his contention.

For some years no marked improvements in safes were made,
although the manufacture had been taken up in various places
by different firms. Safes had, however, been constructed of
thicker materials, and some attention had been paid to the more
secure attachment of the various parts; also, with the advent

![Fig. 1.](image-url)
SAFES, STRONG-ROOMS AND VAULTS

In the early days of the safe industry in America the conditions as far as protection from fire was concerned were entirely different from those obtaining in Great Britain. The timber construction employed in American buildings rendered fires much more fierce, but at the same time of very short duration, not more than an hour or two. To meet this condition of affairs thick sides of non-conducting materials were more efficacious than the chambers of steam-generating materials employed in British construction, but the gradual abandonment of timber and the increasing size of buildings have called for changes in the methods of fire-proofing.

The American "burglar proof" safe (fig. 4) seems to have developed from the fire-proof (fig. 5) simply by the addition of extra thicknesses of metal, usually alternately hard and soft, without any serious increase of structural strength; this construction, known as the "laminated" or "built up," offers little resistance to burglars, as the various layers can be separated from one another by the use either of explosives, especially nitroglycerine, or of wedges. In 1890 a commission was appointed by the U.S.A. government to report upon the strong-rooms or vaults of the treasury at Washington; and their report was presented in September 1893. This commission based their conclusions on experiments conducted in their presence, as well as on well-authenticated experiments performed by safe-makers on their own and other makers' productions, and they found that, with the single exception of the Corliss safe, all the safes which came under their notice—and these comprised all the best-known American makes—could be opened by burglars by

In America, in 1860-1870, perhaps the most important in the history of safes, that the opening of safes by wedges seems to have become prominent. The effect of wedges was to bend out the side of the safe sufficiently to allow of the insertion of a crowbar between the body and the edge of the door, and various devices were adopted by different makers with the object of resisting this mode of attack. These devices may be placed in three classes: (1) the fixing to the door of studs or projections which, when the door closed, passed into holes or recesses in the frame of the body; (2) the use of bolts hooking into the side framing or entering the bolt holes at an angle; (3) the strengthening of the side framing and of the attachment of the bolts to the outer door-plate. The third of these methods (fig. 2) was patented by Samuel Chatwood in 1862, and is still very commonly employed. The second method was used by Chubb and Chatwood, but is not to-day in general use. The first method was used by all makers of repute, but has now been abandoned, as the increased structural strength of the better class of safes renders such devices unnecessary.

To prevent safes from being opened by the drilling of one or two small holes in such positions as to destroy the security of the lock itself, advantage was taken of the improvements in the manufacture of high carbon steel, and even in what is to-day called the "fire-proof" safe a plate of steel which offers considerable resistance to drilling is placed between the outer door plate and the lock.

For many years little advance was made except such as consisted in substituting steel for iron and in general gaining increased strength by the utilization of better materials, although many safes are made and sold to-day which offer little if any more resistance to fire and thieves than those of 1860-1870. About 1888 the "solid" safe was introduced. In this the top, bottom and two sides of the safe, together with the flanges at the back only or at both back and front, are bent from a single steel plate (fig. 3). This construction, with solid corners, also illustrated in figs. 1 and 2, only became practicable in consequence of the great improvements which had been made in the quality of steel plates; the credit of its invention formed the subject of litigation, which, however, was not carried to an issue. The abolition of corner joints, which up to 1888 had been made by dovetailing and by the use of angle irons, had been previously attempted by welding, but the process was abandoned as commercially impracticable.
drilling, by the use of explosives, and by the use of wedges and similar well-known tools. This Corliss safe consists of a spherical shell of cast iron several inches thick and with its exterior hardened by “chilling.” It is fitted with a ground-in door rotating concentrically with the shell and internally. The spherical form and great thickness render the useful space in the interior very small and of inconvenient shape.

The requirements of a modern safe may be briefly summarized.

In fire- and thief-proof safes, the body and door must be constructed of sufficient thickness, and the joints as well as the attachment of the door to the body frame of sufficient strength, to remain uninjured by a fall from the highest position in which the safe may be placed to the basement, or by the impact of any debris, coping stones, girders, etc., falling from the highest part of the building to the basement. The space between the outer body and the inner casing must be properly charged with a steam-generating mixture in sufficient quantity to keep the interior of the safe moist for the whole time during which it may be subjected to heat in the case of a fire. The same requirements must be satisfied in burglar-proof safes. In addition, the body and door must be of such material and of such thickness that it is impossible to cut a sufficiently large hole to extract the contents, and so constructed that they cannot be dismembered; the framing and attachment of the bolts to the door must be able to resist the action of wedges or forcing screws; the vital parts of the lock and boltwork must be further protected so that it is impossible to attack them by drilling, and this protection must not be liable to be destroyed by the action of heat; the lock itself must not be capable of having its security destroyed by the explosion of the largest quantity of explosive which can be inserted. If these conditions are satisfied there is little fear that the oxy-acetylene blowpipe, the electric arc or the use of the higher explosives can be made effective. The amount of protection required to meet the above conditions must, in each case, depend on what tools it is reasonable to anticipate may be employed by the burglar and the maximum time which he may have at his disposal. The use of high explosives has become a more frequent method of attack by burglars in Great Britain, but where the safes have been of the best quality, of solid construction and good workmanship, this means of attack has been rendered ineffective.

Strong-rooms and Vaults.—It is not hard to imagine that the use of strong-rooms was much earlier than that of safes; in fact, there can be no doubt that masonry rooms provided with heavy wooden doors secured by locks were in use in ancient Egypt, and that the development of modern strong-rooms is a direct result of these. It is to be observed that the well known method of inserting a section of the old door of a strong-room into a new one is in common use.

Strong-rooms of this construction are in common use to-day by banks and other institutions; and, as with safes, so with strong-rooms, development has taken place in the direction of increasing the thickness and the structural strength as well as in the application of superior locking devices (see Locks).

This increase of structural strength has been carried along somewhat different lines by different makers in Great Britain and along still more diverse lines in America. Masonry or brickwork alone is now rarely relied on for the protection of goods of any great value; concrete, however, reinforced by old railway metals imbedded therein and sometimes connected together to form, as it were, a cage, is in use. Railway metals attached to steel plates and also bedded in concrete are very largely employed. Thick plates of steel and latterly of manganese and other special steels are also in common use. Various forms of strong-room walls are illustrated in fig. 6.

Usually a strong-room is provided with an open-work gate or
The safety of the Davy lamp is endangered by exposure to a current of gas moving at more than 6 ft. a second, as the flame is then liable to be forced through the gauze, and the Clanny and Stephenson lamps are not safe in currents exceeding 8 and 10 ft. These limits, however, are considerably increased if the lamps are properly assembled and modified to meet the requirements of safety in air-currents travelling at a high velocity. In the Hepplewhite-Gray lamp there is a conical glass surrounding the light, with a gauze chimney, protected by a outer cylinder; the safety lamp, which is the ordinary Davy lamp, is carried downwards through three tubes forming the standards of the cage. This lamp, in addition to giving a good light overhead owing to the shape of the glass, is peculiarly sensitive to gas, and requires to be protected by a gauze chimney. These lamps are the Deflector and those of Marsaut and Mueseuler when specially bonneted to resist extra high-speed currents. The illuminant now generally used in Great Britain is a mixture of rape oil with half its volume or more of petroleum, which is more suitable than vegetable oil. A Davy lamp in Germany, and even in America, is an oil lamp, burning benzoinoline or petroleum spirit upon an asbestos wick, is very popular as giving a much better light than oil. Special care is, however, required in filling, so that no free liquid may be left in the lamp. The gauze chimney and any superfluous quantity poured off. Portable electric lamps, supplied by accumulators or dry batteries, have been introduced into coal-mines; but owing to the weight and cost their use is as yet very limited.

The ordinary safety-lamp affords indications of the presence of fire-damp (marsh gas) in the air of a mine. When the amount exceeds 2 or 3%, it may be detected by reducing the flame till it is seen to be almost extinguished. In this case the intense heat of the flame will be seen above the ordinary flame. This varies in size with the percentage of fire-damp, until when there is about 10% the blue flame fills the whole interior of the gauze cylinder. If the lamp is then raised by an outer cylinder the blue flames will be seen; and more useful method is that of Dr F. Cloewer, who uses a hydrogen flame 0.4 in. long, obtained by attaching a cylinder containing compressed hydrogen to an ordinary safety-lamp. When used for gas testing the hydrogen is turned into the oil flame, which for the time becomes non-luminous, and after a short while the red flame appears. So small a proportion as 0.2% of gas can be detected by this method.

The locking of safety-lamps, so as to render them incapable of being opened by the miners when at work, is a point that has given great importance. The best method is a combination of the lock with the gauze holder, and the key is used to turn the lock, and, when the gauze is locked, charged with gas the light is extinguished.

In the lamp invented by Dr W. Reid Clanny (1776–1850) about the same time as those of Davy and Stephenson, a glass cylinder is substituted for the lower portion of the wire gauze. The air for supporting the flame is drawn in through the chimney at the bottom and drawn out through the gauze at the top, and the whole lamp is charged with gas, the light being extinguished.

See S. Lane Poole, Mahomedan Dynasties (1854), p. 129; Stocklweis, Manuel d'histoire (Leiden, 1888), vol. i. p. 137; on the later Saffarids, A. Saffarides, in the Numismatic Chronicle (1881).

Saffarids, a Persian dynasty of the 9th century, founded by Yakub (Yaqub) b. Laith b. Saffar ("coppersmith") about 866, who, originally a leader of bandits and outlaws, became governor of Sejistan. Soon after he added to his province Herat, Fars, Balkh, and Tokharistan, overthrew the Tahrids in Khorasan, and, nominally still dependent on the caliphs of Baghdad, established a dynasty in Sejistan (see CALIPHATE, section C, Abbasids, § 10, and PERSIA: History, section B). Soon after 900 the dynasty became subordinate to the Sâmânis (q.v.) and few of its rulers had any real authority. Under the last of the dynasty, Tabârid IV, the family was extinguished (1197); the last of the Khwarizm shahs, the country was captured by the Mongols.

Saffi, or Asfi, a seaport on the west coast of Morocco, in 32° 20' N. 5° 12' W., 106 m. W.N.W. of Marrakesh. (Pop. about 15,000.) Although the principal wool and grain port of central Morocco, the anchorage is an open roadstead and communication with the shore is at times difficult. The old palace with
SAFFLOWER—SAFFRON WALDEN

beautifully decorated courts in fair repair, built by Mohammed
XVII., is a prominent object above the town, and there are
many interesting buildings and ruins.

SAFFLOWER (ultimately from the Arabic safrān, yellow) or
BASTARD SAFFRON (Carrhotus tinctorum), a plant of the natural
order compositae; its flowers form the basis of the safflower
dye of commerce. The plant is a native of the East Indies, but
is cultivated in Egypt and to some extent in southern
Europe. To obtain the dyeing principle—carrhamin, CaH₂O₃—the
flowers are first washed to free them from a soluble yellow
colouring matter they contain; they are then dried and powdered,
and digested in an alkaline solution in which pieces of clean white
cotton are immersed. The alkaline solution having been neutral-
ized with weak acetic acid, the cotton is removed and washed in
another alkaline solution. When this second solution is neutral-
ized with acid, carrhamin in a pure condition is precipitated
as a dark red powder. It forms a brilliant but fugitive scarlet
dye for silk, but is principally used for preparing toilet rouges.

SAFFRON (Arab. safrān), a product manufactured from the
dried stigmas and part of the style of the saffron crocus, a
cultivated form of Crocus sativus; some of the wild forms (var.
Thomasi, Cartwrightiensis) are also employed for the man-
facture. The purple flower, which blooms late in autumn,
is very similar to that of the common spring crocus, and the
stigmas, which are protruded from the perianth, are of a characteristic orange-red colour. The fruit is rarely
formed. The Egyptians, though acquainted with the bastard
safflower, do not seem to have possessed saffron; but it is
named in Canticles iv. 14 among other sweet-smelling herbs.
It is also repeatedly mentioned (κροκός) by Homer, Hippocrates
and other Greek writers; and the word “crocodile” was long
supposed to have been derived from κροκός and δέλδα, whence
we have such stories as that “the crocodile’s tears are
never true save when he is forced to croak” (safron growth )
(Fuller’s Worthies). It has long been cultivated in Persia and
Kashmir, and is supposed to have been introduced into China
by the Mongol invasion. It is mentioned in the Chinese materia
medica (Pun isou, 1552–1578). The chief seat of cultivation
in early times, however, was the town of Corycus (modern
Korghaz) in Cilicia, and from this central point of distribution
it may not improbably have spread east and west. According
to Heth, the town derived its name from the crocus; Reymond, on
the other hand, with more probability, holds that the name of the
drug arose from that of the town. It was cultivated by the
Arabs in Spain about 961, and is mentioned in an English leech-
book of the 10th century, but seems to have disappeared from
western Europe till reintroduced by the crusaders. According
to Hakluyt, it was brought into England from Tripoli by a
pilgrim, who hid a stolen corn in the hollow of his staff. It was
especially cultivated near Hinton in Cambridgeshire and in
Essex at Saffron Walden, its cultivators being called “croakers.”

Saffron was used as an ingredient in many of the complicated
carriages of early times. That it was very largely used in
cookery is evidenced by many writers; thus Laurenbergius
( Apparatus plantarum, 1632) makes the large assertion “ In
temarii vixor est telluris habituatus angelus ubi non sit
crocis quotidiana usurpatio aspersi vel incerti cibis.” The
Chinese used also to employ it largely, and the Persians and
Spaniards still mix it with their rice. As a perfume it was
strung in Greek halls, courts and theatres, and in the Roman
baths. The streets of Rome were sprinkled with saffron when
Nero made his entry into the city.

It was, however, mainly used as a dye. It was a royal colour
in early Greek times, though afterwards, perhaps from its abundant
use in the bath, it was gradually appropriated by the hetaireis. In ancient Ireland a king’s
mantle was dyed with saffron, and even down to the 17th century the “lein-croich,” or saffron-dyed shirt, was worn by persons
of rank in the Hebrides. In medieval illumination it furnished,
as a glaze upon burnished tinfoil, a cheap and effective
substitute for gold. The sacred spot on the forehead of a Hindu
pundit is also partly composed of it. Its main use in England
was to colour pastry and confectionery, and it is still used for
this purpose in some parts of the country (notably Cornwall).

One grain of saffron rubbed to powder with sugar and a little water
imparts a distinctly yellow tint to ten gallons of water. This
colouring power is due to the presence of polychlorite, a substance
which is not soluble in water, and is not formed by the drying of
the flowers. The solution may be obtained by treating saffron with ether, and afterwards exhausting with water. Under acids it yields the following reaction—
CaH₂O₃ + H₂O = 2CaH₂O₂ + CaH₂O₂ + CaH₂O₄.

Balgawin, according to Watts, Dict. of Chem., has a composition of
CaH₂O₄ or CaH₂O₆. This crocin is a red colouring matter, and it
is surmised that the red colour of the stigmas is due to this reaction
taking place in nature.

Crocus is chiefly cultivated in Spain, France, Sicily, on the
lower spurs of the Apennines and in Persia and Kashmir. The
ground has to be thoroughly cleared of stones, manured and trenched,
and the corms are planted in ridges. The flowers are gathered at
the beginning of May, in the evening, just when they are beginning
to open after the night. The stigmas and a part of the style are
very carefully picked out, and the wet saffron is then scattered on sheets
of paper to a depth of 2 or 3 in.; over this a cloth is laid, and next a board with a heavy weight. A strong heat is applied for about two
hours so as to make the saffron “sweat,” and a gentler temperature
for a further period of twenty-four hours, the cake being turned
every hour so that every part is thoroughly dried. This is known as "saffron" to distinguish it from "hay saffron," which consists
merely of the dried stigmas.

The drug has naturally always been liable to great adulteration
in spite of penalties, the severity of which the surviving
works of its degraded charmers is to be felt. In Nuremberg a regular
saffron inspection was held, and in the 15th century we read of
men being burned in the market-place along with their adulterated
saffron, while on another occasion three persons convicted of the
same crime were burned at the stake, with their hands and feet still very
frequently mixed with the cake, and shreds of beef dipped in saffron
water are also used. Good saffron has a deep orange-red colour;
it is light yellow or blackish, it is bad or too old.

SAFFRON WALDEN, a market-town and municipal borough
in the Saffron Walden parliamentary division of Essex, England,
beautifully situated on the Cam in a valley surrounded by
hills, on a branch of the Great Eastern railway, 43½ m. N.N.E.
from London. Pop. (1901) 8566. It has somewhat ancient
appearance and possesses a spacious market-place. Of the old
castle, dating probably from the 12th century, but in part
protected by much earlier earthworks, the keep and a few other
portions still remain. Near it are a series of curious circular
carvings in the chalk, called the Maze, of unknown date or
purpose. The earthworks west and south of the town are of
great extent; there was a large Saxon burial-ground here.
The church of St Mary the Virgin, a beautiful specimen of the
Perpendicular style, dating from the reign of Henry VII., but
frequently repaired and restored, contains the tomb of Lord
Audley, chancellor to Henry VIII. There is an Edward VI.
grammar school, occupying modern buildings. The town posses-
ses a museum, in which good archaeological and natural history
collections, a literary institute and a horticultural society.
The beneficent institutions include the hospital and the Edward
VI. almshouses. There is a British and Foreign School Society's
training college for mistresses. In the neighbourhood is the
fine mansion of Audley End, built by Thomas, 1st earl of Suffolke, in
1603 on the ruins of the abbey, converted in 1790 from a
Benedictine priory founded by Geoffrey de Mandeville in 1136.
Brewing, malting and iron-founding are carried on. The
borough is under a mayor, 4 aldermen and 12 councillors.
Area, 7592 acres.

Saffron Walden (Waledana) was almost certainly fortified by
the Britons, and probably by some earlier earthworks. The
town corporation grew out of the Guild of the Holy Trinity, which was
incorporated under Henry VIII., the lord of the town, in 1534.
It was dissolved under Edward VI., and a charter was obtained
in 1635, when the town, with its market, heavy toll and chamberlain and twenty
four assistants, all elective, with which it was consequently formed.
The corporation became a local board of health under the act of
1858, and a municipal borough in 1875. The culture of
saffron was the most characteristic industry at Walden from the
reign of Edward III. until its gradual extinction about 1768.
SARAFINE—

They are obtained by the joint oxidation of one molecule of a paradimino compound with two molecules of a primary amine; by the condensation of para-aminoazo compounds with primary amines (O. Witt, <br>"Ber.," 1877, 10, p. 874), and by the action of para-nitrosodialkylanilines with secondary bases such as diphenylmethylenediamine. They are crystalline solids showing a characteristic green metallic lustre; they are readily soluble in water and dye red or violet. They are strong bases and form stable monomeric salts. Their alcoholic solution shows a yellow-red fluorescence.

Phenosafranine is not very stable in the free state; its chloroform solution being readily diazотized and the diazotium salt when boiled with alcohol yields aposafranine or benzene indoline, C6H4N2. F. Kehrmann showed that aposafranine could be diazотized in the presence of cold concentrated sulphuric acid, and the diazotisation salt on boiling with alcohol yielded phenylazonaphtholum salts. Aposafranine, C6H4N2Cl, is formed by heating aposafranine with concentrated hydrochloric acid. These three compounds are perhaps to be represented as ortho- or paraquinonines (see papers by F. Kehrmann, O. Fischer, and E. Hepp; R. N. Ziehlski and others, "Ber.," 1895 et seq.). The "safranine" of commerce is a tolusafranine.

The first aniline dye-stuff to be prepared on a manufacturing scale was mauveine, C6H4N2Cl, which was obtained by Sir W. H. Perkin by heating crude aniline with potassium bichromate and sulphuric acid. It is a N-phenylsafranine (see indinines).

SAGA (literally a story committed to writing), a word derived from Icel. segga, to say. The term is common to most of the Teutonic languages, where we find Eng. say, Ger. sagen, the O. Eng. seccan, Dan. sige and Swed. segga, all identical in meaning. A saga, therefore, was originally something reported, segin sago, a tale told, in English a a tale. But the earliest literature of Scandinavia goes back to an age before writing was invented, and when the legends were first put down they were called sagas because they were things which had been told or repeated from mouth to mouth. The early books speak of sagas which, apparently, had never been written down and were in consequence lost; but, as soon as the art of writing was understood, the word saga began for the future to be used exclusively for written historical books. A volume made up of such histories was known as a sögubók or book of sagas. They were not rigidly historical; any story which was written down, and repeated according to the literary formula, was called a saga. The telling of tales was a recognized form of entertainment at Icelandic banquets, and in Haralds saga Harðbœða there are very interesting details regarding these public saga-tellings: the person who repeated or read the tale being known as the sögmundr or sagan man and being held in honour at the feast.

The saga was properly a collection of the peculiar conditions under which Icelandic society was constituted in the earliest medieval times. The aristocratic Icelander had no diversions, except games of strength and skill out of doors and the listening to professional story-tellers indoors. As has been often pointed out, the saga is a prose epic, and in its various kinds it follows strict laws of composition. The lesser epic, in its original form, was the biography of some heroic Icelander who had lived in the 10th or 11th century. It was composed with great regularity, so as to proceed uniformly from the birth of the hero to his death, and indeed from before the one date until after the other. The style is brief, clear and conversational; the hero was often a distinguished poet, and in that case some of the best of his verses are interwoven into the narrative, being put in his mouth on striking occasions. Alliteration takes a great part in the ornament of the style. The skill with which the story is told, the high romantic sense of honour and courage which is displayed, the quick turns of the dialogue, the brilliant evolution of the plot, all these give enduring charm to the more successful and ample of the sagas, and in the earlier examples these qualities are very rarely missing. It is to be remembered, however, that the saga was intended to be listened to, not read, by an audience which was mainly interested in three subjects, namely fighting, litigation and pedigree. It was illegitimate for the saga-man in the preparation of his epic, to allow himself to stay for any length of time from one of those three; since even love must be concealed in the light of an episode.

The period of the saga-age, as it was called, the old or epoch celebrated in the sagas, is now confined between the years 890 and 1030, and opens with the original colonization of Iceland. The deaths in 1030 of two great statesmen, Snorri and Skapte the Lawman, mark its close; almost immediately afterwards, before the end of the 11th century, the actual age of saga-composition is in full action; and lastly comes the rit-fólki, or age of writing when the sagas were preserved in their present literary form, the blossoming time of which was the 13th century. According to the definite statement of the great historian, Sturla, the first man who wrote down in the Norse tongue, in Iceland, "histories relating to times ancient and modern," was Ari Fróði (1067-1148); he was therefore the earliest of the saga-writers. He, as we know, was the author of three works of vast importance in the history of Icelandic literature. These were Konunga-bók or the Book of King, Landnámabók or the Book of Settlements and Íslendinga-bók or the Book of Icelanders. The second of these, in which Ari was assisted by Kolsegg Asbjornsson, survives and is of priceless value. Of the first and third, we possess abbreviations and summaries. It is believed that the admirable style in which the sagas are composed was the invention of Ari, to whose individual genius the form of classic prose tradition is attributed. He has no rival in this respect, and is the true father of the Icelandic saga. The works of Saemund Vigfusson (1050-1133), who succeeded Ari as a writer of the lives of kings, are unfortunately lost.

We now pass to what are called the Greater or Íslendinga sagas, which are of a more intense and romantic character than the historical biographies. Among these the greatest is Njáls saga (or Njála), which few critics will question to be the most eminent masterpiece of Icelandic literature. There is no clue to the name of the author, who was evidently a lawyer; extensive as is the work, it is evidently written by one hand, for peculiarities and felicitous originalities of style recur throughout the whole saga. It must have been composed between 1230 and 1280. Vigfusson has described Njála as being, par excellence, the saga of law, and adds, "the very spirit indeed of Early Law seems to breathe through its pages." The scene in which Njála, the Lawman of judgment and peace, is burned in his stead by his enemies is perhaps the most magnificent passage which has been preserved in the whole ancient literature of the North. The story of Njála is placed at the close of the 10th and the first years of the 11th century. Eyþyrjógs saga deals with policies as Njáls saga deals with law; it is a precious compendium of history and tradition handed down from heathen times. It has been suggested that it may be, at all events in part, the work of Sturla the Lawman, who died in 1284. Extremely beautiful in its relation to external nature, a matter often ignored in the sagas, is Loðsdeilssaga, which is also the most romantic in sentiment. It was probably written about 1235, but by whom is unknown. The aristocratic spirit of the great Icelandic families finds its most characteristic exposition in Egils saga, a very vigorous tale of adventure, the central figure of which, Egil, is depicted with more psychological subtlety than is usual in the sagas; it probably belongs to about 1320. Into Grettissaga there enter biographical and mythical elements, curiously mingled; it is also confused in form, and is probably a recension, made about 1310, of two or more earlier sagas now lost, the finest parts of which it is thought that Sturla may have written. These are the five famous groups of anonymous narrative which are known as the Greater Sagas.

The Minor Sagas must be treated more briefly. Hensóforissa, belonging to the south-west of Iceland, deserves attention because of its extreme antiquity; it has been dated 973. Gunnlaugs saga Ormsjöng (The Story of Gunnlaug Worm-
Tongue) is a love-story of great sentimental charm. In *Gislasaga* the gloom of the Icelandic outlaw-life is strikingly depicted in the adventures of Gisli, who is under a ban and is hunted from place to place. A very unusual specimen of the minor saga is *Bandamannasaga*, a comic story of manners in the north of Iceland in the 11th century, in which an intrigue of the old families banded against the pretensions of a wealthy parvenu, is told in a spirit of broad humour. The most archaic of the minor sagas is *Kormaks saga*, the story of the loves of the dark-eyed Kormak and Steingræda; this is, according to Vigfusson, the most primitive piece of Icelandic prose writing that has come down to us. Another very ancient and very simple saga is *Vatadalasaga*. Among sagas which deal with the earliest history of America in the chronicles of Greenland and Vinland, a foremost place is taken by *Flóamannasaga*, which possesses peculiar interest from its description of the shipwreck of colonists on the coast of Greenland; this belongs to the close of the 10th century. We possess a late (13th century) recension of what must have been equally important as a record of the Greenland colony in the 11th century, *Fóstbæradssaga*. Vigfusson forms the hypothesis of still shorter sagas than these, *thetar* or "morsels" of narrative. At the close of the great period of the composition of all these anonymous sagas, of which few can have been written later than 1260, a work of enormous length and value was composed or compiled by a poet and historian of great eminence, Sturla Thordsson (1215–1284). About the year 1270 he began to compile the mass of sagas which is now known by his name as *Sturlungsaga*. The theory that Sturla was the author of the whole of this bulky literature is now abandoned; it is certain that *Hrafn Steinþórsoñs saga*, for instance, belongs to an earlier generation, and the same is true of *Guðmundar Saga Gøða*. Vigfusson distinguished these and other sagas, which Sturla evidently only edited, from those which it is certain that he composed, and gathered the latter together under the title of *Islandingsaga*. It is certain that it is to Sturla that we owe almost all our knowledge of Icelandic history from 1200 to 1260. *Islandingsaga* is divided into two main sections, the former closing in a general massacre of the characters of the story in about 1240, the latter dealing more minutely with new persons and subsequent events. To Sturla also are attributed two saga-biographies, the *Hakonssaga* and the *Magni ssaga*. It is a remarkable fact that while Icelandic saga-literature begins and ends with a definite figure of a writer, all that lies between is wholly anonymous. Ari was the earliest and Sturla the latest of the saga-writers of the classical period, but in the authors of *Njála* and *Laxdæla* we have nameless writers whose genius was still greater than that of the pioneer and of the rear-guard of Icelandic literature. These unknown men deserve a place of honour among the best narrative-writers who have ever lived. The elder brother of Sturla was called Olaf Hvítskald, or the White Poet (1200–1259); he was a learned man, who worked at the arrangement and compilation of the sagas which form the mass of *Sturlunga*. In another class are the stories of bishops, *Biskupasógr*, which are not sagas in the true sense, but have considerable value as biographical material for reconstructing Icelandic social life in the 12th century. The admirable *Biskupasógr* of Bishop Bryggði (1230–1231) was composed by his private secretary, Einar Hálfdadson (1204–1253) who also wrote *Annals*, and is the latest Icelandic biographer. After his time a long silence fell on the literature of the country. A silence not broken until the revival of Icelandic learning in the 17th century.

It is evident that a vast number of sagas must be lost; when we consider how many are preserved, we can only express amazement at the fecundity of the art of saga-telling in the classic age. The MSS. are few, very few, and there were no sagas written on paper until the time of Bishop Odd, who died in 1630; there was an enormous destruction ofvellums during the dark age. After 1640 it became the practice to make transcripts on paper from the perishable vellum MSS. The best authority on the history of the sagas is the copious *Prolegomena* to Dr Guðbrand Vigfusson's edition of the text of *Sturlungsaga*, published in 2 vols., by the Clarendon Press at Oxford in 1878. See also the edition of *Biskupasógr*, issued by the same author, at Copenhagen, in 1858. Möbius and Vigfusson published the *Fornsægur* or archaic sagas in 1860, and all the work of Vigfusson calls for the closest attention from those interested in this subject. In connexion with the deeds of Northmen on the shores of Britain, particular interest attaches to the four volumes of sagas edited for the "Rolls" series (1887–1894). William Morris, who had done much to interpret the spirit of the sagas to English readers, and who published a translation of *Grétissaga* in 1860, started in 1891 the *Sagas Library*, in connection with Mr E. M. Kempe, and this a sixth volume appeared in 1906. Mr Sepphon has published several of the purely historical sagas. No account has been given above of the famous *Heimskringla* or "Round of the World," of the saga *Fljótis*, which begins in the 12th century, and contains stories of the kings of Norway, hardly belongs to the same class as the biographical sagas of Iceland. The *Heimskringla* is purely a storehouse of primitive Norwegian history.

See also Jónsson, *Der aldnordische und aldislandische Literaturhistorie* (Copenhagen, 1893–1902); F. W. Horn, Geschichte der Literatur des skandinavischen Nordens (Leipzig, 1879).

**SAGAIN, a district and division of Upper Burma, lying to the south and west of Mandalay. The district has an area of 1862 sq. m.; pop. (1901) 282,658, showing an increase of 15% in the decade. It occupies both banks of the Irrawaddy, at its confluence with the river Chindwin. The chief crops are sesame, millet, rice, peas, wheat and cotton. The total rainfall in 1905 was 34.76 in., taken at Sagain. In the hot season the maximum shade temperature rises to a little over 100 F. The lowest readings in the cold season average about 56 F.

Sagain, the headquarters town, is opposite Ava, a few miles below Mandalay; pop. (1901) 9643. It was formerly a capital of Burma. It is the terminus of the railway to Myitkyina. A steam ferry connects with the Rangoon-Mandalay line, and the steamers of the Irrawaddy Flotilla Company call daily.

The Sagain division includes the four districts of Upper and Lower Chindwin, Shwebo and Sagain; area, 29,566 sq. m.; pop. (1901) 1,096,452.

**SAGALLO, a small settlement on the north shore of the Gulf of Tajura, French Somaliland. A dismantled fort built by the Egyptians (who occupied the place between 1875 and 1884) is the most prominent object. In January 1889 Sagallo was occupied by a Cossack chief named Achinov, who was accompanied by the archimandrite Paisi and some 200 people, including priests, women and children. Paisi had been entrusted by the metropolitan of Novgorod with an evangelistic mission to the Abyssinian Church; while Achinov stated that he had a commission from the Negus for the purchase of arms and ammunition.

The presence of Achinov at Sagallo (where he occupied the fort, which he had deserted) was regarded by the French government as an invasion of French territorial rights. The Russian foreign office having disavowed (7th of February) any connexion with Achinov, instructions were sent from Paris to secure the removal of the Cossacks. On the 17th of February French warships appeared off the port, and an ultimatum was sent to Achinov calling on him to surrender, but without effect. The fort was bombarded, and seven persons killed, two being women and four children. The Cossacks then surrendered, not having fired a shot. They were subsequently deported to Suez, whence they returned to Russia. Achinov was interned by the Russian government for some months (until October 1889). In 1891 he returned to Abyssinia. Paisi was promoted by his ecclesiastical superiors. In Paris the incident caused great excitement amongst the Russians, and the consequent demonstrations led to the suppression of the League of Patriot and the prosecution of M. Paul Drouléude.

**SAGAN, a town of Germany, in the Prussian province of Silesia, situated on the Bober, a tributary of the Oder, 60 m. S.S.E. of Frankfort-on-Oder and 102 m. S. E. of Berlin by the direct main line of railway to Breslau. Pop. (1905) 14,208. It is still partly surrounded by its old fortifications and has numerous medieval houses. It contains the handsome palace of the dukes of Sagan. Among other buildings are an Evangelical church with a conspicuous steeple and containing the burial vaults of the ducal family, and Augustine and a Jesuit
SAGA—SAGINAW

monastery, a medieval town-wall with old cloisters attached, a Roman Catholic gymnasium and a large hospital, named after its founder, the duchess Dorothea (1753–1810), wife of Edmundo, duke of Talleyrand-Périgord-Dino. The leading industry of the town is cloth-weaving, with wool and flax spinning; there is also some trade in wool and grain. The mediate principality of Sagan, now forming a portion of the Prussian governmental district of Liegnitz, and formed in 1397 out of a portion of the duchy of Glogau, has several times changed hands by purchase as well as by inheritance. One of its most famous possessors was Wallenstein, who held it for seven years before his death in 1634. Bought by Prince Lobkowitz in 1646, the principality remained in his family until 1787, when it was sold to Peter, duke of Courland, whose descendant, Prince Bozon (b. 1837), son of Napoleon Louis (1811–1890), duke of Talleyrand-Périgord, owned it in 1910. The principality has an area of nearly 300 sq. m. and a population of 65,000.

SAGINAW or SAUGOR ISLAND, an island at the mouth of the Hugi river, in the Twenty-four Parganas district of Bengal. The word means “sea” and, as being the place where the sacred stream of the Ganges is believed to mingle with the ocean, the island is one of the most frequented places of Hindu pilgrimage in all India, the time for the greatest annual gathering being in January. On the seaward face is a lighthouse, and farther out are the Sandheads, the gun-circling ground of the Calcutta pilots.

SAGASTA, PRAXEDES MATEO (1837–1903), Spanish statesman, was born on the 21st of July 1827 at Torrecilla de Cameros, in the province of Logroño. He began life as an engineer, and from his college days he displayed very advanced Liberal inclinations. He entered the Cortes in 1854 as a Progressist deputy for Zamora. After the coup d'etat of Don Leopoldo O'Donnell in 1854, Sagasta had to go into exile in France, but promptly returned, to become the manager of the Progressist paper La Iberia, and to sit in the Cortes from 1856 to 1863. He sided the Progressist in and voluntary campaign of Prim and the Progressists against the throne of Queen Isabella, conspiring and going into exile with them. He returned, via Gibraltar, with Prim, Serrano and others, to take part in the rising at Cadiz, which culminated in the revolution of September 1868, and Sagasta was in succession a minister several times under Serrano and then under King Amadeo of Savoy, 1868–1872. Sagasta ultimately headed the most Conservative groups of the revolutionary politicians against Ruiz Zorrilla and the Radicals, and against the Federal Republic in 1873. He took office under Marshal Serrano during 1874, after the promovimiento of General Pavia had done away with the Cortes and the Federal Republic. He vainly attempted to crush the Carlists in 1874, and to check the Alphonsoist military conspiracy that overthrew the government of Marshal Serrano at the end of December 1874. Barely eight months after the restoration of the Bourbons in June 1875, Sagasta resigned, and organized the Liberal dynastic party that confronted Canovas and the Conservatives for five years in the Cortes, until the Liberal leader used the influence of his military allies, Jovellar, Campos and others, to induce the king to ask him to form a Cabinet in 1881. The Liberals only retained the confidence of the king by postponing the realization of almost all their democratic and reforming programme, and limiting their efforts to financial reorganization and treaties of commerce. A military and republican rising hastened Sagasta’s fall, and he was not reappointed to the councils of Alphonso XII. On the death of that king in 1885, Sagasta became premier with the assent of Canovas, who suspended party hostility in the early days of the regency of Queen Christina. Sagasta remained in office until 1890, long enough to carry out all his reform programme, including universal suffrage and the establishment of trial by jury. A coalition of generals and Conservatives turned Sagasta out of office in July 1890, and he only returned to the councils of the regency in December 1892, when the Conservative party split into two groups under Canovas and Silvela. He was still in office when the final rising of the Cubans began in February 1895, and he had to resign in March because he could not find superior officers in the army willing to help him to put down the turbulent and disgraceful demonstrations of the subalterns of Madrid garrison against newspapers which had given offence to the military. Sagasta kept quiet until nearly the end of the struggle with the colonies, when the queen-regent had to dismiss the Conservative party, much shorn of its prestige by the failure of its efforts to pacify the colonies, and by the assassination of its chief, Canovas del Castillo. Sagasta’s attempt to conciliate both the Cubans and the United States by a tardy offer of colonial home rule, the recall of General Weyler, and other concessions, did not avert the disastrous war with the United States and its catastrophe. The Liberal party and Sagasta paid the penalty of their lack of success, and directly the Cortes met in March 1899, after the peace treaty of the 10th of December 1898 with the United States, they were defeated in the senate. He pursued his policy of playing into the hands of the sovereign whilst keeping up the appearances of a Liberal, almost democratic, soundly skillful in debate a formidable par excellence, and aper in opposition than in office. He returned with the Liberals to power in March 1901. His task, however, was beyond his years. The economic situation was of the gravest. Strikes and discontent were rife. Still, Sagasta held on long enough to witness the surrender of the registry by Queen Christina into the hands of her son, Alfonso XIII., in May 1902. In the following December Sagasta was defeated on a vote of censure and resigned office. Shortly afterwards he fell into ill-health, and died at Madrid on the 15th of January 1903.

SAGE, RUSSELL (1816–1906), American financier, was born in Verona township, Oneida county, New York, on the 4th of August 1816. He worked as a farm-hand until he was 15, when he became an errand boy in a grocery conducted by his brother, Henry R. Sage, in Troy, New York. He had a part interest in 1837–1839 in a retail grocery in Troy, and in a wholesale business in Troy at the same time. He served as an alderman of Troy in 1842–1848, and as treasurer of Rensselaer county in 1845–1849. In 1853–1857 he was a Whig representative in Congress. He became an associate of Jay Gould in the development and sale of railways; and in 1863 removed to New York City, where, besides speculating in railway stocks, he became a money-lender and a dealer in “puts” and “calls” and “privileges,” and in 1874 bought a seat in the New York Stock Exchange. He gradually accumulated a fortune, which at his death was variously estimated as from $60,000,000 to $80,000,000. On the 4th of December 1897 an attempt was made to assassinate him in his office by one Henry Norcross, who demanded a large sum of money, and upon being refused exploded a dynamite bomb, and was himself killed.1 Sage died in New York on the 22nd of July 1906. In 1869 he had married Miss Margaret Olivia Slocum (b. 1848), a graduate (1847) of the Troy Female Seminary (now the Emma Willard School). She inherited nearly all of his great fortune, and out of it she gave away a long series of liberal benefactions to various institutions.

SAGINAW, a city and the county-seat of Saginaw county, Michigan, U.S.A., situated on both banks of the Saginaw river, about 16 m. from its entrance into Saginaw Bay and about 66 m. N.W. of Detroit. Pop. (1890) 46,322, (1900) 47,345, of whom 11,435 were foreign-born, (1910) 50,510. Saginaw is served by the Grand Trunk, seven divisions of the Pere Marquette (which has repair shops here) and four divisions of the Michigan Central railways, by interurban electric railways to Detroit and Bay City, and by steamboat lines to several of the lake ports. The city is built on level ground covering an area of about 13 sq. m. and somewhat more elevated than the surrounding country. In the city are St. Vincent’s Orphan Home (1875) and St Mary’s Hospital (1874) under the Sisters of Charity, a Woman’s Hospital (1888) and the Saginaw General Hospital.

1 Mr. Sage’s secretary was also killed, and one of his clerks, W. R. Laidlaw, jr., was badly injured. Laidlaw afterward repeatedly sued Sage for damages, claiming that Sage had used him as a shield at the moment of the explosion, but his suits were unsuccessful.
SAGITTA—SAGUENAY

(1887); the Hoyt Library and the Public Library; a large auditorium, belonging to the city; an armoury; the Germania Institute, with a kindergarten, a gymnastic school and a German library; and a free bathhouse and martial training school (1903), a part of the public school system. There is an annual music festival in May. The city has parks, including Hoyt Park (27 acres), used for athletic sports, Rust Park (150 acres), occupying an island in the river, and Riverside Park, a pleasure resort. Saginaw is situated in a good farming region with a fertile soil, especially adapted to the culture of sugar beets; other important crops are beans, cabbages, tomatoes, cucumbers, hay, apples and grains. In the vicinity of the city there are salt wells, and Saginaw county is the most productive coalfield in the state—in 1907 its output was 1,047,027 tons, more than half the total for the state. The city is an important distributing centre, has a large wholesale trade (especially in groceries, hardware, boots and shoes, and dry goods), and in 1904, in the value of its factory products ($10,403,508, 20.2% more than in 1900) it ranked fifth among the cities of the state. The municipality owns and operates the water-works. The first settlement was made on the west bank of the river in 1815 and was called Saginaw City; the settlement on the east side of the river made in 1849 was called East Saginaw and was financed by Eastern capitalists. East Saginaw was incorporated as a village. East Saginaw and Saginaw City each received a city charter in 1859, but in 1890 the two were consolidated as the city of Saginaw, and in 1897 the charter was revised.

SAGITTA (*the arrow* or *dart*), in astronomy, a constellation of the northern hemisphere, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.), and catalogued by Ptolemy, Tycho Brahe and Hevelius, who each described 5 stars. The fable was that this constellation was one of the arrows with which Hercules killed the vulture which gnawed the liver of Prometheus. *S. Sagittae* is a short period variable, period 8-38 days, range in magnitude 5-6 to 6-4.

SAGITTARIUS (*the archer*), in astronomy, the 9th sign of the zodiac (q.v.) denoted by the symbol ♐ an arrow or dart. It is also a constellation, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.), and catalogued by Ptolemy, 31 stars, Tycho Brahe 14 and Hevelius 22. The Greeks represented this constellation as a centaur in the act of shooting an arrow, and professed it to be Crotus, son of Eupheme, the nurse of Theseus. Several short period variables occur in the constellation, e.g. X3 Sagittarii, Wy, Sagittarii and Y Sagittarii, having periods of 7-01, 7-59, 5-77 days respectively. *Nova Sagittarii* is a *new* star, which was discovered by Mrs Fleming in 1890; the nebula M. 17 Sagittarii is an omega or horseshoe nebula, while the nebula and cluster M. 8 Sagittarii is a splendid irregular nebula associated with a great number of faint stars.

SAGO, a food-starch prepared from a deposit in the trunk of several palms, the principal source being the sago palm (*Metroxylon Sagu*) (see fig.), a native of the East Indian Archipelago, the sago forests being especially extensive in the island of Ceram. The trees flourish only in low marshy situations, seldom attaining a height of 30 ft., with a thick-set trunk. They attain maturity as starch-yielding plants at the age of about fifteen years, when the stem is gorged with an enormous mass of spongy medullary matter, around which is an outer rind consisting of a hard dense woody wall about 2 in. thick. When the fruit is allowed to form and ripen, the whole of this starchy core disappears, leaving the stem hollow, and the tree immediately after ripening its fruit dies. When ripe the palms are cut down, the stem divided into sections and split up, and the starchy pith extracted and grated to a powder. The powder is then kneaded with water over a strainer, through which the starch passes, leaving the woody fibre behind. The starch settles in the bottom of a trough, in which it is floated, and after one or two washings is fit for use by the natives for their cakes and soups. That intended for exportation is mixed into a paste with water and rubbed through sieves into small grains, from the size of a coriander seed and larger, whence it is known according to size as pearl sago, bullet sago, &c. A large proportion of the sago imported into Europe comes from Borneo, and the increasing demand has led to a large extension of sago-palm planting along the marshy river-banks of Sarawak.

Sago is also obtained from *Metroxylon Rumphii* as well as from various other East Indian palms such as the Gomuti palm (*Arenga saccharifera*), the Kittul palm (*Caryota urens*), the cabbage palm (*Corypha umbraculifera*), besides *Corypha Gebagon, Raphia flaheliformis* and *Phoenix farinifera*, also from *Mauritius fleszoo* and *Gomuana speciosa*, two South American species. It is also obtained from the pitch of species of *Gas*.

SAGUENAY, a river of Quebec province, Canada, flowing into the St Lawrence 120 m. N.E. of Quebec. It drains Lake St John, from which it issues by two impassable rapids, La Grande and La Petite Décharge. Thence for 40 m. it flows E.S.E. in a series of rapids, navigable only by skilled boatmen in canoes, to Chicoutimi, the seat of a Roman Catholic bishop, a prosperous little town exporting great quantities of lumber. Six miles farther down is Ha Ha Bay, a favourite summer resort. From Chicoutimi the river is navigable by small steamers, and from Ha Ha Bay to the mouth by vessels of the largest size. It is indeed rather a loch or bay than a river, containing neither rock nor shoal, and having at its mouth a depth of some 600 ft. greater than that of the St Lawrence. Its width varies from three-quarters of a mile to two miles, and the waters are blackened by the shadow of treeless cliffs, over 1000 ft. in height, separated here and there by narrow wooded valleys, and culminating in Capes Trinity and Eternity, 1600 and 1800 ft. in height. Above Chicoutimi it runs through hills of about 400 ft. in height, densely wooded, with spruce, maple and birch. Tadoussac, at its mouth, is the oldest European trading post in Canada.

Lake St John is a shallow basin, 26 m. by 20, with an area of 365 sq. m. It receives the waters of the Ashuapmushuan, often spoken of as the upper course of the Saguenay, the Mistassini, the Peribonka and various other important streams. A numerous farming population live near its shores. It is well known to anglers as containing the celebrated *omianische*, or land-locked salmon, which attains a weight of about 6 lb.
SAGUNTUM—

SAGUNTUM, now Sagunto or Murviedro, an ancient town in a fertile district of eastern Spain (Castellon de la Plana) 20 m. N. of Valencia, close to the coast. Its history comprises one brief flash of tragic glory and a long obscure happiness. At the outbreak of the Second Punic War (219 B.C.) it was a large and commercially prosperous town of native—not Greek—origin. It sided with Rome against Carthage, and drew Hannibal's first assault. Its long and noble resistance, told by the Roman

Sarragonese in no less noble language, ranks with the Spanish defence of Saragossa in the Peninsular War. Finally in 218

Hannibal took it and passed on into Italy. Then we hear little more of it till at the opening of the Christian era it appears as a flourishing Romano-Spanish town with a Latin-speaking population and the rank of municipio. This later prosperity lasted most of the empire through, and is attested by inscriptions and ruins (notably a theatre, demolished by Suechi).

SAHARA, the great desert of northern Africa. The Sahara has an area, according to Dr A. Bludau's calculation of the areas of African river basins, of 3,459,500 sq. m., made up as follows:—

<table>
<thead>
<tr>
<th>Category</th>
<th>Area (sq. m.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drainage or slope to Atlantic</td>
<td>131,000</td>

<tr>
<td>Drainage inland</td>
<td>2,630,000</td>
</tr>
<tr>
<td>Slope to Niger basin</td>
<td>224,000</td>
</tr>
<tr>
<td>Total</td>
<td>3,459,500</td>
</tr>
</tbody>
</table>

This includes Tripoli and Fezzan, which practically belong to the desert zone, but does not include arid portions of the basins of the Nile and Niger, in which the drainage is at most intermittent, and which might with reason be included in the Sahara. The area would thus be brought up to about 33 m. sq., or about the area of Europe minus the Scandinavian peninsula.

The physical limits of this region are in some directions marked with great precision, as in parts of Morocco and Algeria, where the southern edge of the Atlas ranges look out on what has almost the appearance of a boundless sea, and forms, as it were, a bold coast-line, whose sheltered bays and commanding promontories are occupied by a series of towns and villages—Tizgi, Figui, El Aghuat, &c. In other directions the boundaries are vague, conventional and disputed. This is especially the case towards the south, where the desert sometimes comes to a close as suddenly as if it had been cut off with a knife, but at other times merges gradually and irregularly into the watered and fertile lands of the Sudan. While towards the east the valley of the Nile at first sight seems to afford a natural frontier, the characteristics of what is usually called the Nilean desert are so identical in most respects with those of the Sahara proper that some authorities extend this designation to the shores of the Red Sea. The desert, indeed, does not end with Africa, but is prolonged eastwards through Arabia towards the desert of Sind. As the Nubian region is described under Sudan: § Anglo-Egyptian, this present article is confined to the country west of the Nile Valley, the Libyan desert inclusive. Its greatest length, along the 20th parallel of north latitude, is some 3200 m.; its breadth north to south varies from 800 to 1400 m.

The sea-like aspect of certain portions of the Sahara has given rise to much popular misconception, and has even affected the ideas and phraseology of scientific writers. Instead of being a boundless plain broken only by wave-like mounds of sand hardly more stable than the waves of ocean, the Sahara is a region of the most varied surface and irregular relief, ranging from 100 ft. below sea-level, and 6000 and even in isolated instances to 8000 ft. above it. The sandstone, and, besides sand-dunes and dunes, containing rocky plateaus, vast tracts of loose stones and pebbles, ranges of the most dissimilar types, and valleys through which abundant watercourses must once have flowed.

In the centre of the Sahara is a vast mountain region known as the Ahaggar (Hoggar) (variously called Ahaggar, also Tassili, to distinguish it from the Ahagar) (Sudan). The culminating peaks of the plateau, Mounts Watellen and Hikena, are about 900 m. in a straight line, and due N. of the mouth of the Niger. They also occupy, speaking roughly, a central position between the Atlantic and the Nile. The Ahaggar plateau is not inferior to the Alps in area, but its highest peaks do not greatly exceed 8000 ft. They are believed to be volcanic like those of Auvergne. Upon their summits snow is reputed to lie from December to March. South-east of the Ahaggar, and towards Egypt, the mountainous region of Tassili (see infra), are the Ahabed mountains. To the north the valley is again contracted by the Irawen mountains.

This central group of mountains, sometimes spoken of as the Ahakar-n'Ahaggar (Summits of the Ahaggar), there are various other masses in the Sahara. On the north-west of the Ahaggar, and separated from it by a wide plain, is the Massif of Tissili, which extends nearly parallel to the Tina. North-east of the Ahaggar (in the direction of Tripoli) is the Massif of the Asjer (4000-5000 ft.), which runs for 300 m. in a N.E. to S.E. direction. South-east of the Tissili of the northern Asjer is the massif of the Tassili of the southern Asjer, to which belongs the massif of the Tassili of the Aschefa, which includes the region of the mountainous region of Tibesti (or Tu), with an average height of 7000 ft., a volcanic cone of Tassili rising to an estimated height of 8800 ft. Towards the south and east the Tibesti highlands and its associated ranges of Borkou and Ennedi, which merge into the plains of Wadis and D. air. The mountains are bare and rocky. By some authorities the Tassili of the Asjer, the Tummo, Borkou and Borko ranges are considered "the orographic backbone" of the Sahara.

In addition to the plateaus and ranges named, there are several disconnected mountain masses. Midway between the Al-akar-n'Ahaggar and Algeria and Niger are the Aror and Ashen hills in which Dr Erwin von Bary discovered (1877) the distinct volcanic crater of Togenji, with its semi-desert landscape, with its sand basin, Air (or q'rb). This basin, which is not included in the Sahara, as it lies within the limit of the tropical rains; but the districts farther south have all the characteristics of the desert. West of Air, and north-east of the bend of the Atlantic, lies the hilly country of the Iforas (or of the Awellinidin (the southern confederacy of the Tuareg), to the N.E., in Fezzan (q'rb.), are the dark mountains of Jebel-es-Soda, which are continued S.E. towards Kufra by the similar range of the Tifernat, and in the extreme W., 1800 m. north of the Atlantic, is the hilly country of the western Adrar (q'rb.).

Nearly all the rest of the Sahara consists in the main of undulating surfaces of rock (distinguished as hammada), vast tracts of watersheds of soil (called Khit, or desert); vast salt-lakes (called Berd, or maglier, arg or arg, igidi, and in the east Irrah), which occupy about one-ninth or one-tenth of the total area. The following is the general distribution of the dunes:

Sand-dunes. The line of dunes, or sand-dunes which extend south of Cape Blanco a broad belt extends N.E. for about 1300 m., with a breadth varying from 50 to 300 m. This is usually called the Etridi of Gidi, from the Berber word for dunes. In part it runs parallel to the coast in the south of Algeria and Tunisia, by the Western Erg and Eastern Erg, separated by a narrow valley at Golea. South of the Eastern Erg (which extends as far north as the neighbourhood of the Gulf of Ghir (or light)), a great tract of desert, bounded on the north by the Hammada al-Homra (or Red Rock Plateau), but to the south of this region lie the dunes of Edeyin, which, with slight interruptions, extend to Murzuk in Fezzan. South of the Hammada of Murzuk is the massif of Zaghron (called the northern zone of the Sahara; it forms a kind of bow, with its extremities respectively at the Libyan and the annual desert and its apex in the south of Tunisia. In the south are the dunes of the Ubara, which extend south of the middle portion of the Gidi, another area between the Ayadagh plateau and the Ahaggar, and a third between Air and Tibesti. The Juf or depressions are, except in rare instances, below sea-level, and the Libyan desert is a vast region of dunes of unaccountable limits; the characteristics of the Libyan desert being thought of as reflecting the whole of the Sahara originated the idea of a "sea of shifting sand" as descriptive of the entire desert. Here a region of over 8000 sq. m. extends to the Tibesti mountains to the valley of the Nile, bounded south by Wadai and D. air, north by Fezzan and the Cyrenaica, appears to be almost entirely sterile and increasingly covered by dunes. There is only one known route through this dreadful wilderness—"one running north and south to the oceans of Kufra, which lie in its centre. The dunes in the Libyan desert, so far as is known, run N.W. and S.S.E. In the Eastern Erg the dunes also lie in long lines in a N.W. and S.S.E. direction, presenting a gradual slope to windward and an abrupt descent to leeward.

Under the influence of the wind the surface of the dunes is subject to considerable change, but in the mass they have attained such a state of comparative uniformity that their topographic distribution may be considered as permanent, and some of them, such as Gern (Peak) al-Shuf and Gern Abd-al-Kader, to the south of Golea, have names of their own. The popular stories about caravans and armies being engulfed in the moving sands are regarded as apocryphal (save perhaps in some instances in the Libyan desert), but there is abundant
evidence against the theory of M. Vatonne as to the dunes having been formed in situ.

Although now mainly waterless, the Sahara possesses the skeleton of a regular river-system. From the north side of the Atakor-n'Grella, which is part of a large and conspicuous depression between the basins of the Mediterranean and Atlantic, begins Wadi Igharghar, which, running northwards between the Tisili plateau and the Tizug mountains, appears to have cut a river-bed of considerable depth, which is traced northwards for hundreds of miles. Its bed contains rolled fragments of lava and freshwater shells (Cyrena and Planorbus). In a line almost parallel to Wadi Igharghar, Wadi Mya descends from the higher ground westwards, while Wadi Essouf, running eastwards from the Tisili plateau, has also fashioned an ancient channel by deep erosion of the Cretaceous rocks, in which a large number of left-hand tributaries also have left their mark. The streams flowing south from the Atlas, which seem to be absorbed in the great basin of the Sahara, have eroded to depths in the bedrock below its surface. Reservoirs or basins capable of being tapped by artesian wells over very extensive areas. As Olympeodorus (quoted by Photius) mentions that the inhabitants of the Sahara used to make excavations from 100 to 120 ft. deep, out of which jets of water rose in columns, it is clear that this state of matters is (historically) of ancient date. Since 1856 French engineers have carried on a series of borings which have resulted in the fertilizing of extensive tracts. In Wadi Righ (otherwise Rhir), which runs for 80 m. towards the south-west of the Shat Melhir (department of Constantine, Algeria), the water-bearing stratum is among permeable sands, which are covered to a depth of 200 ft. by impermeable marls, by which the water is supplied. In Wadi Engadane, which does not appear to have been sunk by the French. Connexions probably exist with subterranean water-supplies in the mountains to the north. In Wadi Issise, which is the water reservoir of the Sahara and is kept aerated by the exit of Wadi Righ, all of which were ejected by the well called Mezer in Wadi Righ. Further west the Wadis Zusafla and Ghar unite to form the Saura, known in Tuat as the Massaouil. These rivers still carry water as far as the Tassili plateau, the course of which is interrupted by was, apparently, S.W. to the eastern Juf. There are also well-marked river-beds in the central Sahara. The Wadi Telmessi, rising in Adrar, of the Iforas, apparently joined the Niger near Gao, which is the course of the Niger inland. It is believed to have been the ancient upper course of the lower Niger. The oases are also proofs of the presence of a steady supply of underground moisture, for vegetation under the Sahara climate (whereby plants specially adapted to desert conditions) is exceptionally thirsty.

The existence of such wadi or river-beds is a factor in the consideration of the cause of the desert nature of the country. In all parts of the Sahara there is evidence of denudation carried out on a scale of unusual magnitude. The present surface of the desert has been exposed to the protracted wear and tear of these agents. But to determine the exact method by which the elements have destroyed the rock and sand, and the power of science. The theory of submarine denudation was accepted by many scientists of the mid-Victorian era. The sand-dunes, the sand-tracts, the sand-caps, the sand-deposits, and the local occurrence of certain modern marine stones are all attributes of a submarine sea. Nor is evidence lacking that in ciretaneous times portions of the Sahara were covered by the sea. Colonel P. L. Montclai brought home (1925) a marine sheep-urchin from Bilma. In 1902 at Tamaske, some 40 m. W. of Zinder, and a little north of Sokoto, a nautili and four sea-urchins (fossils) were found by Captain Gaden in a limestone bed. Similar fossils occur in the region between Zinder and Air, and others of the same age have been found near Dakar. Basing his conclusions on these and other facts, de Laplanche shows, however, that an arm of the sea, extended inland from the Atlantic to the eastern Sahara. This sea was bounded on the north and east by the mountains of Air, Agaghar, the Asier Tarali, &c. An extensive area is denuded of rocks, Sabkha characteristics show, however, that an arm of the sea for the Sahara as a whole is impossible. Henri Schürmer, who in 1893 published an admirable summary of Saharan geography up to that date, argued that the desert nature of the Sahara is due to the accumulation of silt and sand transported by the winds from that direction, which, blowing towards a lower latitude, are in their very nature dry winds. The influence of mountain ranges, such as the Atlas, round the border of the desert, is thus but a small factor. The accumulation of these silt and sand deposits is rapidly diminishing the Delta not exist. This dryness reacts again on the temperature conditions of the Sahara, accentuating both the daily and annual variation. The intense heat of the day is compensated by the cold of the nights, so that the mean annual temperature is not excessive. The difference between the mean temperature of the hottest and coldest month has been found to be as high as 45°F., and the extreme range at least 90°F., maxima of 112° and over having been frequently observed. As a result of the extreme dryness of the air, evaporation is excessive, and, being greater than rainfall, has the effect of reducing the temperature and producing a very considerable fall of temperature. The surface of the rocks, heated by the sun and suddenly chilled by rapid radiation at night, gets fractured and crumbled; elsewhere the cliffs have been scored and the sand thus formed is at once absorbed by the beds. In all such places the sand has become impermeable. In many places it has planed the flat rocks of the hammada as smooth as ice. Elsewhere it has scored the vertical faces of the cliffs with curious imprints of glacial striation, and helped to under-cut the cliffs. These long-continued effects leave the most arid and barren plateau—those, under the name gar, are among the most familiar products of Saharan erosion. The softest quartz rocks of the Quaternary and Cretaceous series have been made to yield the sand which, drifting in vast and restless masses, has formed the desert. The slightest breeze is enough to make the surface “smoke” with dust; and at times the weird singing of the sands, waxing louder and louder, tells the scientific traveller that the motion is not confined to the superficial particles. The dry wind of the Sahara is known in southern Europe as the Sirocco. It brings with it clouds of fine red dust, as noted long since by Idrisi, the Arabian geographer. Dr Theodore Fischer and Dr Oscar Frass agree in believing that the deglaciation has markedly increased in historic times. Evidence derived from ancient monuments combined with the statements of Herodotus and Pliny are held to prove that the elephant, the rhinoceros, and the crocodile existed in North African regions where the environment is now arid, and on the other hand that the camel is a late introduction.

Any attempt to improve the climatic conditions of the Sahara as a whole can hardly meet with success when the causes of its desiccation are so many and so complex. That local conditions can be modified, and fairly satisfactory results have been obtained in the direction of fixing the dunes and covering them with a growth of vegetation. Experiments carried out by the French at Ain Sérir (near Tafilalet), proved the feasibility of the scheme of protecting the sand from the action of the wind by a litter of alfalfa grass, time is given for the establishment of suitable trees, which include the tamarisk, acacia, eucalyptus, prickly pear, peach and apricot, which succeed to the tamarisk and date palms. The intense dryness of the desert conditions. Such planting operations can only be carried out in favourable localities, such as valleys in which a certain amount of water is available. Wide areas like the arid portion of the desert are merely arid in appearance (due to the increase in evaporation).

As already stated, the popular conception of the Sahara as a sand desert is erroneous. It is really a stony, wind-swept waste with much bare rock visible, the actual area of pure sand forming a relatively small portion. A broad belt of Archaean rocks extends throughout the desert, appearing at intervals in the form of hills and plateaux from beneath the superficial sands and Quaternary deposits. Examples are the great sand-dunes of the western coast and the large south-western desert of the Ahaggar plateau. Flooding this zone are immense tracts occupied by rocks of Devonian and Carboniferous age, from which characteristic marine fossils have been obtained at the springs of EI Aoued and Benhassen, and by the Aptian sandstone and chalks of the African system of the Ahaggar plateau. At the close of the Carboniferous period it has been generally considered that the southern and central Sahara became dry land and has remained so up to the present day. Marine fossils of Cretaceous and Pliocene, however, have been found within recent years in the central regions; while Eocene echinoids have been obtained near Sokoto (Geol. Mag., 1904). During Lower Cretaceous times the Mediterranean covered the Libyan and Tripolitan Sahara and the northern portion of the eastern desert; the extensive development of the Cretaceous system being one of the most striking features of Saharan geology. At the close of the Cretaceous period the Tripolitan Sahara completely subsided into the sea, and the sediments have remained below sea-level until the end of the Lower Eocene.

Only on the extreme borders of the desert, however, do secondary formations play any prominent part. During the Quaternary period the desert has been described as extending from an arm of the sea to the Great Maghreb, being bordered by the Sahara. This is shown by the numerous water-cut valleys, now dry, and by the remains of hippopotamus in the Quaternary deposits. The idea so long held that the Sahara represented the recently drained bed of an ocean was discredited by the investigations of French geologists. The sand is mainly derived from the wide expanse of Cretaceous sandstones, which become rapidly disintegrated by the contraction caused by the drying of the air, and descend to the desert in vast masses. The reddish yellow (from the presence of iron), they have in the mass a rich golden hue. According to Tissandier animal organisms, such as the microscopic shells of Rhizopoda, abundant in sea-sand, are nowhere absent. Botanically the Sahara is the meeting-ground of representative...
of the "Mediterranean" and the "Tropical" floras which have accommodated themselves to the peculiar climatic conditions. The line of demarcation between the two floral areas, almost coinciding in the west with the Tropic of Cancer and in the east with the Tropic of Capricorn (or Lake Chad) influences. By far the greater portion of the area to "Mediterranean" uniformity, in spite of differences of altitude and soil, is a general characteristic of the vegetation, which outside of the Sahara forms a bed of plants. A dry, still habit of growth. The oases are the special home of the date-palm, of which there are about 4,000,000 in the Algerian oases alone. In company with this tree, with which life in the Sahara would be practically impossible, are grown apples, oranges, citrons, figs, pomegranates, &c. From December to March wheat, barley and other northern grain crops are successfully cultivated, and in the hotter season rice, dhukhn, durra and other tropical products. Altogether these crops constitute the "oasis"; forty-eight of these are known from the Kufra group, forty-eight from the Aujila group. Zoologically the Sahara is also partly Mediterranean, partly Tropical. Apart from the domestic animals (camels, asses, &c.), and the innumerable black bees (Awelle in Kanuri), the list of fifteen mammals comprises the jerboa, the fennec or fox, the jackal, the sand rat (Psammomys obesus), the hare, the wild ass and three species of antelopes. In Borku, Air, &c., baboons, hyaenas and mountain sheep are not uncommon. Without counting migratory visitors, about eighty species of birds have been registered—the ostrich, the Certhilauda deserti or desert-lark (which often surprises the traveller with its song), Emberiza saharae, three species of Dromes, larks, gazelles, geckos, &c. Among the fish, one of fifteen different species were collected by the single Rohls expedition of 1873-1874; the serpents comprise the horned viper, Psammophis stibialis, Coluber lacerina, the python and several other species. Of the reptiles, Cynocnemis, a ratfish not unlike Cyprinodon carbonarius, is found in all the brackish waters of north Sahara and swarms in the lake of the Siwa oasis. The chief centres of population in the Sahara are, firstly, the oases, which occupy positions where the underground water makes its way to the surface or is readily reached by boring; and, secondly, certain mountainous districts where the atmospheric moisture is condensed, and a moderate rainfall is the result. Except in the south of Algeria, which is at present only sparsely inhabited, all the desert is made up of sandy deserts. The condition of the Sahara oases is far from prosperous. Prior to the French occupation, a feeling of insecurity had been engendered by the marauding habits of the nomad tribes; cultivation had become more restricted; and the decline of the caravan trade had brought ruin to certain centres, such as Murzuk. The most important are the oases of the Tuat region, especially Insala; those of Ghat and Ghadamis on the route from Tripoli to Zinder; and of Kufra, in eastern Sahara (see Tuat and Tripoli). The various confederations of the Tuareg, in the central Sahara, are grouped round hilly districts. The most important are the Awelli-miden, on the left bank of the Middle Niger; and the Kel-Ul, grouped around the mountainous districts of Air or Asben; the two northern confederations, those of the Ahaggar and Asjer, being less powerful. Much of the history of the Sahara has been written by the nomads. The story of the Tuareg, in 1896, of Lieutenant Hourst of the French Navy, who was much struck with its powerful organization under the chief Madini. Northwest of Timbuktu in the district or "Kingdom" of Biru is the oasis and town of Walata, a Tuareg settlement. Other mountainous districts in which a certain amount of rain falls regularly, and which contain a population above the average for the Sahara, are Tibesti and Borku, in the east centre, and Adrar in the west. Tibesti and Borku are populated by Tibbou; the western Adrar by Moors (Berbers). The northern portions of the Sahara are inhabited by nomad Arabs. Attempts have been made by many explorers and writers to trace in certain of the existing inhabitants the remnants of an aboriginal race of negro affinities, which inhabited the Sahara before the arrival of the Berbers and Arabs. Botany and Zoology. E. F. Gautier, writing in 1898, maintained that the evidence available (for the central Sahara) rendered probable the hypothesis that at a period perhaps as recent as the Roman conquest of North Africa the Sahara was still neolithic and peopled by a race of agricultural negroes, who extended to the confines of Algeria. Negro influence is undoubtedly seen in various parts of the Sahara, but it may date from a much more recent period than has been supposed. For example, the connexion between many of the place-names in Fezzan and the language of Bornu is attributable to the northward extension of the influence of the Bornu-Kanem empire between the 11th and 14th centuries A.D. The allusions by classical writers to Ethiopians as inhabitants of the Sahara prove little, in view of the very vague and general meaning attached to the word. The physical characteristics, and especially the dark colour, of many of the Saharan populations is apparently a stronger argument, but even this is capable of another explanation. Caravans of negro slaves from time immemorial passed northwards along the main desert routes, and it is just in the oases on these routes that the dark element in the population is chiefly found. It may therefore be attributed to the intermarriage of the original lighter inhabitants of the oases with such slaves. The Tibbu (q.v.) or Telbu, once thought to be almost pure negroes, proved, when examined by Gustav Nachtigal in Tibesti, to be as pure a negro as anything could be. The commerce of the Sahara is not inconsiderable. Among the more important trade routes are (1) from Morocco to Cairo by Inisalat and Ghadamis, which is followed by the pilgrims of western Africa bound for Mecca; this route has been largely superseded by the sea route from Tangier to Alexandria; (2) from Kuka (Lake Chad) to Murzuk and Tripoli; (3) from Kano and Zinder to Tripoli by Air and Ghat; (4) from Timbuktu to Inisalat, Ghadamis and Tripoli; (5) from Timbuktu to Inisalat, Ghadamis and Tripoli; (6) from Timbuktu to the Niger; (7) from Timbuktu to Morocco. The Senussi movement brought into prominence the desert routes between Wadai in the south and Jalo and Benghaz in the north, which partially superseded some of the older routes. Other causes tended to reduce the importance of the old routes. The long-established route from Darfur to the Kharga and Dakhilla oases fell into disuse on the closing of the eastern Sudan by the Mahdist troubles. The great route leading from Tripoli via Ghadamis and Ghat, to Zinder, Kano, and other great centres of the Hausa States maintains its importance, but the opening of trade from the side of the Niger by the British in the early years of the 20th century affected its value. The route across the western Sahara to Timbuktu is less used than formerly owing to the establishment of the French by a route from Senegal via Ntagha to the Upper Niger, which contains minor wear and tear. This determines to some extent the salt trade from the Sahara, which centres at Timbuktu. Salt and date palms are the chief products of the Sahara. The principal sources of the salt supply are the rock-salt deposits of the Juf (especially Taudeni), the lakes of Kufra and the rock salt and brine of Blima (q.v.). The hope of an eventual commercial exploitation of the Sahara rests mainly on the possible existence of mineral wealth. To supply the European communications with mineral wealth, the construction of a railway across the desert has found many advocates. Two principal routes have been suggested, the one taking an easterly line from Biskra through Warga to the Tuareg country, and the other taking the route followed by Foroue (see below); the other starting from the terminus of the most westerly railway already existing, and reaching Timbuktu via Igli and the Tuat oases. A third suggested route is one from Igli to the Senegal, still farther west. Reference may also be made to the proposal, strenuously advocated between 1870 and 1885, to open up the region to the south of Algeria and Tunisia by the construction of an inland sea. According to Colonel Francois Roudaire, such a scheme would have involved the extension of the Sahara," it was possible to create an inland sea with an average depth of 78 ft. and an area of 3,000 sq. m., or about fourteen times the area of Lake Geneva. A French government commission concluded that the excavation of the necessary canal would not be difficult, and that in spite of siltation processes the canal when cut would at least last 1,000 to 1,500 years. Ferdinand de Lesseps, Roudaire's principal supporter, wrote in 1885 and reported that the canal would cost five years' labour and 150,000,000 francs. The scheme (which fell into abeyance on the
death of Roudaire) was based on the following facts. The Gulf of Gabes is separated by a ridge 13 m. across and 150 ft. high from Shat-al Fejej, a depression which extends S.W. into the Shat Jerid, which in its turn is separated from the Shat Kharsa only by a still narrower ridge. Shat Gabes is succeeded westwards by a series of smaller depressions, and beyond them lies the Shat Meltrir, whose N.W. end is not far from the town of Biskra.

Politically the Sahara belongs partly to Morocco (Tafilet, &c., partly to the Tunisian Empire (Trippolitania, &c.), but principally to France. The French first acquired an interest in the Sahara by their conquest of Algiers (1830–45). They gradually extended their influence southward with the object of keeping themselves in possession of the country. The acquisition of Tunisia (1881) largely increased the hold of the French on the Sahara, and the work of French pioneers to the south of Algeria was recognized by the Anglo-French agreement of 1890, which fixed the limits of the Sahara from Algeria to a line from Say on the Niger to Lake Chad. The southern limit of the territory was, however, not strictly defined until 1898, when a new agreement gave to France a rectangular block south of the line mentioned, including the important frontier town of Zinder. A further agreement in 1901 again modified the frontier between France and Germany.

To the north-east and south the boundary of the Sahara was extended, by an Anglo-French Declaration of March 1899, and defined as running south-east, from the intersection of the Tropic of Cancer with 16° E., until it meets the meridian of 24° E., following this south to the frontier of Darfur. French Sahara is thus connected with the French possessions in West Africa and with the Congo-Shari territories of France on the south-east. On the west, occupied by the French, and with the Spanish regions of the Sahara, the inland frontier was defined by the Franco-Spanish agreement of 1900, whereby Spain was apportioned a Hinterland with an average depth of 240 m. from the sea-shore.

It is impossible to ascertain the extent of the knowledge of the Sahara possessed by the ancients. The Egyptians penetrated the Libyan and Nubian deserts at points, and CARTHAGINIANS and PHOENICIANS were acquainted with the northern fringe of the desert in the west. European exploration dates from the 19th century. In 1810 Captain G. F. Lyon and Joseph Ritchie penetrated from Tripoli to Murzuk, where Ritchie died. In 1822 came the great journey of Walter Oudney, Hugh Clapperton and Dixon Denham, from Tripoli to Lake Chad, and a year or two later Major A. G. Laing succeeded in reaching Timbuktu. In 1830 Laing crossed from Timbuktu to Morocco. Heinrich Barth in the course of his great journey (1840–1856), commenced from Tripoli under the leadership of James Richardson, traversed a considerable portion of the Sahara. Between 1850 and 1861 Henri Duveyrier, explored parts of the Tuareg domain. Knowledge of the northern Sahara, from Morocco to Tripoli, was largely increased by the journeys of Gerhard Rohls, begun in 1861; Rohls subsequently crossing (1866) from Tripoli to Lake Chad by nearly the same route as that previously taken by Barth. In 1873–1874 Rohls visited the oases in the north of the Libyan desert and in 1878–1879 reached the oasis of Kufras. In 1876–1877 another German traveller, Erwin von Bary, made his way to Ghat and Air, but was assassinated. A French expedition under Colonel Paul Flatters after penetrating far south of Algeria was massacred (1881) by Tuareg. Farther west success was attained in 1880 by a German explorer, Dr Oskar Lenz, who, starting from Morocco, reached the oasis of Timbuktu, also by a new route, in 1892. In 1892 the Sahara was crossed from Lake Chad to Tripoli by the French Colonies of the Sahara.

It was not until 1890 that the central Sahara, from Algeria to Air, was traversed for the first time by Europeans. This was accomplished under the leadership of Fernand Foureau. This journey was undertaken in pursuance of the efforts of the French to obtain effective control of the Sahara. South of Algeria military posts had been gradually pushed into the desert, Golea being until 1900 the farthest point which acknowledged French rule. The great desideratum was the opening up of a route to the Niger countries which might in time divert the trade from Tripoli to Algeria, but all attempts long proved fruitless, owing to the opposition of the tribes inhabiting central Sahara. In 1886 Lieutenant Palat was murdered a little south of Guara, and in 1880 the same fate befell Camille Douls in Tidikelt (Tuat) in his attempt to reach Timbuktu from the north. In 1890 Foureau—who in 1883 had undertaken a first journey of exploration south of Wargla—reached the Tademayt plateau in 28° N., fixing the position of 35 places, and in 1892–1893 came the first of his long series of expeditions undertaken with the object of penetrating the country of the Azher Tuareg, the powerful confederacy which lay on the route to Air and Lake Chad, never traversed in its entirety by a European. All efforts to obtain a passage were unavailing until in 1898–1899 Foureau, accompanied by an escort of troops under Major Lamy, at last attained his object, finally reaching Zinder, the important trade centre on the borders of Nigeria, and midway between the river Niger and Lake Chad, on the 2nd of November 1899.

The important section of Foureau’s route began at Ain El-Hajaj, in about 26½° N., immediately beyond which the winding massif of Tindessat had to be crossed by a most difficult route among a series of rocks and ravines, the geological formation being the flat-topped sandstone. After descending the southern escarpment of the “Tasili,” the expedition crossed the mountainous region named Anahel, composed of quartz and granite, through which the line of division between the Sahara and Sud (South African and Atlantic) was found. Thence the route lay across the wide plain of quartz gravel, strewn with blocks of granite, known to the Tuareg as Timiri, to the well of In-Zaazua, beyond which a march of eleven days, with a water-supply at one point only, led to the first village of Air, where the Tuareg proved hostile. Agades, the capital of Air, was reached by a march through difficult mountains, with valleys which gradually opened into a wide plain. From Agades to the town of Timbuktu, the Tuareg, with their fixed and active Zaazua; next, through the bush-covered Tagama, a district abounding in game; and, lastly, through the cultivated country of Damergu, Zinder had only once before been reached by way of Air—by Barth in 1861. An expedition in 1856, under the command of the French force which had advanced from the Niger (see SENEGAL: Colonial). Foureau’s achievement was quickly followed by increased political activity of the French in the Sahara south of Algeria, where, in addition to the work of other explorers, surveys had been carried by French officers (especially Captains Germain and Laperrine in 1869) as far as the important centre of Inislah, the position of which had, as a result, been shifted some 25 m. E. of its former position on the map, being found to lie in 2° 16’ E., 20° 17’ 30’ N. Early in 1900 G. B. M. Flamand, who had been entrusted with a scientific mission to the Tuat oases, came into collision with the natives, and Inislah was occupied by the military escort which accompanied him. This was quickly followed by the occupation of Tuat, and Iglé (see Tuat).

Simultaneously with these events, an attempt was made to pave the way for the establishment of French influence in western Sahara by the expedition of Paul Blanchet to Adrar, which had not been visited since the middle of the 19th century. It returned in September 1900, only partially successful, Blanchet and his companions having been driven by the Tuareg from their virtual imprisonment on the borders of Adrar. The leader almost immediately succumbed to fever. In 1903–1909 the country N. of the lower Senegal, including Adrar, was brought under French control and organized as the territory of Mauretania.

The most marked progress was, however, effected in the central Sahara, where the French posts were gradually pushed farther south under a military organization, which resulted in the complete pacification of the Tuareg countries. Travel was thus made possible from one border of the desert to the other, and a number of successful expeditions gathered a rich harvest of results respecting the mapping, geography, and other features of this part of the Sahara. Some of the best work was done by Laperrine, Arnaud, Cortier and Nieger on the military side, and, on the civilian, by Villatte, Gautier and Chudeau. Apart from these French enterprises, Hanns Vischer, a Swiss in the service of British Nigeria, in 1906 travelled from Tripoli to Bornu through Murzuk and Bilma. In 1910 Capt. A. H. Haywood traversed the Sahara, being the first Englishman to cross the desert from Gao to Inislah.
SAHARANPUR—SAIQA

SAHARANPUR, a city and district of British India, in the Meerut division of the United Provinces. The city is situated on a stream called the Damaula Nadi, 907 ft. above sea-level, 908 m. by rail from Calcutta. Pop. (1901) 66,254, of whom more than half are Mahomedans. It is an important junction of the North-Western railway with the Oudh and Rohilkhand line. The government botanical gardens were established in 1817. There are railway workshops, and a large industry is pursued in wood-carving.

The District of Saharanpur has an area of 2228 sq. m. It forms the most northerly portion of the Doab, or alluvial tableland between the Ganges and Jumna. The Siwalik hills rise precipitously on its northern front; at their base stretches a wild submontane tract, with much forest and jungle. Cultivation generally in this part is backward, the surface of the country being broken by ravines. South of this tract lies the broad alluvial plain of the Doab, with fertile soil and good natural water-supply. This portion of the country is divided into parallel tracts by numerous streams from the Siwaliks, while the Eastern Jumna and Ganges canals cover the district with a network of irrigation channels. The annual rainfall averages about 37 in. The population in 1901 was 1,045,230, showing an increase of 4.4% in the decade. The principal crops are wheat, rice, pulse, millet, and maize, with some sugar-cane and cotton. The district contains the towns of Roorkee and Hardwar.

The disturbances of the years 1857, and of the following years, required the considerable expenditure of the inhabitants, but in 1873 the district under Ghulam Kadir enjoyed comparative tranquillity. On his death the country fell into the hands of the Mahattars. It was afterwards again overrun by the Sikhs, remaining practically in their hands until their defeat at Charon November 1840, when it passed under British rule. Several disturbances subsequently took place among the native chiefs; but from 1824 to 1857 nothing occurred to disturb the peace of the district. The Mutiny in this part was soon quelled.

SAHEL (Arabic for "shore"); a common place-name in countries where Arabic is the dominant language. By sahel any coast belt may be indicated, but the name has become the definite designation of certain districts, e.g. the Tunisian coast between the gulf of Hammamet and Gabes. Another region so called is that part of the Sahara washed by the Atlantic. The name is also used to designate the territory under French jurisdiction west of Timbuktu and north of the Senegal. Sahel thus understood comprises regions which form the inter-

mediate zone between the fertile lands of the Sudan and the desert. In its plural form, Swahili, the word has become the tribal name of the natives inhabiting the coast strip opposite Zanzibar.

SAHIB, a title of respect in India, specially used to designate Europeans. The word is Arabic, and originally means a companion. It is generically fixed to the titles of men of rank, as Khan Sahib, Nawab Sahib, Raja Sahib, and is equivalent to master. The proper feminine form is sahiba; but the hybrid term memsahib (from madam and sahib) is universally in use in India for European ladies.

SAHOS, or Souros, Africans of Hamitic stock living to the W. of Massawa. Some authorities regard them as true Abyssinians, but more probably they are akin to the Gallas and Afars. They are for the most part Mahomedans, but some few are Christians.

SAHYADRI, a mountain range of India. The term, which is Sanskrit rather than vernacular, is applied to the entire system of the Western Ghats (q.v.) from the Tapti river to Cape Comorin, but more especially to that part of the system in the Bombay Presidency. In this restricted sense the Sahyadri hills begin in Khandesh district, and run S. as far as Goa.

In the territory of the Nizam of Hyderabad, the cross range forming the watershed between the river systems of the Tapti and the Godavari, is locally known as Sahyadri Parbat.

SAIDAPET, a town of British India, administrative headquarters of Chingleput district, Madras, on the South Indian railway, 5 m. S.W. of Madras city, from which it is separated by a line of tanks. Pop. (1901) 14,254. The government teachers' college has a hostel or boarding-house for Brahmins, opened in 1897. The agricultural college, originally (1865) a model farm, has been transferred to Coimbatore.

SAID PASHA (c. 1830-1907), surnamed KURNUK, Turkish statesman, was at one time editor of the Turkish newspaper *Jerid-i-Havadi*. He first became secretary to Sultan Abd-ul-Hamid II. shortly after his accession, and is said to have contributed to the realizations of his majesty's design of concentrating power in his own hands; later he became successively minister of the interior and Vali of Brusa, reaching the high post of grand vizier in 1879. A Turkish statesman of the old school, he was regarded as somewhat bigoted and opposed to the extension of foreign influence in Turkey. He was grand vizier four more times under Abd-ul-Hamid. In 1896 he took refuge at the British embassy at Constantinople, and, though then assured of his personal liberty and safety, remained practically a prisoner in his own house. He came into temporary prominence again during the revolution of 1908. On the 22nd of July he succeeded Ferid Pasha as grand vizier, but on the 6th of August was replaced by Kaimil Pasha, a man of more liberal views, at the instance of the young Turkish committee.

SAID PASHA KURD (1834-1907), Turkish statesman, son of Hussein Pasha, was born at Suleimanié. After holding various administrative posts he became governor-general of the Archipelago (1881), minister for foreign affairs (1882), ambassador at Berlin (1883) and again foreign minister in 1885. He was afterwards president of the Council of State, an office which he held till his death on the 29th of October 1907.

SAIQA (Saiqa tatarica), the native designation of a desert-dwelling antelope, easily recognized by its extraordinary swollen and puffy nose, in which the apertures of the tubular nostrils are directed downwards. The ringed lyrate horns of the males are amber-coloured, and wide apart on the head. There is a small gland on each side of the face below the eye; and the ears are remarkable for their short and rounded form. The colour is whitish in winter and sandy in summer. It is the sole representative of its genus. At the present day the headquarters of this antelope are the Kirghiz Steppes, but a century ago its range extended as far west as Poland. During the latter part of the Tertiary period the saiga was much more widely distributed, fossilized remains having been obtained from many parts of Western Europe, including Britain.
SAIGO, SAILCLOTH

SAIGO, TAKAMORI (1832–1877), Japanese patriot, was born in Satsuma in 1832. From early youth he took a prominent part in the politics of his clan, and owing to his extreme opinions with regard to the expediency of abolishing the Tokugawa administration, he was banished (1858) to the island of Oshima (Satsuma), where he attempted unsuccessfully to commit suicide. Ultimately he rose to high rank in the newly organized imperial government, but in 1873 he retired from the cabinet by way of protest against its decision not to take armed action against Korea. Thenceforth he became the rallying point of a large number of men dissatisfied with the new administration, and in 1877 he headed a rebellion which taxed all the resources of the central government. After several months of desperate fighting, Saigo and a small remnant of his followers made a swift retreat to Kagoshima, and fell fighting (September 14) within sight of their homes. Saigo's patriotism and his great services in the cause of the restoration of the administrative power to the throne were so fully recognized that his son was raised to the peerage with the title of marquess, and his own memory was honoured by the erection of a bronze statue in Tokyo.

SAIGON, a town of French Indo-China, capital of the colony of Cochin-China, at the mouth of the river Saigon, 34 m. from the sea. Pop. (1906) 54,745, of whom 8,494 were French (exclusive of troops). 1,52 European and other nationalities, about 30,000 Annamese, 14,000 Chinese. The town is enclosed by the river Saigon on the east, the Chinese Arroyo on the south, and the Arroyo del Avanche on the north, while on the west it extends towards the neighbouring town of Cholon. Double rows of trees give shade in all the streets, the width and uniformity of which, together with the beautiful gardens (including the zoological gardens), make Saigon one of the finest towns of the Far East. It is lighted chiefly by electricity and its water-supply is secured by a filtering reservoir. The chief public buildings are the government house, the palace of the lieutenant-governor of Cochin-China, the law courts, the theatre, the post-office and the cathedral. The commercial port, at the mouth of the Chinese Arroyo, carries on a large rice trade. The naval harbour comprises an arsenal and has a repairing dock.

Saigon is the seat of two chambers of the court of appeal of French Indo-China, of tribunals of first instance and of commercial courts, and of the vicar apostolic of Cochin-China. Its municipal council consists of eight French and four native members elected by universal suffrage. This body elects a mayor and two assistants.

Before the French conquest, Saigon, then known as Gia-dinh-thanh, was the capital of Lower Cochin-China, which consisted of the six southern provinces of the Annamese empire, and constituted an independent kingdom under the government of a kingloko. In 1836 it was fortified for the emperor Gin Long by Colonel Ollivier. The French captured it in 1859, and it was part of the territory ceded in 1862.

SAIL, the English equivalent of the common Teutonic word for one of the two universal means of propulsion of a vessel through the water, the other being the oar (q.V.). For the various types of sail see RIGGING, and for the textile material used see SAILCLOTH below. The origin of the O. Eng. sein or seel and its cognates, e.g. Dutch sief, Dan. siel, Ger. Segel, &c., is not known; it is certainly not connected with the Lat. sagulum, cloak, mantle. It may be derived from the Indo-European root saik-, seen in Sanskrit sakha, endure, the idea being of that which bears up against or resists the wind.

SAILCLOTH, now more commonly called canvas (q.v.), usually a double warp, single weft fabric of the same structure as bagging (q.v.), although it is sometimes made with single threads of warp. Hemp and ramie are occasionally used in the manufacture of this cloth, but flax and cotton are the chief fibres employed. Many of the sails of fishing smack and similar vessels are made entirely of cotton—the fabric sometimes retaining its natural colour, but more often dyed or stained tan. Since most of the larger vessels are now driven by steam, the quantity of cloth used for sails is comparatively small. A large quantity of cloth, however, is used on steamships for covers and for coal bags, sailcloth buckets, &c.

The very best kind of sailcloth is made from long flax, as this fibre possesses flexibility, lightness and strength combined. The number of threads per inch of warp varies from 14 double threads to 48 double threads, and from 12 to 36 shots per inch of weft, while the usual widths are 18, 24, 30 and 46 in. Cotton canvas has for its limits about 26 to 54 threads of warp per inch, and 15 to 46 shots per inch; the warp yarn for cottons may be 2, 3 or several ply.

Great care has to be exercised in the manufacture of canvas for the British Admiralty. The yarns must be made wholly from long flax, well and evenly spun, and properly twisted. They must also be free from blacks, and be twice boiled in order to remove all injurious matter. From the grey state to the cleaned state the yarns must lose 10% of weight, and no deleterious substance whatever must be used in any stage. The mill washing and first boiling reduce the weight about 8% while about 2% is removed during the second boiling. Finally, the yarn is thoroughly washed to remove all traces of alkali. The successive processes which the yarn is subjected to remove all imperfections, and leave the yarn in the best condition for weaving. Canvas is made in seventeen different qualities: the heaviest is No. 0000, then follow Nos. 0 to 9, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 and 12. Of these sixteen varieties Nos. 10 to 16 are mostly in use. Nos. 1, 2, 4, 6 and 7 are used for royal navy canvas, and Nos. 4 and 6 for the merchant navy. The canvas for the Admiralty is 24 in. wide, and the pieces, termed bolts, should be as nearly as practicable 40 yds. of legal measure in length, and to be completely manufactured—particular attention being given to the weaving; the selvages to be evenly and well manufactured, the thorn to be left on each end of the bolt, and to be made as nearly as possible in the proportion of weights given below.

The breaking tests for red and grey canvas are 5% below those for white canvas.

Sailmaking is a very ancient industry, but it is, naturally, much less important than it was before the introduction of steamships. The operations of the sailmaker may be stated as follows. The dimensions of mast and yards and sail plan being supplied, the master-sailmaker is enabled to determine the dimensions of each sail—after due allowance for stretching—in terms of cloths and depth in yards—if a square sail, the number of cloths in the head, number in the foot and the depth in yards; if a fore-and-aft sail (triangular), the number of cloths in the foot and the depth in yards of the luff or stay and of leech or after-leech; if a fore-and aft sail (trapezium form), the number of cloths in the head, number in foot, and the depth of mast or luff and of after-leech. These figures being obtained, there is got out what is technically termed a "casting," which simply means the shape, length, and weight of each individual cloth in the sail. These figures are given to the cutter, who proceeds to cut out the sail cloth by cloth in consecutive order, numbering them 1, 2, 3, 4, &c.; the series of cloths thus cut out are handed over to the louter, who joins the together carefully and fully made double flat seams, sewn with twine specially prepared for the purpose, with about 120 stitches in a yard. In the heavy

Given the dimensions of the sail, the sailmaker can then proceed to cut out the sail cloth, which he unfolds on the table, and the sailmaker then proceeds to fold the sail, sew it, and enlarge the hemming, so to speak, is turned in and finished off with about 72
SAINFOIN—SAINT

The indescribable pods or legumes are flattened from side to side, wrinkled, somewhat sickle-shaped and arced, and contain a sainfoin, olive-brown seed shaped like a small bean. In Great Britain the plant is a native of the calcareous districts of the southern counties, but elsewhere it is considered as an escape from cultivation. It is native throughout the whole of Central Europe and Siberia; but it does not seem to have been cultivated in Great Britain till 1651, when it was introduced from France or French Flanders, its French name being retained. Alphonse de Candolle (Origin of Cultivated Plants, p. 104) considers that the cultivation of sainfoin originated in the south of France as late perhaps as the 15th century. It is grown as a forage plant, being especially well adapted for dry limestone soils. It has about the same nutritive value as lucerne, and is esteemed for milk cattle and for sheep in winter. Besides the common form, a second known as giant sainfoin is met with in cultivation, being more rapid in its growth.

SAINT (lat. sanctus, "holy"), the term originally applied, e.g., in the New Testament and in the most ancient monuments of Christian thought, to all believers. In this sense it is still used by those modern Christian sects which profess to base their polity on the Bible only (e.g., the Church of the Latter Day Saints). An ancient inscription, it often names those souls who are enjoying eternal happiness, or the martyrs. Thus we find inscriptions in the Catacombs such as "sanctus, refugio cum spiritu sancto, and people were buried ad sanctos. For a long time, too, sanctus was an official title, particularly reserved for bishops (v. Analecta Bullioniana, xviii. 410-411). It was not till almost the 6th century that the word became a title of honour specially given to the dead whose cult was publicly celebrated in the churches. It was to the martyrs that the Church first began to pay special honour. We find traces of this in the 2nd half of the 2nd century, in the Martyrium Polycarpi (xviii. 3) in connexion with a meeting to celebrate the anniversary of the martyr's death. Another passage in the same document (xvii. 3) shows clearly that this was not an innovation, but a custom already established among the Christians. It does not follow that it was henceforth universal. The Church of Rome does not seem to have inscribed in its calendar its martyrs of an earlier date than the 3rd century. The essential form of the cult of the martyrs was that of the honours paid to them in the service of a perpetual anniversary by the community. They consisted in a gathering at the martyr's tomb on the anniversary of his death. St Cyprian, speaking of the confessors who died in prison, wrote to his priests: "Denique et dies ejus, quibus excedunt, adnate, ut commemorations ejus memoriae martyrum celebrem possimus" (Epist. xii. 2). The list of anniversaries of a church formed its Martyrology (q.v.). In the early days each church confined itself to celebrating its own martyrs; but it was not long before it became customary to celebrate the anniversaries of martyrs of other churches. In the oldest Roman ferial we already find festivals of Carthaginian martyrs, and similarly, in the Cattlinian calendar, Roman festivals, while Wright's Syriac Martyrology contains numerous traces of this exchange of festivals. From the 5th century onwards certain celebrated saints were honoured almost universally; St Augustine (Sermo, 276, § 4) says that the festival of St Vincent was celebrated throughout the whole of the Christian world. The same was the case of the festivals of St Stephen, St James and St John, and St Peter and St Paul. As a rule the liturgical books or the church calendars of these festivals were held in connexion with that of Christmas (26th, 27th and 28th December), and were not strictly speaking anniversaries. The calendars at first included only martyrs, but their scope was gradually widened. The first to find a place in them were the bishops. Apparently they were at first arranged in a series of anniversaries separate from that of the martyrs, as seems to be shown by the lists of festival days[2] included in the Deposito martyrum; the two lists seem to have been combined, as in the calendar of Carthage, which includes the dies natalicioer martyrum et depositiones episcoporum. Some of the most famous bishops also ended by passing from one calendar into the other. Finally, the ascetics came to share in the honours paid to the martyrs, and we see in the Historia religiosa of Theodoret how quickly this

For seaming and roping to fit the hand, made of hide lined with leather, a plate properly tempered being fixed in it, having chambers to catch the head of the needle, thus acting as a thimble; needles of various sizes, that for seaming being the smallest; and fids splicing, serving and stretching knife, rubber, sail-hook, bobbin for twine, and sundry small articles. (T. Wo.)

SAINFON (Onobrychis sativa) in botany is a low-growing perennial plant with a woody rootstock, whence proceed the stems, which are covered with fine hairs and with long pinnate leaves, the segments of which are elliptic. The flowers are borne in low pyramidal or cylindrical clusters on the end of long stalks. Each flower is about half an inch in length with lanceolate calyx-teeth shorter than the corolla, which latter is papilionaceous, pink, with darker stripes of the same colour.
assimilation took place. In times of persecution the martyrs were buried among the rest of the faithful, but one can understand that their tombs, at which gatherings took place at least on the day of their anniversary, were distinguished from the ordinary tombs by some sign of reverence. The name of a martyr was also enshrined in chapels and often in sumptuous basilicas. In the West these buildings were raised over the tomb, which was left intact; but in the East there was no hesitation in disturbing the graves of the saints, and the bones were laid to a basilica built to receive them. It is in this way that the relics of St Babylas were placed in the sanctuary built by Gallus at Daphne (Socrates, Hist. eccl. iii. 18; Sozomen, Hist. eccl. v. 16). As a matter of fact, the discipline of the Eastern churches with regard to the tombs was from the beginning, much less severe than that of Rome and a great number of the Western churches. From the 4th century on are recorded cases of translation of the bodies of saints, and they did not even shudder when the sacred relics were placed in the shrine already laid down by St Gregory the Great in his letter to Constantia, namely that of not disturbing the bodies of the saints, was for a long time the rule in all cases, and the portions distributed to the churches were considered as left in the tomb of the saint, or, in other words, representative relics. But as early as the 7th century there is proof of a relaxation of this rule which had so well safeguarded the authenticity of the relics. It was finally disregarded altogether; in the 9th century translations of relics were extremely frequent, and led to inextricable confusion in the future.

As to the belief in the efficacy of the prayers of the saints for those still living on earth, and similarly in the efficacy of the prayers addressed to the saints, St Cyril of Jerusalem indicates in the following words the advantages of the commemoration of the saints: "Then we make mention also of those who have fallen asleep before us, first of patriarchs, prophets, apostles, martyrs, that God would at their prayers and intercessions receive our supplication" (Cat. Myst. v. 6). It is difficult to understand a much-discussed passage of Origen (de anima 14). Does he mean prayers addressed to the saints? The Fathers of the 4th century, and notably the Cappadocian Fathers, provide us with a quantity of evidence on this subject, which leaves no doubt as to the practice of the invocation of saints, nor of the complete approval with which it was viewed. St Basil, for example, says: "I accept also the holy apostles, prophets and martyrs, and I call upon them for their intercession to God, that by them, that is by their mediation, the good God may be propitious to me, and that I may be granted redemption for my offences" (Epist. 360).

The cult of the saints early met with opposition, in answer to which the Church Fathers had to defend its lawfulness and explain its meaning in its laudatory sense. St John Chrysostom does not hesitate to warn the faithful against this cult in this matter with regard to St Polycarp: "We worship Christ, as the Son of God; as to the martyrs, we love them as the disciples and imitators of the Lord" (Martirium Polycarpi, xviii. 3). St Cyril of Jerusalem shows the tenacity with which he clung to the faith and the Dogma of the Incarnation: St Asterius and Theodoret against the pagans in general, and they all lay emphasis on the fact that the saints are not looked upon as gods by the Christians, and that the honours paid to them are confined to the faithful in particular. They are only considered as intercessors with God, and not as gods. St Jerome argued against Vigilantius with his accustomed vehemence, and especially meets the objection based on the resemblance between these rites and those of the pagans. It is in all the 1st Augustinians who in his refection on Faustus, as well as in his sermons and elsewhere, clearly defined the true character of the honours paid to the saints: "Non eis templa, non eis altarum, non sacrificia exhibebimus. Non eis sacerdotes offerent, absit, Deus praehac in altariis et oratione invitatur, et non si deum esse offerimus, non Deo offerimus ... Quoaudis audiisti dici apud memoriam sancti Theogenis: offeri tibi, sancte Theogenis: aut offeri tibi Petre, aut: offero tibi Paule" (Sermo, 273, 7; cf. Contra Faustum, viii. 35). He reproved the use of flowers and incense, which he did not consider as an adoration of the saints, but as a demonstration of the fact that they followed the doctrine of the Roman Church: "That the saints who reign with Christ offer to God their prayers for men; that it is good and useful to invoke them by supplication and to have recourse to their aid in order to obtain from God His benefits through the intercession of the saints" (ibid. 37). St Ambrose and St Jerome, the Vicar and Redeemer (Sess. x. xxv.). At the present day the canonization (q.e.) of saints is reserved in the Roman Church to the sovereign pontiff. The Anglican Church, while still commemorating many of the Catholic saints, has not since the Reformation added any new names to the authoritative list, with the single exception of that of King Charles I., whose "martyrdom" was celebrated by authority from the Restoration until the year 1689.

France, where he continued to act as her secretary. In the same year he was made governor of Jersey, whence he conducted the prince of Wales to Paris. He conceived the idea of ceding the Channel Islands to France as the price of French aid to Charles against the parliament; and in other respects also he meddled with foreign politics, his great influence with the queen being a continual embarrassment to royalist statesmen, especially after the execution of Charles I. When Charles II. went to Breda, Jermy remained in Paris with Henrietta Maria, who persuaded her son to create him earl of St Albans in 1660. Gossip which the historian Hallam accepted as authentic, but which is supported by no real evidence, asserted that Jermy was secretly married to the widow of Charles I. At the Restoration St Albans became lord chamberlain, and received other appointments. He supported the policy of friendship with France, and he contributed largely to the close secret understanding between Charles II. and Louis XIV., being instrumental in arranging the preliminaries of the treaty of Dover in 1660. In 1664 he obtained an act of land in London near St John's Gate, and Jermy Street preserves the memory of his name, and where he built the St Albans' market on a site afterwards cleared for the construction of Regent Street and Waterloo Place. The earl, who was a friend and patron of Abraham Cowley, died in St James's Square, for the building of which he had provided the plan in January 1684. St Albans being unmarried, the earldom became extinct at his death, while the barony of Jermy of St Edmondsbury passed by special remainder, together with his property, to his nephew Thomas Jermy, and after the latter's death to Thomas's brother Henry Baron Dover (q.v.).

ST ALBANS, a city, municipal borough, and market town in the St Albans parliamentary division of Hertfordshire, England, on the main line of the Midland railway and on branches of the London & North-Western and the Great Northern lines, 20 m. N.W. of London. Pop. (1891) 12,958; (1901) 16,019. St Albans is situated on the site of the abbey of a monastery covering the greater part of Essex and Hertfordshire, with small portions of Cambridgeshire, Bedfordshire and Buckinghamshire. The great cathedral, or abbey church, is finely situated on the steep hill, above the small river Ver, on which the central part of the city is placed.

Shortly after the martyrdom of St Alban, probably in 303, a church was built on the spot where he was slain, and in 793 Offa, king of Mercia, who professed to have discovered the relics of the martyr, founded a monastery on the spot. By the 13th century the monastery had become one of the richest and most important houses of that order in the kingdom. The abbots, Ealdred and Ealmer, at the close of the 10th century began to break up the ruins of the old Roman city of Verulamium, and to erect a religious establishment there, but its erection was delayed till the time of William the Conqueror, when Paul of Caen, a relative of Archbishop Lanfranc, was in 1077 appointed abbot. The cathedral at Canterbury as built by Lanfranc was one of the best in the west of a flat breadth, but Paul, adopting the same model for St Albans, built it on a much larger scale. The church was consecrated in 1115, but had been finished some years before. Of the original Norman church the principal portions now remaining are the eastern bays of the nave, the transepts, and the main outlines of the building are still those planned by Paul. It is thus one of the most important specimens of Norman architecture in England, with the special characteristics of the eastern portions of the cloister; but nothing of his work now remains except part of a very beautiful doorway discovered in recent times. About 1200 Abbot John de Cella pulled down the western front and portions of the north and south aisles. He began the erection of the eastern portion of the cloister, and his work was continued by his successor William de Tristamington in a similar manner. In 1257 the eastern portion was pulled down, and between the middle of the 13th and the beginning of the 14th century a sanctuary, ante-chapel and lady chapel were added, all remarkably fine. The main part of the existing structure is the eastern bays of the south aisle, the eastern portion of the tower, the gallery, and the columns on the south side suddenly fell, and this necessitated the rebuilding of five bays of the south aisle and the Norman cloisters. Various incongruous additions were made during the Perpendicular period, and much damage was a Southgate door; but dissolution of the abbeys to the finer work in the interior. Structural dangers gave rise to an extensive restoration and partial rebuilding, begun under the direction of Sir Gilbert Scott, and completed in 1894 by Lord Grimthorpe, some of whose work was, and remains, the subject of much adverse criticism. The abbey's extreme length outside is 550 ft., which is exceeded by Winchester by 6 ft. The nave (202 ft.) is the longest Gothic nave in the world and exceeds that of Winchester in length by 20 ft. The transept is 175 ft. inside. The monastic buildings have all disappeared except the abbey, St Michael's church, within the site of Verulamium, was originally constructed in the 10th century. Considerable portions of the church building remain, from which contains the tomb of Lord Chancellor Bacon. St Stephen's church, in the same period, contains some good examples of Norman architecture.

St Peter's church has been in great part rebuilt, but the Early Perpendicular nave remains. The restored clock-house in the market-place (1394) is one of the finest in England. There is an Edward VI. grammar school. The principal modern buildings are the corn exchange, the court-house, the prison, the public baths, a technical school and the public library. There are two hospitals built by Wills, one a dispensary added almost simultaneously in 1734 by Sarah, duchess of Marlborough. The principal industries are the manufacture of silk, straw-plaiting, brush-making, letterpress and chromo-lithographic printing. There are also breweries and iron-foundries. The public park of 24 acres was opened in 1804, and a recreation ground in 1898. The increase in population is largely due to the growth of a residential district on the outskirts, owing mainly to the convenient proximity to London. The city is governed by a mayor, 4 burgesses, and 23 aldermen.

To the south-west of the present city of St Albans stood the ancient Verulamium (q.v.), one of the oldest towns in Britain, on Watling Street. The ruins served as a quarry not only to the builders of the Abbey, but also for the other churches and the monastic buildings of St Albans, and Roman bricks are found even in the fabric of the churches of neighbouring villages, as at Sandridge, 2½ m. N.E. After being burnt by Boadicea, Verulamium revived, and its church was famous early in the 8th century. The origin of the royal capital of Kingsbury is variously assigned to the 6th and 8th centuries. In the 9th and 10th centuries the abbots enlarged the town, which was confirmed to them as a borough by Henry II. In 1253 a charter gave borough jurisdiction to the good men of St Albans; but the borough charters were, apparently, discontinued for about 200 years after the reformation. A charter of 1553, confirmed in 1555 and 1559-1560, incorporated the mayor and burgesses. Charters of 1661, 1664 and 1685, and the Municipal Corporations Act of 1835, altered the form of the corporation; and in 1877 St Albans became a city. Two boroughs were returned to the parliament of 1306-1307, and to others, until, after 1336, such right fell into abeyance until its resumption in 1553. Its abolition, as a result of corrupt electioneering practices, took place in 1832.

During Wat Tyler's insurrection the monastery was besieged by the townspeople, many of whom were executed in consequence. At St Albans the Lancastrians were defeated on the 21st of May 1455, their leader, the duke of Somerset, being killed, and Henry VI. taken prisoner; here, too, Queen Margaret defeated the earl of Warwick on the 17th of February 1461. During the civil wars the town was garrisoned for the parliament. On a printing press, one of the earliest in the kingdom, set up in the abbey the first English translation of the Bible was printed, Victoria County History, Herts, vol. ii.; Peter Newton, The History of the Abbey of St Albans (London, 1793); and Chronicula monasterii S. Albani, edited by H. T. Riley for the "Rolls" series (1863-1876).

ST ALBANS, a city, and the county-seat of Franklin county, Vermont, U.S.A. 57½ m. (by rail) N.N.W. of Montpelier. Pop. (1890) 6239, including 123 foreign-born (13%) (1900) 8036, including 129 foreign-born (14%). St Albans is served by the Central Vermont railway, which has general offices and shops here, and by an electric line connecting with Lake Champlain at St Albans Bay and with Swanton, 9 m. N. The city is built on a plain less than 3 m. from Lake Champlain and about 300 ft. above it; surrounding hills (Aldis and Bellevue) rise still higher and command charming views of the Green Mountains, Lake Champlain and the Adirondacks. Among the prominent buildings are a U.S. customs-house, the city hall, the court house, a public library, a hospital (1882), the Warner Home for Little Wanderers (1882), two Roman Catholic parochial schools and two convents. There are marble quarries in the vicinity, but the surrounding country is devoted largely to dairying. St Albans has a large creamery, manufactures condensed milk and ships large quantities of butter.
The first permanent settlement here was established in 1786; the township of St Albans (pop. in 1900, 1715) was incorporated in 1859, and the larger part of it was chartered as the city of St Albans in 1897. On the 19th of October 1864 Lieut. Bennett H. Young led from Canada about two thousand un-uniformed Confederate soldiers in a raid on St Albans. They looted three banks, wounded several citizens, one mortally, and escaped to Canada, where Young and twelve others were arrested and brought to trial. But they were never punished, and even the $75,000 which had been taken from them on their arrest was returned to them. Later, however, the Canadian government refunded this amount to the banks. In 1866 and again in 1870 the Fenians made St Albans a base for attacks on Canada, and United States troops were sent here to preserve neutrality.

SAINT ALBIN, ALEXANDER CHARLES OMER ROUSSELLIN DE CORBEAU, COMTE DE (1773–1847), French politician, was born in Paris, of a noble Dauphinois family, and was educated at the Collège d'Harcourt. He embraced the revolutionary ideas with enthusiasm. As civil commissioner at Troyes he was accused of terrorism by some, and by the revolutionary tribunal of moderation. He was imprisoned for a short time in 1794. On his release the Citizen Roussellin entered the ministry of the interior, and under the Directory he became secretary-general, and then civil commissioner of the Seine. Attached to the party of Bernadotte, he was looked on with suspicion by the imperial police, and during the later years of the empire spent his time in retirement at Provence. During the Hundred Days, however, he served under Carnot at the ministry of the interior. Under the Restoration he defended Liberal principles in the Constitutions of 1814, and he was a founder. Although he had been a friend since the time of the Revolution, he accepted no office from the monarchy of July. He retired from the Constitutionsnel in 1838, and died on the 15th of June 1847. His chief works deal with the soldiers of the Revolution. They are: Vie de Lasare Hoche (2 vols., 1798); Notice historique sur le général Marbot (1800); M. de Championnel (1866); and notices of others posthumously published by his son, Hortensius de Saint Albin, as Documents relatifs à la Révolution Française... (1873).

ST ALDEGONDE, PHILIP VAN MARNIX, HEER VAN (1538–1598), Dutch writer and statesman, was born at Brussels, the son of Jacob van Marnix, baron of Pottes. He studied theology under Calvin and Beza at Geneva and, returning to the Netherlands in 1560, threw himself energetically into the cause of the Reformation, taking an active part in the compromise of the nobles in 1563 and the assembly of St Trond. He made himself conspicuous by issuing a pamphlet in justification of the iconoclasm which devastated Flanders in 1566, and on Alva's arrival the next year had to fly the country. After spending some time in Friesland and in the Palatinate he was in 1570 taken into the service of William, prince of Orange, and in 1572 was sent as his representative to the first meeting of the States-General assembled at Dordrecht. In 1573 he was taken prisoner by the Spaniards at Maassluis, but was exchanged in the following year. He was sent as the representative of the insurgent provinces to Paris and London, where he in vain attempted to secure the effective assistance of Queen Elizabeth. In 1578 he was at the diet of Worms, where he made an eloquent but fruitless appeal for aid to the German princes. Equally vain were his efforts in the same year to persuade the magistrates of Ghent to cease persecuting the Catholics in the city. He took a conspicuous part in arranging the Union of Utrecht, and in 1583 was chosen burgomaster of Antwerp. In 1585 he surrendered the city, after a 13 months' siege, to the Spaniards. Violently attacked by the English and by his own countrymen for this act, he retired from public life and lived chiefly in Paris. He died in 1590, lived henceforth in Leiden or on his estate in Zeeland, where he worked at a translation of the Bible. He died at Leiden on the 15th of December 1598.

St Aldegonde, or Marnix (by which name he is very commonly known), is celebrated for his share in the great development of Dutch literature which followed the classical period represented by such writers as the poet and historian Pieter Hooft. Of his works the best known is the Roman Bee-hive (De roomsche byen-korf), published in 1569 during his exile in Friesland, a bitter satire on the faith and practices of the Roman Catholic Church. This was translated or adapted in French, German and English. As a poet, St Aldegonde is mainly known through his admirable metrical translation of the Psalms (1580), and the celebrated Wilhelmius van Nassau, one of the earliest and most successful attempts of Holland, is also ascribed to him. His complete works, edited by Lacroix and Quinet, were published at Brussels in 7 vols. (1855–1859), and his religious and theological writings, edited by Van Turenbergen, at Paris, in 5 vols. (1871–1891).

See E. Quinet, Marnix de St Aldegonde (Paris, 1854); Juste, Vie de Marnix (The Hague, 1886); Frédéricq, Marnix en zijne nijverdijen geschichten (Ghent, 1882); Tjalma, Philips van Marnix, heer van St-Aldegonde (Amsterdam, 1896).

ST ALDWYN, MICHAEL EDWARD HICKS BEACH, 1ST VISCOUNT (1837–1902), English statesman, son of Sir Michael Hicks Beach, 8th Bart., whom he succeeded in 1854, was born in London in 1837, and was educated at Eton and Christ Church, Oxford, where he graduated with a first class in the school of law and modern history. In 1864 he was returned as a Conservative candidate for East Gloucestershire, the county in which his estates of Williamstrip Park were situated; and during 1868 he acted both as parliamentary secretary to the Poor Law Board and as under-secretary for the Home Department. In 1874 he was made chief secretary for Ireland, and was included in the Cabinet in 1877. From 1878 to 1880 he was secretary of state for the colonies. In 1885 he was elected for West Bristol, and the Conservative party having returned to power, became chancellor of the exchequer and leader of the House of Commons. After Mr Gladstone's brief Home Rule Ministry in 1886 he entered Lord Salisbury's next Cabinet again as Irish secretary, making way for Lord Randolph Churchill as leader of the House; but troubles with his eyesight compelled him to resign in 1887, and meanwhile Mr Goschen replaced Lord Randolph as chancellor of the exchequer. From 1888 to 1892 Sir Michael Hicks Beach returned to active work as president of the Board of Trade, and in 1895—Mr Goschen being transferred to the Colonial Office—was again returned for West Bristol. In 1899 he lowered the fixed charge for the National Debt from twenty-five to twenty-three millions—a reduction imperatively required, apart from other reasons, by the difficulties found in redeeming Consols at their then inflated price. When compelled to find means for financing the war in South Africa, he insisted on combining the raising of loans with the imposition of fresh taxation; and besides raising the income-tax each year, up to 12. 3d. in 1902, he introduced taxes on sugar and exported coal (1901), and in 1902 proposed the reimposition of the registration duty on corn and flour which had been abolished in 1869 by Mr Lowe. The sale of his Netheravon estates in Wiltshire to the War Office in 1898 occasioned some acrid criticism concerning the valuation, for which, however, Sir Michael himself was not responsible. On Lord Salisbury's retirement in 1902 Sir Michael Hicks Beach also left the government. He accepted the chairmanship of the Royal Commission on Ritualistic Practices in the Church, and did valuable work as an arbitrator; and though when the fiscal controversy arose he became a member of the Free-food League, his parliamentary loyalty to Mr Balfour did much to prevent the Unionist free-traders from precipitating a rupture. When Mr Balfour resigned in 1905 he was raised to the peerage as Viscount St Aldwyn.

ST AMAND-LES-EAUX, a town of northern France, in the department of Nord, at the junction of the Elnon with the Scarpe, 22 m. S.E. of Lille by rail. Pop. (1906), town, 10,105; commune, 14,454. The town has a communal college and a school of drawing, and carries on iron-founding and the manufacture of porcelain, hosiery, chains and nails, but is better known for its mineral waters and mud baths. There are five springs; the water (67° to 72° F.) contains sulphate of lime and sulphur, and deposits white gelatinous threads without smell or taste. The mud baths are of benefit to patients suffering from rheumatism, gout and certain affections of liver and skin. Though from the discovery of statues and coins in the mud it is evident that the town was already ancient during the Roman period, it was only at the close of the 17th century that they again became of more than local celebrity. Of the abbey there remain
an entrance pavilion serving as town hall and the richly decorated façade of the church, both dating from the 17th century.

St. Andrews is an episcopal city of the diocese of St. Andrews and Dunkeld, and was founded as a monastery in the 7th century. The abbey was laid waste by the Normans in 882 and by the count of Hainaut in 1340. The town was captured by Mary of Burgundy in 1477, by the Count of Charleville’s lieutenants in 1519, and finally in 1567 by the French. In 1793 St. Andrews was the headquarters of General Dumouriez in revolt against the Republican government.

ST-AMAND-MONT-ROND, a town of central France, capital of an arrondissement in the department of Cher, 39 m. S. by E. of Bourges on the railway to Montluçon. Pop. (1906), 7711.

The town stands at the foot of the hill of Mont-Rond, on the right bank of the Cher, at its confluence with the Marmande and on the canal of Berry. A church of the period of transition from the Romanesque to Gothic style and several old houses are the more interesting buildings. The beautiful chaîne of Millat, built from 1500 to 1510 by the admiral Charles of Amboise, is 53 m. from St. Amant; and the abbey of Noirac, a fine type of Cluniac monastery with a 12th-century church, is 28 m. from the town.

The town grew up round a monastery founded by St. Amant, a follower of St. Columban, in the 7th century. Its ruined stronghold, on the hill of Mont-Rond, was of importance in the middle ages, and during the Fronde, when it belonged to the great Mont-Rond monastery, it formed a centre of resistance to the royal troops. The place was taken after a siege of eleven months in 1652. It was for a time the property of Sully, who retired to it under the regency of Marie de Médicis.

SAINT-AMANT, MARC ANTOINE DE GÉRARD, SEUR DE (1594-1661), French poet, was born near Rouen in the year 1594. His father was a merchant who had, according to his son’s account, been a sailor and had commanded for 22 years a escadre de la reine Elizabeth—a vague statement that lacks confirmation. His son obtained a patent of nobility, and attached himself to different great noblemen—the duc de Retz and the comte d’Harcourt among others. He was military service and sojourned at different times in Italy, in England, and which provoked from him a violent poetical attack on the country, Albinon (1643)—in Poland, where he held a court appointment for two years, and elsewhere. Saint-Amant’s later years were spent in France; and he died at Paris on the 20th of December 1661.

Saint-Amant has left a not inconsiderable body of poetry. His Albinon and Rome ridicule set the fashion of the burlesque poem, a form in which he was excelled by his follower Paul Scarron. In his Italian sojourn he published La scuola d’amore, an epic, Moisès sauvé (1643). His best work consists of Bacchana-alian songs, his Débauche being one of the most remarkable confidant poems of its kind.

ST ANDRÉ, ANDRÉ JEANBON (1749-1813), French revolutionist, was born at Montauban (Tarn-et-Garonne) on the 25th of February 1749, the son of a fuller. Although his father was a Protestant, St. André was brought up by the Jesuits at Mâcon and took orders. He turned Protestant, however, and became pastor at Castras and afterwards at Montauban.

The proclamation of liberty of worship made him a supporter of the Revolution, and he was sent as deputy to the Convention by the department of Lot. He sat on the Mountain, voted for the death of Louis XVI, and opposed the punishment of the authors of the September massacres. In July 1793 he was president of the Convention, entered the Committee of Public Safety the same month and was sent on mission to the Armies of the East. On the 20th of September 1793 he obtained a vote of one hundred million francs for military purposes, from a district in the Conscript. On 30th January 1794 he reconquered the military harbour of Brest and Cherbourg. In May 1794 he took part with Admiral Villaret de Joyeuse in a fight with the English. Finally, after a mission in the south, which lasted from July 1794 to March 1795 and in which he showed great moderation, he was arrested on the 28th of May 1795, but was released by the amnesty of the year IV. He was then appointed consul at Algiers and Smyrna (1798), was kept prisoner by the Turks for three years, and subsequently became prefect of the department of Mont-Tonnerre (1801) and commissary-general of the three departments to the left bank of the Rhine. He died at Mainz on the 10th of December 1815.

See Lévy-Schneider, Le Conventionnel Jeanbon St André (Paris, 1901).

SAINT, ANDRÉ, JACQUES D’ALBON, SEIGNEUR DE (c. 1595-1652), French soldier and favourite of Henry II. of France. He was made marshal of France, governor of Lyonais and ambassador in England. He served with great bravery against the emperor Charles V. in 1552. In 1557 he was taken prisoner at the battle of Saint Quentin, but was released the following year, and took part in negotiating the peace of Cateau-Cambrésis. After the death of Francis II. he formed in 1561 with the constable de Montmorency and Francis, duke of Guise, an alliance known as “the triumvirate” against the Protestants and the queen-mother. He perished at the battle of Dreux by the hand of a private enemy.

ST ANDREWS, a city, royal burgh, university town and seaport of Fife, Scotland. Pop. (1901), 7621. It is situated on a bay of the North Sea, 12 m. S.E. of Dundee by the North British railway, via Leuchars junction. It occupies a plateau of sandstone rock about 50 ft. high, on the north breaking off in precipitous cliffs in which the sea has worn numerous caves. The Eden enters St Andrews Bay to the north-west of the Links; and Kinness Burn, skirting the south side of the town, flows into the harbour. Almost the whole activity of St Andrews is centred in education and golf. There are a few small businesses, however, such as brewing, tanning, shipping and fishing. The harbour, which is somewhat difficult of access, is protected by a pier 630 ft. long. The city has been called the “Mecca of Golf,” partly because the Royal and Ancient Golf Club, founded in 1754, is the legislative authority of the game, and partly because its beautiful links—acquired by the town in 1894 and containing three courses—rank amongst the finest in the world.

For the sake of the game, the bracing air and the bathing which the sandy beach of its bay affords, visitors are attracted to St Andrews, and some of them own houses in the town. The chief local buildings include the town hall, the Temple’s Hall, the Volunteer Hall, the Gibson Hospital, the Memorial Cottage Hospital, the Marine Biological Station (erected by Dr. C. H. Gatty and opened in 1866), the Library and the Golf Club House, erected in 1853.

The city was never surrounded by walls, and of its ancient gates the West Port only remains. The Martyrs’ Memorial, erected to the honour of Patrick Hamilton, George Wishart, and other martyrs of the Reformation epoch, stands at the west end of the Scores on a cliff overlooking the sea.

The cathedral originated partly in the priory of Canons Regular founded by Bishop Robert (1182-1190). At the end of the 17th century the stone screens of the inferior clergy had been by the actual remains of others existed, but nearly all traces have now disappeared except portions of the priory wall and the archways, known as the Fens. The wall is about three-quarters of a mile long, and bears the mark of the hands of several builders, and a tower building the restoration of the priory, but the work was interrupted by his death in 1900.

The cathedral was founded by Bishop Robert (1150-1162), to supply more ample accommodation than was afforded by the church of St. Rule. Of this church in the Romanesque style, probably dating from the 10th century, there remain the square tower, 108 ft. in height, and the choir, of very diminutive proportions. On a plan of the town, about 1530, a chapel appears, and on seals affixed to the accounts of the work in the latter building, three altars are shown. The cathedral was finished in the time of Bishop Lambert (1297-1328), and was dedicated on the 5th of July 1318, the ceremony being witnessed by Robert Bruce. When entire it had, besides a central tower, six aisles, and of the nave and choir 122 ft. The building was partly destroyed by fire in 1378, and the restoration and further embellishment were completed in 1440. It was stripped of its altar to the end of the 16th century the central tower gave way, carrying with it the north wall. Afterwards large portions of the ruins were taken away for building purposes, and nothing was done to preserve them until 1825. Since then it has been the object of successive care to undertake the cutting out of the ground-plan in the turf. The principal portions extant, partly Norman and partly Early English, are the
east and west gables, the greater part of the south wall of the nave and the west wall of the south transept.

The picturesque ruins of the castle are situated on a rocky promontory much worn away by the sea. It is supposed to have been erected by Bishop Roger about the beginning of the 12th century as an episcopal residence, and was strongly fortified. It was frequently taken by the English, and after it had been captured by the Scottish regent, Andrew Murray, in 1336-1337, was destroyed lest it should become a refuge for the adherents of the cause of the House of Stuart. The castle was rebuilt by Bishop Trail in the form of a massive fortification with a moat on the south and west sides. James I. spent some of his early years within it under the care of Bishop Wardlaw, and it was the birthplace of James III. (1445).

Cardinal Beaton was the builder of George Wishart in front of the gate (1546), and in the same year he was murdered within it by a party of Reformers. The castle was taken from the conspirators by the French, among the prisoners captured being John Knox, who afterwards was imprisoned in it by Archbishop Hamilton, but in less massive and less substantial form. By 1656, however, it had fallen into such disrepair that the town council ordered the materials to be used for repairing the pier. The principal remains are a portion of the south wall enclosing a square tower, the “bottle dungeon” — so named from its shape: it was a cell hewn out of the solid rock—below the north-west tower, the kitchen tower and a curious subterranean passage. The grounds have been laid out as a public garden.

The town church, formerly the church of the Holy Trinity, was originally founded in 1112 by Bishop Turgo. The early building was a beautiful Norman structure, but at the close of the 18th century the tower, the spire and much of the screen of the nave were removed. The spire was re-erected in a plain and unattractive style. In this church John Knox first preached in public (May or June 1547), and in it, on June 4th 1559, he delivered the famous sermon from St Matthew (iv. 19). It was here that the archbishop of Canterbury, John of Rochester, was burned on the 20th of July 1572. The tower is fine, the spire of the central tower of the monastic buildings. The church contains an elaborate monument in white marble to James Sharp, archbishop of St Andrews (assassinated 1679). In South Street stands the lovely ruin of the north transept of the chapel of the University, the foundations of which are all the traces of the Observantine monastery founded about 1450 by Bishop Kennedy have disappeared, except the well.

The great university of St Andrews owes its origin to a society formed in 1410 by Lawrence of Lindores, abbot of Scone, Richard Cornwall, archdeacon of Lothian, William Stephen, afterwards archbishop of Dunblane, and a few others. A charter was issued in 1417 by Bishop Henry Wardlaw (d. 1440), who attracted the most learned men in Scotland as professors, and six bulls were obtained from Benedict XIV. in 1413 confirming the charter and constituting the society a university. The lectures were delivered in various parts of the town until 1430, when Wardlaw allowed the lecturers the use of a building called the Paedagogium, or St John’s. St Salvator’s College was founded and richly endowed by Archbishop Kennedy in 1450. The degrees granted to candidates in theology and philosophy, and by the end of the century were regarded as a constituent part of the university. In 1512 St Leonard’s College was founded by Prior John Hepburn and Archbishop Alexander Stewart on the site of the buildings which at one time were used as a hospital for pilgrims. In the same year Archbishop Stewart nominally changed the Paedagogium into a college and annexed it to the parish church of St Michael of Tarvet; but its actual erection into a college did not take place until 1537, when it was dedicated to the Blessed Virgin Mary of the Assumption. The outline of the ancient structure is preserved, but its general character has been much altered by various restorations. It forms two sides of a quadrangle, the library and principal’s residence being on the north and the lecture rooms and the old dining-hall on the west. The University library, which now includes the older college libraries, was founded about the middle of the 17th century, rebuilt in 1704, and improved in 1829 and 1882. The lower hall in the old Salvator’s College building was used at times as a public meeting-place for the Scottish parliament. When the constitution of the colleges was remodelled in 1579 St Mary’s was set apart for theology; and in 1747 the colleges of St Salvator and St Leonard were formed into the United College. The buildings of St Leonard’s are now occupied as a school for girls. The college chapel is in ruins. The United College occupies the site of St Salvator’s College, but the old buildings have been removed, with the exception of the college chapel, now used as the university chapel and the parish church of St Leonard’s, a fine Gothic structure, containing an elaborate tomb of Bishop Kennedy and Knox’s pulpit; the entrance gateway, with a square clock tower (152 ft.); and the janitor’s house with some class-rooms above. The modern building, in the Elizabethan style, was erected between 1827 and 1847. University College, Dundee, was in 1890 affiliated to the university of St Andrews. This arrangement was set aside by the House of Lords in 1895, but a re-affiliation took place in 1897.

In 1887-1888 a common dining-hall for the students was established; in 1892 provision was made within the university for the instruction of women; and for the board and residence of women students a permanent building was opened in 1896. To the south of the library medical buildings, erected by the munificence of the 3rd marquess of Bute, were opened in 1899.

It was during the principalship of Dr James Donaldson, who succeeded John Tulloch (1853–1886), that most of the modern improvements were introduced.

Madras College, founded and endowed by Dr Andrew Bell (1755–1832), a native of the city, is a famous higher-class school.

The town, which is governed by a council, provost and bailies, gives its name to the district group of burghs for returning one member to parliament, the other constituents being the two Anstruther, Crail, Cupar, Kilrenny and Fife-Western.

Four miles N.W. is Leuchars (pop. 711), the church of which, dating from 1100, contains some beautiful Norman work in the chancel and apse, the nave being modern. It was in this church that Lady Whyte— who was the only surviving member of the family of the Stewarts of Balmerino—was granted by King John (1165) the right to give up Episcopacy. At Guard Bridge (pop. 715), so named from the six-arched bridge erected by Bishop Wardlaw at the mouth of the Eden, are a large paper-mill and brickworks. Mt Melville, the highest point in Fife, lies near the city. Whyte, the birthplace of Sir Robert Ayton the poet (1570–1638). On the shore, to the S.E., stands the huge detached rock which, from its shape, bears the name of the Middle Rock.

History.—St Andrews was probably the site of a Pictish stronghold, and tradition declares that Kenneth, the patron saint of Kennoway, established a Culde monastery here in the 6th century. The foundations of the little church dedicated to the Virgin were discovered on the Kirkheugh in 1860. Another Culde church of St Mary on the Rock is supposed to have stood on the Lady’s Craig, now covered by the sea. At that period the name of the place was Kilrymont (Gaelic, “The church of the King’s Mount”) or Muckross. Another legend tells how St Regulus or Rule, the bishop of Patras in Achaea, was guided hither bearing the relics of Saint Andrew. The Pictish king Angus gave him a tract of land called the Boat Chase, no doubt the Boar hills of the present day, and the name of the spot was changed to St Andrews, the saint soon afterwards (747) becoming the patron-saint of Scotland (but see ANDREWS, SJ). St Andrews is said to have been made a bishopric in the 9th century, and the See of St Andrews (1143) by Murchadh, a disciple of St Columba. St Andrew was united in 908, the primacy was transferred to it from Dunkeld, its bishops being thereafter known as bishops of Alban. It became an archbishopric during the primacy of Patrick Graham (1466–1478). The town was created a royal burgh in 1224. In the 16th century St Andrews was one of the most important ports north of the Firth and is said to have numbered 14,000 inhabitants, but it fell into decay after the Civil War. Defoe says that when he saw it one-sixth of its houses were ruinous and the sea had so encroached on the harbour that it was never likely to be restored; but the slight improvement in trade and public spirit which Bishop Pococke seemed to detect in 1760 continued throughout the 19th century.

SAINT ARNAUD—ST AUGUSTINE

The University of St Andrews: an Historical Sketch (1878); Annual Register of St Andrews University.

SAINT ARNAUD, JACQUES LEROY DE (1801–1854), marshal of France, was born at Paris on the 20th of August 1801. He entered the army in 1817, and after ten years of garrison service, which he varied by gambling and wild courses, he still held only the lowest commissioned grade. He then resigned, led a life of adventure in several lands and returned to the army at thirty as a sub-lieutenant. He took part in the suppression of the Vendée émeute, and was for a time on General (Marshall) Bugeaud’s staff. But his debts and the scandals of his private life compelled him to go to Algeria as a captain in the Foreign Legion. There he distinguished himself on numerous occasions, and after twelve years had risen to the rank of maréchal de camp. In 1848 he was placed at the head of a brigade during the revolution in Paris. On his return to Africa, it is said because Louis Napoleon considered him suitable to be the military head of a coup d'état, an expedition was made into Little Kabylia, in which St Arnaud showed his prowess as a commander-in-chief and provided his superiors with the pretext for bringing him home as a general of division (July 1851). He succeeded Marshal Magnan as minister of war and superintended the military operations of the coup d'état of the 2nd of December (1851) which placed Napoleon III. on the throne. A year later he was made marshal of France and a senator, remaining at the head of the war office till 1854, when he set out to command the French in the Crimea, his British colleague being Lord Raglan. He died on board ship on the 29th of September 1854 shortly after commanding at the battle of the Alma. His body was conveyed to France and buried in the Invalides.

ST ARNAUD, a town of Kara-Kara county, Victoria, Australia, 158 m. by rail N.W. of Melbourne. Pop. (1901), 3566. It is a flourishing town with a fine town hall, a school of mines and the court house, in which sittings of the supreme court are held. There are tanneries, chalk and wood yards, flour and bone-mills in the town, which lies in a gold-mining, pastoral and agricultural district, the mining being chiefly quartz. To the N.W. is some of the finest agricultural land in the colony.

ST AUGUSTINE, a cathedral city and a contributory parliamentary borough of Flintshire, N. Wales, on the Rhyl-Denbigh branch of the London & North-Western railway, about 5 m. from each of these towns. Pop. (1901), 1788. Its Welsh name, Llanelyw, is derived from the Elwy, between which stream and the Clywed it stands. Asaph, to whom the cathedral (one of the smallest in Great Britain) was dedicated, was bishop here after Kentigern’s return hence to Glasgow, and died in 596. The small, irregularly built town has also a parish church (Anglican), remains of a Perpendicular chapel near Ffinnon Fair (St Mary’s Well), a bishop’s house, a grammar school (1882) and almshouses for eight poor widows, founded in 1673 by Bishop Barrow. The hill on which St Asaph stands is Bryn Paulin, supposed to have been the camping-ground of Sucton Paulinus, on his way to Anglesey. The early cathedral, of wood, was burned by the English in 1247 and 1282, and that built by Bishop Anian in the 13th century (Decorated) was mostly destroyed during the war of Owen Glendower in 1402; Bishop Redman’s building (c. 1480) was completed by the erection of the choir about 1770. During the Civil War the Parliamentarians did not spare the building. The choir and chancel were restored, from designs by Sir Gilbert Scott, in 1867–1868, the nave in 1873. The church is plain and unpretentious, and in style chiefly Decorated but partly Early English, with a square tower which has a library of nearly 2000 volumes (some rare); memorials to Bishop Dafydd ab Owain (d. 1502), to Bishop Luxmore (d. 1830), to the poetess Felicia Hemans, a resident near St Asaph (d. 1835); and Perpendicular oak choir stalls. In the neighbourhood is the modern mansion of Bodweddyn, of which the estate was bought by Sir W. Williams, speaker of the House of Commons in Charles II’s time.

ST AUGUSTINE, a city and the county-seat of St John’s county, Florida, U.S.A., in the N.E. part of the state, about 36 m. S.E. of Jacksonville. Pop. (1900) 4272, including 1735 negroes; (1910) 5494; most of the public buildings are the work of those Minories who were settled at New Smyrna, Florida, by Andrew Turnbull in 1769, and subsequently removed to St Augustine. St Augustine is served by the Florida East Coast railway and by the Florida East Coast Canal, an inland waterway from the St John’s river to the Florida Keys.

The city stands on a narrow, sandy peninsula, about 12 ft. above the sea, formed by the Matanzas and San Sebastian rivers, and is separated from the ocean by the northern end of Anastasia Island. St George, the chief street in St Augustine, is only 17 ft. wide, and St George Street, which runs crosswise of the town, has two people may clasp hands. There are many old houses, some of which have balconies projecting above the streets. At its northern end is the old fort of San Marco (now renamed Fort Marion in honour of General Francis Marion), a well-preserved specimen of Spanish military architecture, begun, it is supposed, about 1656 and finished in 1756. The St Francis barracks (now the state arsenal) occupy the site of the old Franciscan convent, whose walls still remain as the first storey. In the military cemetery are buried a number of soldiers who were quartered by the Seminoles near the Great Salt Swamp on the 28th of August 1835. At the end of St George Street and near Fort Marion is the City Gate (two pillars, each 20 ft. high); from this gate a line of earthworks formerly stretched across the peninsula to the Plaza de la Constitucion, in which are an obelisk erected in 1813 to commemorate the Spanish Liberal Constitution of 1821, and a monument (1872) to citizens who died in the Confederate Army. On this square (built in 1849, recently repaired and afterwards rebuilt), often erroneously spoken of as "the slave market"; a Roman Catholic cathedral (built in 1791, burned in 1887, and rebuilt and enlarged in 1887–1888); Trinity church (Protestant Episcopal); office (once the Spanish Consulate); the Alcazar (with large swimming pool and illuminated artesian well), in the Moorish style, and the Alcazar Annex (with a large sun parlour), formerly the Cordova Hotel, designed and built by Franklin W. Smith, in the Hispano-Moorish style, are also contained. Among the city’s public buildings is the Wilson Free Public Library. Another old building houses the collections of the St Augustine Institute of Science and Historical Society, organized in 1884. St Augustine is the seat of the state school for the deaf and the deshabilite.

At St Augustine are car and machine shops of the Florida East Coast railway. Oyster canning and fishing are engaged in to some extent, and cigars are manufactured, but the city is important chiefly for its tourist trade. It has an average of about 1000 a day. The climate is delightful, the mean temperature for the winter months being about 58° F. and for the entire year about 70° F.

St Augustine is the oldest permanent settlement of Europeans in the United States. It was founded by Spanish colonists under the leadership of Pedro Menendez de Aviles, who sighted land here in 1565, on the 28th of August, St Augustine’s day, whence the name. On the 6th of September he landed and began his fortifications. St Augustine’s colonial history is almost identical with the history of Florida (q.v.) under Spanish dominion. In 1568 it was burned by Sir Francis Drake, who captured the fort, and in 1665 it was pillaged by Captain John Davis, an English freebooter. There were frequent conflicts with the English settlements in South Carolina and Georgia, beginning in 1681 with an attack by the Spanish on Port Royal, South Carolina. In 1702 Governor James Moore of South Carolina captured St Augustine, but not the fort; and there were subsequent expeditions under General James Edward Oglethorpe (see GEORGIA). When Florida was ceded to the United States in 1813, nearly all the Spanish inhabitants of St Augustine went to Cuba. Under English control the city prospered, but when the U.S. Florida was re-ceded to Spain, nearly all the English inhabitants left. St Augustine, Florida, Georgia or the West Indies, and it became merely a military post. In 1821 St Augustine, with the rest of Florida, passed under American control. The Spanish inhabitants remained. On the 7th of January 1861, three days before Florida passed her Ordinance of Secession, the small United States garrison was compelled by a state force to evacuate; but on the 11th of March 1862 the fort was
ST AUSTELL, or ST BARTHÉLÉMY, an island in the French West Indies. It lies in 15° 55' N. and 63° 06' W., about 130 m. N.W. of Guadeloupe, of which it is a dependency. It is shaped like an irregular crescent, the horns, enclosing the bay of St Jean, pointing to the N.; its surface is hilly, culminating near the centre in a limestone hill 1003 ft. high. It is 8 sq. m. in area, and devoid of forests, and water has often to be imported from the neighbouring island of St Kitts. The surrounding rocks and shallow lakes make the island difficult of access. Despite the lack of water, sugar, cotton, cocoa, manioc and tobacco are grown. The capital, Gustavia, on the S.W. coast, possesses a small but safe harbour. Lorient is the only other town. The inhabitants, mainly of French and negro descent, are English-speaking, and number about 3000. St Bartholomew was occupied by France in 1648 and ceded to Sweden in 1784. In 1877 it was again acquired by France at the cost of £11,000.

ST BARTHOLOMEW, MASSACRE OF, the name given to the massacre of the Huguenots, which began in Paris on St Bartholomew's Day, 14 August, 1572. It was caused by the hatred of the Catholic populace. From Paris the massacre spread to the provinces till the 3rd of October. The duc de Longueville in Picardy, Chabot-Chabot (son of Admiral Chabot) at Dijon, the comte de Matignon (1525-1597) in Normandy, and some provincial governors, refused to authorize the massacres.

François Hotman estimates the number killed in the whole of France at 50,000. There were many illustrious victims, among them being Admiral Coligny, his son-in-law Charles de Téligny and his daughter Catherine de' Medici received the congratulations of all the Catholic powers, and Pope Gregory XIII. commanded bonfires to be lighted and a medal to be struck.

So Not degli scavi (1891), 81: but the statement is contradicted, ibid. (1894), 44.
many votive-tablets, are in the museum at the hospice of the Great St. Bernard.

See Notizia degli scavi, passim, especially E. Ferrero (1890), 294;
C. Primosi, Antichitá di Aosta (Turin, 1862).

The Little St. Bernard was known to the Romans as Alpis Graia. It derived its name from the legend that Hercules, returning from Spain with the oxen of Geryon, crossed the Alps by this route, though the legend rather suits the route through the Maritime Alps. According to many modern scholars, Hannibal passed this way over the Alps, though the question has been much discussed (see art. HANNIBAL, and Partsch in Pauly-Wissowa, Realencycl. d. Alterthumskunde, i, 604). In any case it was the principal pass over the Alps into Gallia Comata until the pass of the Alpis Cottia (Mont Genèvre) was opened by Constantine in 75 B.C. and became the principal route, though the road was only completed under Augustus by Cottius in 3 B.C. Various remains of the road are visible, and those of a building (possibly a temple of Jupiter) have been found on the summit of the pass.

See Notizia degli scavi (1883), 7 (1894), 46; and C. Primosi, Antichitá di Aosta (Turin, 1862), 115 sqq.

ST BERTRAND-DE-COMMINGES, a village of south-western France at the foot of the Pyrenees in the department of Haute-Garonne. It is situated on the N.W. of the Roman road. St. Bertrand stands about 1 m. from the left bank of the Garonne on the slopes of an isolated hill crowned by its celebrated cathedral of Notre Dame. The façade of the church with its square tower and the first bay with its aisles are Romanesque, and belong to a church begun about the end of the 11th century by Bishop Bertrand (1075-1123), afterwards canonized. The nave with its side chapels and the choir, in the Gothic style, date from the first half of the 14th century and were chiefly the work of Bertrand de Goth, bishop from 1295 to 1320, and after Pope Clement V. The choir screen, roof-loft and altar, which form an enclosure within the church, are masterpieces of Renaissance wood-carving, as are also the choir stalls. The church contains several tombs, the most interesting of which are the fine white marble tomb of Bishop Hugh of Châlillon (d. 1352), and the mausoleum of St. Bertrand (both of the 15th century), whose relics are preserved in the treasury. On the south side of the church there is a ruined cloister of Romanesque architecture.

St. Bertrand-de-Comminges (Ludumini Comenianum) was founded in 72 B.C., and before the end of the 5th century became the seat of a bishopric suppressed at the Revolution. The town was destroyed toward the beginning of the 6th century by Guntram, king of Burgundy, after it had served as a refuge to Conomondal, pretender to the crown of Aquitaine.

SAINT-BON, SIMONE ARTURO (1832-1892), Italian admiral, was born at Chambery on the 20th of March 1832. Leaving the Naval Academy in 1847, he attained the rank of commander in 1860, and that of vice-admiral in 1867. He took part in the Crimean war, distinguished himself in 1856 at the siege of Ancona, and was decorated for valor at the siege of Gaeta. At the battle of Lissa, in 1866, his vessel, the "Formidabile," forced the entrance of the port of San Giorgio and silenced the Austrian batteries, for which exploit he received a gold medal. In 1873 he was elected deputy, and appointed by Mazzini to the minister of marine, in which position he revolutionized the Italian navy. Insisting upon the need for large battleships with high powers of attack and defence, and capable of fighting as single units, he introduced the colossal types of which the "Duilio" and the "Dandolo" were the earliest examples. Falling from power with the Right in 1876, he resumed active service, but in 1891 was again appointed minister of marine. He died on the 26th of November 1892, while still in office. He is remembered in Italy as the originator of the modern Italian fleet.

ST BRIEUC, a town of western France, capital of the department of Côtes-du-Nord, 63 m. N.W. of Rennes by the railway to Brest. Pop. (1906) town 15,270; commune 23,041. It stands 290 ft. above the sea, between and m. 2 m. from the English Channel and less than a mile from the right bank of the Gouët, at the mouth of which is its seaport, Le Légué. St. Brieuc is the seat of a bishopric in the province of Rennes, and has a cathedral dating from the 11th century, but partially rebuilt in the 15th, and afterwards extensively restored. In the interior the tombs of the bishops and a Renaissance organ- loft deserve mention. The oldest part of the episcopal palace date back to the 12th century. The hôtel-de- ville contains a museum and picture gallery. An Ursuline convent serves as barracks. There are numerous houses of the 15th and 16th centuries, in one of which James II., king of England, is said to have lodged in 1689. A colossal statue of the Virgin looks down upon the town from an eminence on the north, and there is a statue of St. Guiscrin. The industries include wool-spinning, timber-saving, iron and steel working, and the manufacture of brushes and agricultural implements.

St. Brieuc owes its origin and its name to the missionary St. Bricius, who came from Wales in the 5th century, and whose tomb afterwards formed the focus of a church. The town was founded in 1375 by Olivier de Clisson against the duke of Brittany, and again attacked by the same Clisson in 1394, the cathedral suffering greatly in both sieges. In 1502 the town was pillaged by the Spaniards, in 1601 ravaged by the plague, and in 1628 surrounded by soldiers which left no traces remain. Between 1602 and 1768 the states of Brittany several times met at St. Brieuc. During the Reign of Terror Chouans and Republicans carried on a ruthless conflict with each other in the vicinity. The ancient fort of Péran, built of vitrified granite, is about 5 m. S. of St. Brieuc.

ST CATHARINES, a city of Ontario, Canada, and the capital of Lincoln county, in the Welland Canal and the Grand Trunk, and St. Catharines and Niagara Central railways, 33 m. S. of Toronto, with which it has steamboat connexion. Pop. (1901) 9046. It is connected by electric trams with the neighbouring towns and villages, and is in the midst of a fine fruit-growing district. Its excellent water-power provides motive force for numerous industries, among which are flour-mills and factories for the manufacture of edge tools and agricultural implements. Bishop Ridley College, under Anglican control, is an important residential school. There are mineral springs which are much visited by invalids.

ST CHAMOND, a manufacturing town of east-central France, in the department of Loire, 74 m. E.N.E. of St. Étienne, on the railway from St. Étienne to Lyons. Pop. (1906) 14,147. The town was founded in a tidal island owned by mountains at the confluence of the Janon with the Gier, an affluent of the Rhone. It has coal-mines forming part of the Rive-de-Gier basin. The milling of raw silk, the manufacture of ribbons and laces of every kind, dyeing and the construction of naval and railway material are the foremost industries. There are also metal-foundries, manufactories of nails, heavy iron goods, looms and other industrial establishments.

St. Chamond, founded in the 7th century by St. Ennemond or Chamond, archbishop of Lyons, became the chief town of the Jarret, a little principality formed by the valley of the Gier. Silk-milling was introduced in the town in the middle of the 15th century by Gayotti, a native of Bologna. Remains are found at St. Chamond of a Roman aqueduct which conveyed the waters of the Janon along the valley of the Gier to Lyons.

ST CHARLES, a city and the county-seat of St Charles county, Missouri, U.S.A., situated on the N. bank of the Missouri river, about 20 m. above its mouth, and about 23 m. N.W. of St. Louis. Pop. (1905) 43,744. It was first settled by the Wabash and the Missouri, Kansas & Texas railway systems, and by an electric railway to St. Louis. A great steel bridge, 6355 ft. long (built 1868-1871), crosses the river and gives entry to the Wabash railroad from St. Louis. It has three spans of 305 to 321 ft., which at the time of their construction were the longest of their kind in the world. A highway bridge also crosses the river, and is the only waggon bridge between Jefferson City and the mouth of the river. At St. Charles are a Presbyterian school for women (Lindenwood College); St. Charles Military College (Methodist Episcopal, 1837), the Academy of the Sacred Heart (1858); St. Joseph’s Hospital, and the Emmaus Asylum for Epileptics. St. Charles has important car works (among the largest in the United States), a large shoe factory, flour mills, brick and tile yards and breweries. St. Charles county is very fertile, and its yield of wheat is especially large. At the sand works at Kinlocke, in the southern part of the county, large quantities of silica are blasted, crushed, bolted and shipped.

A French settlement was begun at St. Charles in 1769, and soon
thereafter a Spanish official was placed in residence. St Charles was organized as a village under territorial law in 1809, and in 1849 was chartered as a city. It was the first capital of the state (1820-1826).

**Saint Clair**, a borough of Schuykill county, Pennsylvania, U.S.A., on Mill Creek, 3 m. N. of Pottsville, and about 40 m. by rail N.N.W. of Reading. Pop. (1910) 6,455. Saint Clair is served by the Pennsylvania and the Philadelphia & Reading railways. It is engaged chiefly in the mining (very largely surface-stripping) and shipping of anthracite coal, and in the manufacture of miners’ supplies. Saint Clair was settled in 1825 and was incorporated as a borough in 1850.

**St Clair**, a lake and river of North America, forming part of the boundary between the state of Michigan, U.S.A., and the province of Ontario, Canada. The lake is 20 m. long and 20 broad. It contains numerous islands, receives from the Canadian side several rivers, the largest of which is the Thames, and is drained into Lake Erie by the Detroit river. At its foot are the cities of Detroit (Michigan) and Windsor (Ontario). On the north it receives the St Clair river, the outlet of Lake Huron. The shores of both lake and river are flat, and their waters shallow, but, owing to the enormous traffic which passes through them, they have been in great part canalized, and can accommodate the largest steamers.

**St Claude**, a town of eastern France, capital of an arrondissement in the department of Jura, 42 m. S.E. of Lons-le-Saunier by rail. Pop. (1906) 9,558. The town is beautifully situated 300 ft. above sea-level at the western base of Mont Bayard, among the heights of the eastern Jura at the confluence of the Bienne and the Tacon. The latter river is crossed by a fine suspension bridge. The cathedral of St Pierre, once the abbey-church, a building of the 14th to the 18th centuries, contains fine 15th-century stalls and a reredos of the Renaissance period. The town is the seat of a bishop, suffragan of Lyons, and of a sub-prefecture. St Claude has been noted since the close of the middle ages for its fancy articles in horn, tortoise-shell, hardwood, ivory, &c., and there are manufactures of briar-root pipes. Diamond-cutting and lapidary work and the manufacture of measures are also prosperous industries.

The town derives its name from that of an archbishop of Besançon who died in the 7th century in the monastery founded here in the 5th century. This monastery subsequently acquired almost independent sovereignty in the locality, and held its retainers in a state of servitude till the Revolution. Voltaire pleaded the cause of the serfs, though unsuccessfully, before the parlement of Besançon, and in memory of his services a statue was erected to him in 1887. St Claude was constituted a bishopric in 1762. The abbey-buildings and most of the town were destroyed by fire in 1799.

**St Cloud**, a town of northern France, in the department of Seine-et-Oise, on the left bank of the Seine, 2 m. W. of the fortifications of Paris by road. Pop. (1906) 73,316. Picturesquely built on a hill-slope, St Cloud overlooks the river, the Bois de Boulogne and Paris; and, lying amid the foliage of its magnificient park and gardens, as well as the delights, it is one of the favourite resorts of the Parisians. The palace of St Cloud, which had been a summer residence for Napoleon I., Louis XVIII., Charles X., Louis Philippe and Napoleon III., was burned by the Prussians in 1870 along with part of the village. In spite of the damage inflicted on the park at the same period its magnificent avenues and ornamental water still make it one of the pleasantest spots in the neighbourhood of Paris. Every year in September, at the time of the pilgrimage of St Cloud, a fair lasting four weeks is held in the park. Within its precincts are situated the national Sèvres porcelain manufactory and the Breteuil pavilion, the seat of the international commission on the metre. St Cloud possesses a modern church in the style of the 12th century with an elegant stone spire; and here, too, is established the higher training college for male teachers for the provincial training colleges of primary instruction.

Clodoald or Cloud, grandson of Clovis, adopted the monastic life and left his name to the spot where his tomb was discovered after the lapse of 1300 years, in a crypt near the present church. He had granted the domain to the bishops of Paris, who possessed it as a fief till the 18th century. At St Cloud Henry III. and the king of Navarre (Henry IV.) established their camp during the siege of the church of Sainte-Geneviève; and there the former was assassinated by Jacques Clément. The castle was at that time a plain country house belonging to Pierre de Gondi, archbishop of Paris; in 1658 it was acquired by the duke of Orleans, who was the original of the palace which perished in 1870. Peter the Great of Russia was received there in 1717 by the regent, whose grandson sold the palace to Marie Antoinette. It was at St Cloud that Bonaparte executed the coup d'état of 18th Brumaire (1799); after he became emperor the palace was his favourite residence, and there he celebrated his marriage with Marie Louise. In 1815 it was the scene of the signing of the capitulation of Paris; and in 1830 from St Cloud Charles X. issued the orders which brought about his fall. Napoleon III. was there when he received the senator-consult which restored the empire in his favour (1st December 1852). Seized by the Prussians at the beginning of the investment of Paris in 1870, St Cloud was saved during the siege.

**St Cloud**, a city in Stearns, Benton and Sherburne counties, Minnesota, U.S.A., and the county-seat of Stearns county, about 65 m. N.W. of Minneapolis, on both banks of the Mississipi river, and about 730 ft. above sea-level. Pop. (1900) 8,865, of whom 1907 were foreign-born; (1910 U.S. census) 10,600. It is served by the Great Northern and the Northern Pacific railways. It is the seat of one of the State Normal Schools (1869), and of the Minnesota State Reformatory (1887). In the city are a Carnegie library, a Federal building, a Roman Catholic cathedral, St Raphael’s Hospital (Roman Catholic), St Clotilda’s Academy of Music and two business colleges. The Mississipi has a considerable fall here, and provides valuable water-power. Among the manufactures are flour, barrels, bricks, and foundry and machine-shop products—the Great Northern maintains extensive car and repair shops here. In 1905 the value of the city’s factory product was $1,994,476, an increase of 27.8% over 1900. There are large lumber yards, and excellent grey and red granites (St Cloud is called “the Granite City”) from neighbouring quarries are exported. The city lies in a large grain-growing and stock-raising district. St Cloud was settled in 1852, platted in 1853, incorporated as a village in 1868, and chartered as a city in 1889. Until reached by the Great Northern railway, St Cloud was the Hudson’s Bay Company’s terminus for the unloading of furs from the wooden ox-carts (“Red river” carts).

**St Croix or Santa Cruz**, the largest island in the Danish West Indies. It lies 65 m. S.E. of Puerto Rico, in 17° 46' N. and 64° 14' W., is 22 m. long, varies in breadth from 1 m. to 6 m., and has an area of 84 sq. m. Pop. (1901) 18,595. Parallel with the western coast is a range of hills, culminating in Mount Eagle (1164 ft.). The narrower western part is also hilly, but on the S. shore there are marshy tracts with lagoons of brackish water. Sugar is the staple product, and near Christiansted there is a large sugar-refinery. The planters are generally of British birth, mostly English, and their language predominates. The capital, Christiansted (locally known as “Bassin”), is situated at the head of an inlet on the N. coast, but its harbour is to a large extent choked with mud. It is a picturesque town, and the seat of the Danish governor during half the year. The only other town, Frederiksted, stands on an open roadstead on the W. coast. It is locally known as “West End,” and part of the town, wrecked by the blacks in 1878, lies in ruins. The climate is healthy, the mean annual temperature being 74° F. and the average rainfall 45.7 in. per annum.

St Croix was discovered in 1493 by Columbus, and was owned in turn by the Dutch, British and Spanish. In 1651 it was taken by France, and two years later was given to the Knights of Malta by Louis XIV. In 1733 it was purchased by Denmark. Slavery was abolished in 1848 after a violent insurrection which had broken out among the slaves.

SAINT-CYRAN, a French Benedictine abbey in the province of Berry, now comprised in the department of the Loiret. From 1620 to 1643 it was held by the famous Jansenist reformer, DuVivier (1572-1622), who was consequently often spoken of by French writers as the Abbé de Saint-Cyran.

ST CYR-L'ECOLE, a town of northern France in the department of Seine-et-Oise, 3 m. W. of Versailles at the end of the old park of Louis XIV. Pop. (1806) 2696. Its importance is due to the famous military school (école spéciale militaire) in which officers for the cavalry and infantry are trained. It was established in 1808 in the convent which Madame de Maintenon founded for the education of noble young ladies in poor circumstances. Racine's Esther and Athalie were first acted here, having been written expressly for the pupils. Madame de Maintenon's tomb is still preserved in the chapel. The convent was suppressed at the Revolution, and the gardens are now partly transformed into parade-grounds.

ST DAVIDS (Tivydew), a cathedral town of Pembroke-shire, Wales, situated near the sea to the S.E. of St David's Head, the most westerly promontory of South Wales. Pop. (1901) 1763. St David's is 10 m. distant from the station of Letterston on the Great Western railway. St David's is a most important of ecclesiastical Princely status. It is largely built of a beautiful purple-hued sandstone, which is quarried locally. Its proportions are: length (exclusive of the Trinity and Lady chapels), 284 ft.; breadth of nave and aisles, 64 ft.; height of tower (the 12th c. tower) 105 ft.; height of central tower, 116 ft. In spite of the antiquity of its foundation, the earliest and main portion of the existing fabric was erected under Bishop Peter de Lely (1175-1198) in the transitional Norman-English style. Bishop Henry de Gower (1328-1347), one of the greatest of ecclesiastical builders in Wales, made many additions in the Decorated style, including the stone rood-screen and southern porch of the Lady Chapel. Bishop William of Wyche (1464-1480) erected the Lady Chapel between the choir and Lady Chapel. Under the last-named prelate the magnificence of St David's reached its height, but owing to the changes during the Reformation and the unsensational state of its restoration the original elevation, height, and proportion of the building have suffered severely; nor was it spared later during the Civil Wars, when the Lady Chapel, the aisles of the presbytery, and even the transepts were unroofed and partially dismantled. In 1793 the cathedral was repaired by Thomas Nash, who rebuilt the western front in a debased Perpendicular style. The work of much-needed restoration was carried out throughout the latter half of the 19th century, especially between 1862 and 1869, when Sir Gilbert Scott undertook the task. The work cost £43,500. A large amount of incongruous work was replaced by a new arcade intended to harmonize with the original design of Bishop de Lely, and at the beginning of the 20th century the Lady Chapel and Bishop Vaughan's chapel were replaced by a new Lady Chapel, and of Deans Allen and Phillips. The exterior of the nave (by six wide bays from the aisles, is singularly imposing with its triforium and clerestory windows. It possesses a elaborate roof of Irish oak, the gift of Treasurer Owen Pole (c. 1500). The nave is divided from the choir by an arcade of six piers. Above the arcade the choir itself contains the richly carved stalls erected by Bishop Tully (1460-1481), the episcopal throne, and an elegant oaken screen that serves to separate choir and presbytery. The painted roof and the wainscoting of the chapel are the work of bishops Tully and Richard Martin, Treasurer Owen Pole and other benefactors. The eastern wall of the choir has been greatly altered by the addition of modern Venetian mosaic designs in the original lower trilights of light, and by the insertion of lancet windows in the Perpendicular window of the 15th century. Bishop Vaughan's chapel contains fine Tudor fan vaulting, and the Lady Chapel good decorated sedilia. The cathedral, before the Reformation, was remarkably rich in sculptured tombs and monuments, but many of these have perished and all the brasses have disappeared. In the presbytery stands prominent the altar tomb with modern brasses inserted of Edmund Tudor, earl of Richmond (d. 1456), father of King Henry VII. Among the other surviving monuments, all most of which are the work of John of Gaunt and Bishop Adam Houghton in 1377.

On the west bank of the Alun stands the splendid and indeed unique ruin of the episcopal palace erected by Bishop Gower (c. 1340) and destroyed by the Reformation. It is not, however, for defence, Bishop Gower's ecclesiastical mansion is "essentially a palace and not a castle; and it is hardly too much to affirm that it is altogether unsurpassed by any existing English edifice of its kind."

The Close, 18 acres in extent and extra-parochial, contains the deanery and other residences of the cathedral clergy, mostly occupying a building of 16th-17th c. date, which was added in 1856. The imposing Church of the Holy Trinity and open cloisters are two ways of which the South or Tower Gate alone remains. The whole of the wild and bleak but picturesque neighbourhood of St David's teems with legendary and historical associations, and cromlechs and barrows of the most ancient kind lie scattered in the parishes of St Justinian (Capel Stinnan) and St Non being the most remarkable.

History.—At some unknown period in the 7th century the celebrated patron saint of Wales, Dewi or David, removed the chief seat of South Welsh ecclesiastical life to Menveia or Menapia (Mynwy), which is traditionally reported to have been the saint's birthplace. The site chosen for this new foundation was the marshy valley of the Alun—the Vallis Rosina of medieval historians—and this spot became known henceforth as Tyddewi or St Davids. The dread of an imminent Anglo-Saxon invasion of Gwent, the determination to remove his monastic clergy from court influence, and the desire of opening closer communication with the sister Churches of Ireland, are among the various reasons suggested for David's remarkable policy, which made St Davids the leading religious centre in South Wales for nearly a thousand years. From the 7th to the 11th centuries the successors of St David occasionally ventured to exercise metropolitan rights over South Wales, and even over all land west of the Severn, and the character and extent of these early claims have been the subject of speculation or controversy among historians, some of whom have not hesitated to designate the early Celtic holders of the see by the title of "archbishop." These ill-defined claims were destroyed by St Anselm's forcible appointment of the Norman monk Bernard to the bishopric in 1115, from which date to the present timeSt Davids has rank as a suffragan see of Canterbury; nor has its ancient independence ever been seriously asserted, save by the intrepid Gerald de Barri (Giralduis Cambrensis), who vainly strove from 1199 to 1203 to induce Pope Innocent III. to acknowledge the power of the cathedral chapter to elect its own bishops without reference to English king or primate. St Davids early became a place of pilgrimage, and amongst the many supplicants who visited St David's shrine were William the Conqueror, Henry II. and Edward I. with Queen Eleanor. Probably with a view to conciliate the native clergy for Anselm's unpopular policy in Wales, Henry I. obtained from Pope Calixtus II. the canonization of St Davids and the granting of indulgences to pilgrims to St Davids were vaguely supposed to be equivalent to one journey to Rome itself: a sentiment preserved in the curious monkish hexameter:

"Roma semel quenta bis dat Menevia tantum."

From 1115 to the Reformation the see was held by prelates
ST DENIS—ST DIZIER

1021

(many of them natives of Wales) who did much to enrich and beautify the vast group of ecclesiastical buildings in the Close. But with the partial destruction of the palace and the removal of the episcopal residence to Abergwilli, it was not long before St Davids sank into a mere monument of its former splendour and importance. In 1539 Bishop Barlow even petitioned Thomas Cromwell for permission to remove the see itself to Carmarthen, a request which tradition declares Henry VIII. refused to grant solely out of respect for the memory of his grandfather Edmund Tudor, whose tomb had recently been taken from the suppressed priory of Grey Friars at Carmarthen and set up before the high altar of the cathedral. During the 17th and 18th centuries all the ancient buildings of the Close, except the cathedral (which served also as a parish church for the village of St Davids), were allowed to fall into hopeless ruin. Amongst the 119 bishops who have held the see since its foundation by St David may be mentioned Asser, the friend of King Alfred (d. 906); Samson (10th century), honoured by the Welsh chroniclers with the proud title of "Archbishop of the Isle of Britain"; Rhydderch (d. 1066), the first biographer of St David; Henry de Gower (d. 1147), the well-known patron of art; Robert Ferrer burned at Carmarthen in 1555 under Queen Mary; Richard Davies (d. 1581), patriot and translator of the Welsh Book of Common Prayer; Archbishop William Laud, bishop of the see between 1621 and 1627; George Bull, divine (d. 1710); and Conno Bartholomew, scholar and historian (d. 1875). The title official of the bishops of St Davids is Episcopus Menensis. (H.M.V.)

ST DENIS, an industrial town of northern France, capital of an arrondissement in the department of Seine, 5 m. N. of Paris. Pop. (1906) 62,332. St Denis, an important junction on the northern railway, stands in a plain on the right bank of the Seine, which is here joined by the canal of St Denis. It has numerous metallurgical works, where railway material, naval engines and the like are constructed, distilleries of spirits, glassworks, potteries and manufactories of drugs, chemical products, oils, nickel plate and pianos. The name and fame of the town are derived from the abbey founded by Dagobert I. on the spot where St Denis, the apostle of Paris, was interred. The abbey buildings, occupied by a school for daughters of members of the Legion of Honour, founded by Napoleon I., date from the 18th century.

The church exhibits the transition from the Romanesque to the Gothic style. The church was begun between 1065 and 1077. The right-hand tower is almost pure Romanesque; that on the left was Gothic, and its spire was carried to a height of 280 ft., but it was struck by lightning in 1837 and reconstructed in so clumsy a manner that it has been reduced to the level of the clerestory. The north nave. The rose window, now occupied by a clock face, dates from the 13th century. Under one of the three rows of arches above the main entrance runs an inscription recording the erection of the church between 1065 and 1077. The church contains some remains of the basilica of Pippin the Short and Charlemagne, by whom the church was rebuilt. The nave proper (235 ft. long and 57 wide) has seven bays, as dates, as well as many of the choir and transepts, on the right of St Louis. The secondary apse (rondpoint) and its semicircular chapels (consecrated in 1144) are considered as the first perfected attempt at Gothic. The transept has fine façades, the towers of the choir having been finished towers; if the plan had been fully carried out there would have been six towers besides a central spire in lead. The church contains a series of tombs of the kings and princes of the royal houses of France, and is one of the most splendid tombs of the Renaissance, executed under the direction of Philibert Delorme (1550-1560); and that of Dago- bert, which, though considerably dilapidated, ranks as one of the most important of those of the 14th century. The crypt contains some stained glass of the time of St Louis remains. The crypt dates partly from the 10th or 11th century. In the centre is the vault of the apse of the church, now used for the crypt. Its upper part is constructed of the same materials as the other parts of the church. The crypt was only partially finished when it was consecrated in 1066. It was also partially destroyed by fire in 1095, 1155, 1554 and 1757. Funds for the rebuilding of the portion of the town destroyed by the last fire were supplied by Stanislas, last duke of Lorraine.

ST DIZIER, a town of north-eastern France, in the department of Haute-Marne, 45 m. N.N.W. of Chaumont by rail, on the Marne and the Haute-Marne canal. Pop. (1906) town, 10,316; commune, 14,661. The town is a very important centre of the iron trade, with foundries, forgings and engineering.
works, and has traded in grain and timber. It dates from the 3rd century, when the relics of Bishop St Didier (whence the name of the town) were brought thither after the destruction of Langres by the Germans. It sustained a memorable siege against Charles V. in 1544.

**STE ANNE DE BEAUPRÉ**, a post-town of Montmorency county, Quebec, Canada, at the junction of the Ste Anne river with the St Lawrence, and on the Quebec, Montmorency & Charlevoix railroad, 22 m. below the city of Quebec. It stands in a rolling agricultural country, with hills in the background; and near by, on the Ste Anne river, are beautiful falls and excellent fishing. For over two centuries Ste Anne has been known as a Roman Catholic place of pilgrimage, and many miracles are still said to be performed through the intercession of the saint, the mother of the Virgin. In the basilica, an ornate building, are ever-increasing piles of crutches and other aids, cast aside by the cured. The resident population is about 1500, chiefly composed of hotel-keepers and members of religious orders, but throughout the year many pilgrimages are made, and on such days as the feast day of Ste Anne (26th of July) 30,000 people are often present. The total number of pilgrims in 1905 was 70,000. The cityshell and the basilica containing numerous religious edifices, the chief being the Scala Santa, built in imitation of the Holy Stairs at Rome.

**SAINTE-BEUEHE, CHARLES AUGUSTIN** (1804-1869), French critic, was born at Boulogne-sur-Mer (No. 16 Rue du Pot d’Étain) on the 23rd of December 1804. He was a posthumous child, his father, a native of Picardy, and controller of town-dues at Boulogne, having married in this same year, at the age of fifty-two. The father was a man of literary tastes, and used to read, like his son, pencil in hand; his copy of the Elzevir edition of Virgil, covered with his notes, was in his son’s possession, and is mentioned by him in one of his poems. Sainte-Beuve’s mother was half English, her father, a mariner of Boulogne, having married an Englishwoman. The little Charles Augustin was brought up by his mother, who never remarried, and an aunt, his father’s sister, who lived with her. They were poor, but the boy, having learnt all he could at his first school at Boulogne, persuaded his mother to send him, when he was near the age of fourteen, to finish his education at Paris. He boarded with a M. Landry, and had for a fellow-boarder and intimate friend Charles Neate, afterwards fellow of Oriel College and member of parliament for the city of Oxford. From Landry’s boarding-house he attended the classes, first of the Collège Charlemagne, and then of the Collège Bourbon, winning the head prize for history at the first, and for Latin verse at the second. In 1823 he began to study medicine, attending lectures on anatomy and physiology and walking the hospitals. But meanwhile a Liberal newspaper, the *Globe*, was founded in 1827 by Paul François Dubois, one of Sainte-Beuve’s old teachers at the Collège Charlemagne. Dubois called to his aid his former pupil, too, now quitting the study of medicine, contributed historical and literary articles to the *Globe*, among them two, which attracted the notice of Goethe, on Victor Hugo’s *Odes et ballades*. These articles led to a friendship with Victor Hugo and to Sainte-Beuve’s connexion with the romantic poets of society, a school never entirely suited to his nature. In the *Globe* appeared also his interesting articles on the French poetry of the 16th century, which in 1828 were collected and published, and followed by a second volume containing selections from Ronsard. In 1829 he made his first venture as a poet with the *Vie, poésies, et pensées de Joseph Delorme*. His own name did not appear; but Joseph Delorme, that “Wether in the shape of Jacobin and medical student,” as Guizot called him, was the Sainte-Beuve of those days himself. About the same time within Quebec, the *Revue de Paris*, and Sainte-Beuve contributed the opening article, with Boileau for its subject. In 1830 came his second volume of poems, the *Consolations*, a work on which Sainte-Beuve looked back in later life with a special affection. To himself it marked and expressed, he said, that epoch of his life to which he could with most pleasure return, and at which he could like best that others should see him. But the critic in him grew to prevail more and more and pushed out the poet. In 1831 the *Revue des deux mondes* was founded in rivalry with the *Revue de Paris*, and from the first Sainte-Beuve was one of the most active and important contributors. He brought out his novel of *Adolphe* in 1843, his history of the *Pensées de d’Oc*, in 1857. He himself thought that the activity which he had in the meanwhile exercised as a critic, and the offence which in some quarters his criticism had given, were the cause of the less favourable reception which this volume received. He had long meditated a book on Port-Royal. At the end of 1837 he quitte France, accepting an invitation from the college of Lausanne, where in a series of lectures his work on Port-Royal came into its first form of being. In the summer of the next year he returned to Paris to revise and give the final shape to his work, which, however, was not completed for twenty years. In 1840 Victor Cousin, then minister of public instruction, appointed him one of the keepers of the Mazarin Library, an appointment which gave him rooms at the library, and, with the money earned by his pen, made him for the first time in his life easy in his circumstances, so that, as he afterwards used to say, “I bought myself, not to spend, but to lead the life of a scholar.” A more important consequence of his easier circumstances was that he could study freely and largely. He returned to Greek, of which a French schoolboy brings from his lycée no great store. With a Greek teacher, M. Pantasides, he read and re-read the poets in the original, and thus acquired, not, perhaps, a philological scholar’s knowledge of them, but a genuine and invaluable acquaintance with them as literature. His activity in the *Revue des deux mondes* continued, and articles on Homer, Theocritus, Apollonius of Rhodes, and Meleager were fruits of his new Greek studies. He wrote also a very good article in 1844 on the Italian poet Leopardi; but in general his subjects were taken from the great literature which he knew best, that of his own country—its literature both in the past and in the contemporary present. Seven volumes of *Portraits*, contributed to the *Revue de Paris* and the *Revue des deux mondes*, exhibit his work in the years from 1832 to 1848, a work constantly increasing in range and value. In 1844 he was elected to the French Academy as successor to Casimir Delavigne, and was received there at the beginning of 1845 by Victor Hugo.

From this settled and prosperous condition the revolution of February 1848 dislodged him. In March of that year was published an account of secret-service money distributed in the late reign, and Sainte-Beuve was put down as having received the sum of one hundred francs. The smallness of the sum would hardly seem to suggest corruption; it appears probable that the money was given to cure a smoky chimney in his room at the Mazarin Library, and was wrongly entered as secret-service money. But Sainte-Beuve, who piqued himself on his independence and on a punctilious delicacy in money matters, was indignant at the entry, and thought the proceedings of the minister of public instruction and his officials, when he demanded to have the matter sifted, tardy and equivocal. He resigned his post at the Mazarin and accepted an offer from the Belgian government of a chair of French literature in the university of Liége. There he gave the series of lectures on Chateaubriand and his contemporaries which was afterwards (1860) published in two volumes. He liked Liége, and the Belgians would have been glad to keep him; but the attraction of Paris carried him away.

Sainte-Beuve was at this time a devoted Catholic and a little later for a very short period a disciple of Lamennais. But he gradually separated from his Catholic friends, and at the same time grew friendly with Victor Hugo. He became the lover of Madame Hugo, and a definite separation between the former friends ensued in 1834.

3. A friend of Madame Récamier, at whose house he met Chateaubriand. He became an especially close friend of Louis Mathieu, Comte Molé, for whose niece, Mme d’Arbouville, he conceived a lasting attachment.

4. Chateaubriand et son groupe littéraire sous L’Empire.
him back there in the autumn of 1849. Louis Napoleon was then president. Disturbance was ceasing; a time of settled government, which lasted twenty years and corresponds with the second stage of Sainte-Beuve's literary activity, was beginning. Dr Véron, the editor of the Constitutionnel, proposed to him that he should supply that newspaper with a literary article for every Monday; and thus the Causeries du lundi were started. They at once succeeded, and "gave the signal," as Sainte-Beuve himself says with truth, "for the return of letters".

Sainte-Beuve now lived in the small house in the Rue Montparnasse (No. 11), which he occupied for the remainder of his life, and where in 1850 his mother, from whom he seems to have inherited his good sense, tact and finesse, died at the age of eighty-six. For three years he continued writing every Monday for the Constitutionnel; then he passed, with a similar engagement, to the Moniteur. In 1857 his Monday articles began to be published in volumes, and by 1862 formed a collection in fifteen volumes; they afterwards were resumed under the title of Nouveaux lundis, which now make a collection of thirteen volumes more. In 1854 he was nominated to the chair of Latin poetry at the college of France. For the first time his name was received with interruptions and marks of disapprobation by many of the students, displeased at his adherence to the empire; at a second lecture the interruption was renewed. Sainte-Beuve had no taste for public speaking and lecturing; his frontis mollites, he said, unfitness for it. He was not going to carry on a war with a party of turbulent students; he proposed to resign, and when the minister would not accept his resignation of his professorship resigned his emoluments. L'étude sur Virgile, a volume published in 1857, contains what he had meant to be his first course of lectures. He was still a titular official of public instruction; and in 1858 his services were called for by Gustave Roulland, then minister of public instruction, as a lecturer (maître de conférences) on French literature at the École Normale Supérieure. This work he discharged with assiduity and success for four years. In 1859 he was made commander of the Legion of Honour, having twice previously to 1848 refused the cross. During the year of his official engagement his Monday contributions to the Moniteur had no longer been continuous; but in 1862 an arrangement was proposed by which he was to return to the Constitutionnel and again supply an article there every Monday. He consented, at the age of fifty-seven, to try this last pull, as he called it, "ce dernier coup de collier;" he resigned his office at the École Normale and began the series of his Nouveaux lundis. They show no falling off in vigour and resource from the Causeries. But the strain upon him of his weekly labour was great. "I am not a monsieur nor a gentleman," he writes in 1864, "but a workman by the piece and by the hour." "I look upon myself as a player forced to go on acting at an age when he ought to retire, and who can see no term to his engagement." He had reason to hope for relief. Except himself, the foremost literary men in France had stood aloof from the empire and treated it with a hostility more or less bitter. He had not been hostile to it; he had accepted it with satisfaction, and had bestowed on its official journal, the Moniteur, the lustre of his literature. The prince Napoleon and the princess Mathilde were his warm friends. A senatorship was mentioned; its income of £1600 a year would give him opulence and freedom. But its coming was delayed, and when at last in April 1865 he was made senator, his health was seriously compromised. The disease of which he died, but of which the doctors did not ascertain the presence until his body was opened after his death—the stone—began to distress and disable him. He could seldom attend the meetings of the senate; the part he took there, however, on two famous occasions—when the nomination of Ernest Renan to the college of France came under discussion in 1867, and the law on the press in the year following—provoked the indignation of the great majority in that conservative assembly. It delighted, however, all who "belonged," to use his own phrase, "to the diocese of free thought;" and he gave further pleasure in this diocese by leaving the Moniteur at the beginning of 1869, and contributing to a Liberal journal, the Temps.1 His literary activity suffered little abatement, but he found a manner to sit to write; he could only stand or lie. He died in his house in the Rue Montparnasse on the 13th of October 1869.

The work of Sainte-Beuve divides itself into three portions—his poetry, his criticism before 1848 and his criticism after that year. His novel of Volupté may properly go with his poetry.

We have seen his tender feeling for his poetry, and he always maintained that, when the "integrating molecule," the foundation of his whole method, was not present, he could not make poetry; he could not even recognize a poetic character. And yet he declares, too, that it is never without a sort of surprise and confusion that he sees his verses detached from their context and quoted in public and in open day. They lose, then, indeed, the part of a secret, which, says Sainte-Beuve, indeed, the radical inadequacy of French poetry. It is to English poetry that he resorts in order to find his term of comparison, and to award the praise which to French poetry he refuses. "Since you are fond of the poets," he writes to a friend, "I shall like to see you read and look for poets in another language, in English for instance. There you will find the most rich, the most dulcet and the most new poetic literature. Our French poets are for the most part, too poor in ideas even when they have the talent for strophe and line; to hold and occupy for long a serious mind."

But, even as French poetry, Sainte-Beuve's poetry had faults of its own. Its faults were in the manner in which it was written. It is a poetry "narrow, puny and stilted," and its style "slowly dragging and laborious." Here we touch on a want which must no doubt be recognized in him, which he recognized in himself, and whereby he was probably even more his master than his master. From some highly inspired note and in giving their full measure—some want of flame, of breath, of pinion. Perhaps we may look for in a confession of his own: "I have my weaknesses; they are those which gave to King Solomon his disgust with everything and his fatal hatred of life. It extinguished my fire, but I did not pervert my heart." It is enough for us to take his confession that he extinguished or impaired his fire.

Yet, this poetry is characterized by merits which make it readable still and readable by foreigners. So far as it exhibits the endeavour of the romantic school in France to enliven the vocabulary of poetry and to give greater freedom and variety to the alexandrine, it has little to do for the present. It has done far more for the French people; but was entirely characteristic of Sainte-Beuve. All his poetry has this stamp of direct dealing with common things, of plain unpretending reality and sincerity; and this stamp at that time made it, as Sainte-Beuve said, "abominable poetry, but a poetry of the people.

It has been the fashion to disparage the criticism of the Critiques et portraits, with what reservedness we should read them. They are to be considered, he says, "rather as a dependency of the elegiac and romanesch type of my work than as express criticisms. They have the copiousness and the warmth of spirit of a commonplace book handed over by a friend of the young. It is not a life in later life Chateaubriand, Lamartine, Victor Hugo more coolly, judged them differently. But the Critiques et portraits contain a number of articles on personages, other than contemporary writers, critics and poets, which are as the best works of the master.

Nay, his soberness and tact show themselves even in this earlier stage of his criticism, and even in treating the objects of his too fervid youthful enthusiasm. A special object of this was Victor Hugo, whose first book had been published, but with an air of the most precise reserve and the most abashed humility. The name of Victor Hugo was not, says Sainte-Beuve, unknown in these provinces, but we have certainly plenty of enthusiasm, plenty of exuberance. We have the epithets "adorable," "sublime," "supreme," given to Victor Hugo's poetry; we are told of "the majesty of his high and sombre philosophy." But the article next

1This course of action definitely separated him from the Bonapartist partisans and led to a quarrel with Princess Mathilde. —[Ed.]
SAINTE-BEUVE

following this, and written only four years later, in 1835, is the article of a critic, and takes the points of objection, seizing the weak spots of the Montaignan, and hitting them at once. The sonorousness, the "artificial," the "voulu," the "théâtral," the "violent," as distinctly as the author of the Coiseries could seize it. "The Frank, energetic and subtle, who has mastered to perfection the technical and rhetorical resources of the Latin literature of the decadence," is not the same, however, in the second, and it is with the "artificiel," the "souriant," that Sainte-Beuve launches it in this article, written when he was but thirty years old, and still a painter of "portraits de jeunesse" only.

He had thus been steadily working and growing; nevertheless, 1848 is an epoch which divides two critics in him of very unequal value. When, after that year of revolution and his stage of seclusion and labour at Liège, he came back to Paris in the autumn of 1849 and commenced in the Constitutionnel the Coiseries du lundi, he was astonishingly matured. Something of fervour, enthusiasm, poetry, he may have lost, but he had become a perfect critic—a critic of measure, not exuberant; of the centre, not provincial; of keen industry and curiosity, with "Truth" (the word engraved on his head) for his motto; moreover, with gay and amiable temper, his manner as good as his matter—the "critique souriante," as, in Charles Monselet's dedication to him, he is called.

The root of everything in his criticism is his single-hearted devotion to truth. What he called "fictions" in literature, in politics, in religion, were all exactly the same word to him; and it was on his being tenacious of a certain set of literary opinions—"I hold very little," he answers, "to literary opinions; literary opinions occupy very little place in my life and in my thoughts. What does occupy me seriously is life itself and the object of it."—that made him, necessarily, with his gifts, the great critic of his time, and gave him a certain power over the masses. "It is my business to re-cast my opinions the moment I suspect them to be without validity." "What I have wished" (in Port-Royal) "is to say not a word more than I thought, to stop even a little short of what I believed in certain cases, in order that my words might acquire more weight as historical testimony." To all exaggeration and untruth, from whatever side it proceeded, he had an antipathy: "I turn my back upon the Michelets and Quinets, but I cannot hold out my hand to the Veuillots.

But Sainte-Beuve could not have been the great critic he was had he not had, at the service of this his love of truth and measure, the conscientious industry of a Benedictine. "I never have a holiday. On Monday towards noon I lift up my head, and breathe for about an hour; after that the wicket shuts again and I am in my prison cell for seven days." The Coiseries were at this price. They came once a week, and to write one of them he wrote it was indeed a week's work. The "irresponsible indolent reviewer" should read his notes to his friend and provider with books, M. Paul Chérond of the National Library. Here is a note dated the 2nd of January 1853: "Good-day and a happy New Year. To-day I set to work on Grimm. A little dry; but after St François de Sales" (his Monday article just finished) "one requires a little relief from controversy. Le Monde a bit out of the question for this time, I write to Tascereau. I have also the Memoirs of Madame d'Epinay, where there are many letters of his. But it is possible that there may be notices of him mentioned in the bibliographical book of that German whose name I have forgotten. I should like, too, to have the first editions of his Correspondance; they came out in successive parts." Thus he prepared himself, not for a grand review article once a quarter, but for a newspaper review once a week.

His adhesion to the empire caused him to be represented by the Orleanists and Republicans as without character and patriotism, and to be charged with baseness and insincerity. The Orleanists had, in a great degree, the possession of the higher press in France and of English opinion—of Liberal English opinion more especially. And with English Liberals his indifference to parliamentary government was indeed a grievous fault in him; "you Whigs," as Croker happily says, "are like quack doctors, but they have one specific for all constitutions." To him either the doctrine of English Liberals, or the doctrine of Republicanism, applied absolutely, was what he called a "fiction," one of those fictions which "always end by obscuring the truth." Not even on M. de Tocqueville's authority would he consent to receive "les hypothèses dites les plus honorables"—"the suppositions which pass for the most respectable. All suppositions he demanded to sift, to see them at work, to know how they had been applied. He might have applied the same to the France before his eyes in 1849 he thought that something "solid and stable"—"un mur," "a wall," as he said—was requisite, and that the government of Louis Napoleon supplied this wall. But no one judged the empire more independently than he did, and his characteristic against it was the application of the word to a real state of things. "The Frenchmen who attached themselves to the empire were, he said, as indeed they had been, in the habit of suspecting and denouncing its faults more clearly; he described himself as being, in his own single person, "the gauche of the empire," and the description was just.

To these merits of mental independence, industry, measure, lucidity, his criticism adds the merit of happy temper and disposition. Goethe long ago noticed that, whereas Germans reviewed one another as enemies whom they hated, the critics of the Globewere reviewed one another as gentlemen. This arose from the higher social development of France and from the closer relations of literature with life there. But Sainte-Beuve has more, as a critic, than the external politeness which once at any rate distinguished his countrymen; he has a personal charm of manner due to a sweet and humane temper. He complained of un peu de dureté, "a certain dose of hardness," in the new generation of writers. The personality of an author had a peculiar importance for him; the poetical side of his subjects, however latent it might be, always attracted him, and he always sought to extirpate it. This was because he had the moderate, impartial spirit of a true literary man. For him, literature was an art which might be profaned even by a monarch, as long as it remained true to its nature. Let me beg of you," he says in thanking a reviewer who praised him, "to alter one or two expressions at any rate. I cannot bear to have it said that I am the first in anything whatever, as a writer least of all; it is not a thing which can be admitted, and these ways of blaming people give offense. A literary man allows himself to be judged by his work, and not by his manners. Let us return to the Academy as he was, he can yet write to an old friend after his election: "All these academies, between you and me, are pieces of childishness; at any rate the French Academy is. Our last quarter of an hour of solitary reverie or of serious talk, yours and mine, in our youth, was better employed; but, as one gets old, one falls back into the power of these nothings; only it is well to know that nothing they are."

Perhaps the best way to get a sense of the value and extent of the work done in the last twenty years of his life by the critic thus excellently endowed is to take a single volume of the Coiseries du lundi, to look through its list of subjects, and to remember that with the qualities above mentioned all these subjects are treated. Any volume will serve; let us take the fourth. This volume consists of articles on twenty-four subjects. Twenty of these are the following: Mirabeau and Sophie, Montaigne, Mirabeau and Comte de la March, Mademoiselle de Scudéry, André Chénier as a politician, Saint-Evremond and Ninon, Joseph de Maistre, Madame de Lambert, Madame Necker, the Abbé Maury, the Duc de Lauzun of Louis XVI.'s reign, Marie Antoinette, Buffon, Madame de Maintenon, De Bonald Amoy, Mallet du Pan, Marmontel, Chatillon, Rulhière, Almost every personage is French, it is true; Sainte-Beuve himself is French, which makes them pretty familiar. The great place of France in the world is very much due to her eminent gift for social life and development; and this gift French literature has accompanied, fashioned, perfected, and continues to reflect. And nowhere shall we find such interest more completely and charmingly brought out than in Sainte-Beuve's Coiseries du lundi and the Nouvelles lundis. As a guide to a knowledge of the French genius and literature he is unrivalled.

AUTHORITIES.—See his "Ma Biographie" in Nouvelles lundis, xii., Lettres de la presse (1873); Correspondance (1877-1878) and Nouvelles Correspondance (1886); the Vicomte d'Haussonville's Sainte-Beuve (1875); Scherer, Études sur la littérature contemporaine, iv.; G. Michaut, Sainte-Beuve avant les Lundis (1903). Sainte-Beuve's centenary was celebrated in various ways; for centenary criticism see the Edinburgh Review (April 1905) ("Sainte-Beuve and the Romantics"); Monthly Review (April 1905) (by F. Brunetière); Revue des Deux Mondes (March 1905) (by Victor Giraud). In the Œuvres choisies de Juste Olivier (1879) are some "Souvenirs"; and in 1903 the Revue des Deux Mondes published several interesting articles on a correspondence of Sainte-Beuve with Olivier.
